G. R. WILEY, of Shawnee, Me.,

L. E. WILSON, of Honea Peth, S. C., March 31st.

FRANKLIN WINGER, of Ephrata, Pa., aged forty-seven years.

Alexander Richard Lewis, secretary of the firm of Johnson & Johnson, of New Brunswick, N. J., died at his home at Metuchen, N. J., April 9th, at the age of sixty years.

Arthur Edmunds Jenks, secretary of the Hanson-Jenks Company, of this city, died April 24th, aged forty-seven years.

Where Is Herbert B. Richardson?

Julius S. Velle, National Soldiers' Home, Tenn., wishes to communicate with Herbert B. Richardson, who about ten years ago was a naval apothecary in the service of the United States. Mr. Velle wants Mr. Richardson's aid in completing a claim for a pension. Any information relating to the whereabouts of Mr. Richardson sent to Mr. Velle will be gratefully received.

W. A. Gray Missing.

Almost two months ago William A. Gray, an aged druggist, of Washington, D. C., disappeared from a hospital in that city, and at the time of a recent report no trace of him has been found. The relatives of the missing man have offered a reward for information as to his whereabouts, furnished to his brother-in-law, G. B. Chew, 1606 Thirteenth street, N. W., Washington.

M. M. Osborne, of Elkins Park, Pa., applied himself to the subject of "Skin, Hair, Teeth, and Toilet" in his advertising folder for February, and set forth concisely and doubtless convincingly the superior usefulness of his line of preparations and accessories for enhancing the beauty of the hair and complexion, preserving the teeth, and generally aiding and supplementing natural attractiveness. He did not forget a postscript anent the high quality of the stock of his prescription department.

The druggists of Dayton, Wash., have entered into and made public an agreement that they will "discontinue to dispense or carry in stock all such liquors as brandies, wines and whiskies or other spirituous or malt liquors—alcohol excepted." Their action has received the public endorsement of the doctors of the city.

"The Stores," which have been giving our British brethren so much trouble, are to invade this city and country. The United Stores Association, with headquarters at Broadway and Thirty-first street (Steiner Building), New York, has been incorporated to do a retail co-operative business in all lines of merchandise, including drugs.

After having conducted it for more than forty years, J. D. A. Hartz, of College Point, N. Y., early in April sold his business to E. N. E. Klein, who had been associated with him for many years.

The Druggists Circular

Entered at the New York Post Office as second-class matter.

ESTABLISHED 1857.

Published monthly at
100 William street, New York, by
THE DRUGGISTS CIRCULAR,
William O. Allison, President and Treasurer.
D. G. Bogert, Secretary.

Address all communications to The Druggists Circular.

Subscription Rates.

For the United States and Mexico, TWO DOLLARS PER YEAR; if paid in advance, ONE DOLLAR AND FIFTY CENTS. Foreign and Canadian subscriptions, \$2 a year, payable in advance. Remittances should be made by Check, Express Order on New York, Post Office Order or Draft on New York, payable to The Druggists Circular.

Net Advertising Rates.

	3 months.	6 months.	12 months.

One-Twenty-fourth Page.....	19	33	56
Card 2½x7½ inches.....	11	19	33

Special prices are charged for preferred positions. Changes for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue. No order given to any representative of this paper becomes binding until approved by the publisher or manager. Questionable or undesirable advertisements will not be accepted.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms; invariably cash with order.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER 6

NEW YORK, JUNE, 1911.

WHOLE NUMBER 654

Defining the Scope of the Food and Drugs Act.

Failure was the government's lot in the recent coca-cola case largely because of excessive elaboration in the interpretation of the food and drugs act by those entrusted with its enforcement. Statutory law is a thing of pharaseology. The time to arrange the application of a law is when it is in the formative state, when it is receiving consideration at the hands of the law-makers. A statute of seemingly most comprehensive scope oftentimes takes on a very constricted appearance when viewed, as the courts must view a statute, as a word-contained provision for a definitely stated purpose. Hence it is that zealous combatters of the evil at which an act is aimed, frequently have their case topple over because the superstructure of their contentions was too large for the base.

With all its seeming comprehensiveness, the food and drugs act falls far short of reaching the ultimate in the prevention of fraud and sophistry in aliments and medicines. Certain stated things and these alone are forbidden by this statute. Some there have been who have not hesitated to proclaim the act as the terminator of all adulteration in food and drugs, whereas its scope for the greater part extends only to the wording of labels. And now comes a decision under the law that restricts its provisions to the bare wording of the actual label and assigns the impression that would be created by a label to a place without the scope of the statute. This decision was pronounced by Justice Veeder in the suit of the federal government against the American Druggists' Syndicate, one count of which had to do with the question of whether "peroxide cream" was a misnomer for a toilet preparation containing a very small proportion of hydrogen dioxide. As has been customary in cases of the sort, the government's contention was that through the use of the name "peroxide" the prospective purchaser was led to believe that the cream represented the properties of hydrogen dioxide, to an appreciable extent, and that, because the amount of hydrogen dioxide present was "insignificant," the label was misleading. A number of cases have been successfully prosecuted under the act on similar contentions, but Justice Veeder, before whom the case under consideration was argued, held that a label to be "false or misleading in any particular" must be false or misleading in a particular definitely specified in section eight of the act. In other words,

to constitute an infraction of the act the labeled drug must be an outright imitation of the product under whose name it is sold, or the contents of the package as originally marketed must have subsequently been sophisticated so as to deceive, or the label must fail to bear a correct statement of the amount of alcohol, opium, or other proscribed drug contained in the preparation.

Doubtless there are jurists who will differ with Justice Veeder in his limited interpretation of the phrase "false or misleading in any particular," although his ruling seems to be strictly in keeping with the letter of the law—and that marks the boundary of the statute. If this ruling is to stand, it is to be hoped that the act be amended so as to extend its scope, because, although it may be legal, it is not just to permit the exploitation of a "powerful strychnine tonic" containing only the small proportion of strychnine necessary to produce a bitter taste or respond to a chemical test. The strength of the nostrum "faker" lies more in the implications of his craftily worded labels and circulars than in any direct statements therein.

In this same case arose also the question of the relation of the act to unsubstantiated claims of therapeutic value. The ruling of the court on this point followed that in the case against Johnson in the matter of the misbranding of a "cancer cure," the learned justice opining that the act disclosed no purpose to hold manufacturers or venders to criminal responsibility for misstatements as to the curative or remedial effects of a medicinal preparation. Apparently this opinion was also influenced by the closely defined view the court took with regard to the interpretation of the qualifying phrase "in any particular." The Johnson case is pending in a higher federal court. If the outcome is an approval of the lower court the scope of the food and drugs act will have shrunk considerably from its original apparent extent, and a revision of its phraseology will be the duty of those to whom sophistry is sophistry whether by word, indirect statement, or implication.

Out of the peroxide cream case came a decision on still another moot point: the definition of the label. The government had included among the statements which it alleged were false and misleading those contained in a circular accompanying the container of the cream and enclosed in the same carton. These, in the court's opinion, not being in sight of the prospective purchaser could have no influence upon him and could not induce the sale of the preparation. And,

therefore, the term "label" was defined as a "statement, design or device affixed to an article."

It is to be hoped that an early definition of the terms of the act will be pronounced by the court of last resort; and it is desirable that this definition take cognizance of the purpose of the framers of the act and give the public the benefit of a liberal interpretation. Otherwise there is important work cut out for those whose desire it is to elevate our legal standards for drugs to the level of the best. A statute hampered by infirmities of phraseology and hindered by a lack of definiteness serves no worthy purpose well. There can scarce be conceived a purpose more laudable than that of safeguarding the ailing; then should the statute by which this purpose is sought to be attained be characterized by that solidity, that simplicity, that clarity which are the strength of the common law.

What of Pharmacopœial Revision?

What was the purpose of the recommendation made by the 1910 pharmacopœial convention to the general committee of revision, which reads: "It is recommended that the general committee of revision make public for comment and criticism an abstract of new descriptions and standards and of changes in descriptions and standards proposed, before final adoption"? Was it placation? Of course this recommendation, in common with the others included in the declaration of general principles to govern the revision, is a recommendation, nothing more. Its terms are not binding upon the committee if that body sees fit, as seems to be the case, not to be bound. Why, then, the approval of the recommendation?

We learn that the pharmacopœial trustees met in annual session at the home city of pharmacopœial revision, early in the past month. We are told that the sub-committee on scope made its final report. Has even a whisper transpired as to the limitations imposed by the sub-committee? None, at least loud enough to be heard at this distance. But, some one may say, scope is not a thing with which the recommendation is concerned; that has to do with descriptions and standards. Granted that, under a strict literal interpretation of the recommendation, what of the work done upon the tentative list of pharmacopœial articles submitted by the sub-committee on scope six months ago? And we are to have our new Pharmacopœia next year! So at least we have been promised by the powers that be. That leaves but little time for consideration to be given by critics to proposed changes or additions, to say nothing of time for the consideration of criticisms by the committee of revision.

So far as present indications are a guide, the committee of revision as a body and the members as individuals have shown a decided preference for silence with regard to their work. Unnecessary secrecy, it has been agreed by the members of the committee, is not becoming in connection with work of such a public character as is the revision of the legal

drug standards. We believe that the majority of those who are affected by the requirements of the Pharmacopœia will agree with the committee in this. But we cannot believe that many will subscribe to the opinion, seemingly indicated by the facts, that complete secrecy is necessary. There can be little, if any, question that universal participation is not conducive to good work of any particular sort. However, as the committee is bound in no way, not even by a recommendation, to heed criticism, let us have the light of the drug world upon the revision deliberations. This light cannot blind the eyes of the ardent workers, but it can do much to relieve the committee from future charges of star-chamber tactics.

The Reading and Discussion of Papers at the Meetings of State Associations.

Scarcely in any other way can the benefit of attendance at the meeting of a State pharmaceutical association be pointed out as thoroughly as by the presentation at the sittings of papers on subjects that confront the retail druggist in his vocation. True it is that one of the chief aims of the State organizations is the legislative uplifting and protecting of the calling of the members. Nevertheless, druggists are as a class apathetic to the endeavors to legislate for or against them that are always on foot; and so it is that of those who attend the meetings of the association of their State it is the minority that display an interest in the discussion of legislative matters. This is not because these discussions may not be fraught with interest for each and all druggists, but because the advantages or otherwise of the movement under consideration are not patent, and will not be to many of those affected until they become an established fact under the enforcement of the law or are lost because of half-hearted efforts put forth in behalf of the measure.

But the man who sees it set forth on the programme for the meeting that Charles Casserole will read a paper telling how he made profitable the selling of insecticides, spices, toilet wares, or what-not will at once recognize the advantage of learning Casserole's method, later to consider its application in his own business. The solution of the stamp-customer problem, a satisfactory delivery system, working formulas, publicity plans, and the odd hundreds of things that have a greater or less direct influence upon the bank balance, these are the matters in which no druggist can forget he has an interest; and these as the subjects of papers will bring members to the meetings and keep them at the sittings even while the picture man is endeavoring to group them as an advertisement for the headquarters hotel. It was in recognition of this truism that among the committees of State associations provision has been made in most cases for a committee on papers. The results of the efforts of this committee have not, however, always been encouraging to the members who have served thereon. Frequently it has been complained, now in this association, again in that, that, after the committee has induced some competent member to

devote his time to the preparation of a paper to be read before the association the author has cooled his heels while the sittings were occupied in the grinding of axes, the argument of differences of a more or less private nature, and the plain consumption of time by some outsider or insider with a verbose burden he would rid himself of—and the paper, representing time and thought and replete with benefit for all who might hear it, is at best “read by title.” Does the author hasten magnanimously to repeat his experiment?

In some associations they order these things differently; and here we turn instinctively to the Pennsylvania Pharmaceutical Association. No one can contend that the Keystone State law-makers are neglectful of affairs pharmacal; neither can it be shown that that State is far from the van in the matter of its pharmacy laws. The Pennsylvania association does not hold protracted meetings; but it does find time for the reading of papers, and the committee on papers, encouraged by the recognition extended to its efforts, is keen to merit additional praise. Ample evidence of this fact is given by the list of subjects submitted each year to the members at large, which list for 1911 is printed in the news pages of this issue. Other associations of far less numerical strength have, too, a goodly showing of papers at their annual gatherings. And they profit thereby. It behooves every State organization to foster in every way this feature of the interchange of beneficial ideas, for therein lies an important aid toward making the meetings more attractive.

To assist the State association in this direction the committee on commercial interests of the American Pharmaceutical association is by the by-law creating it instructed to “propose each year a subject for discussion at the meetings of the State associations.” This instruction seems to have fallen somewhat into disregard; but this year, under the chairmanship of F. M. Apple, of Philadelphia, Pa., the committee has submitted the following subject, one of much interest:

Does the general public appreciate why it should patronize pharmacists in return for the manifold benefits it enjoys as the result of unselfish efforts put forth by pharmacists to protect it from incompetents, impostors, adulterators and exploiters? If not, what means can you suggest whereby the public may be interested in the claims of the pharmacists for preferential consideration in commercial transactions?

With this as an impetus, we should have an awakening of interest in discussions of every-day drug-store problems which cannot but serve to make the meetings of the State associations attractive to greater numbers of the rank and file of the members and redound to the advantage of the organizations.

Fixing Responsibility for Error.

Hidden deep in a tangle of verbiage there is in one of the Turley bills now in the legislature of this State the commendable purpose to fix definitely the responsibility for error in the dispensing of prescribed medicaments. The measure is a good example of attempts at pharmacal law-making by extra-pharmacal inter-

ests. It would in practice tend to defeat rather than accomplish the purpose for which it is evidently intended because it would increase the chance for error through the copying and recopying of prescriptions that it requires. There is no need for the provision requiring semi-annual reports as to the whereabouts of registered pharmacists, as the pharmacy law already accomplishes the object sought by requiring annual reports—and the mobile, irresponsible clerk is as little liable to stay six months in one place as he is to stay a year. Another superfluous provision of the Turley bill is the duplication of the pharmacy law's requirement that all prescriptions be kept on file for a term of years. To give this, that and the other person entrance to the druggist's prescription file, as this bill would if it became a law, would be to open the way to fraud and persecution and to demoralize the prescription business. These files are answerable to subpoena; they should be sacred from the prowling muck-raker and scandal-monger.

One thing stands out clear in the midst of the mud-dle of repetition and verbosity; that is the provision that the person filling a prescription shall write his name and the date on the prescription if he is a registered pharmacist and that the supervising pharmacist shall sign prescriptions dispensed by unlicensed employees. So far so good; but the attempt is made to make the proprietor of a drug store criminally responsible for the errors of the unlicensed employee. Seemingly the metropolitan daily newspaper at whose instigation the bill was drafted, the attorneys who are the alleged constructors of the bill, and the legislator whose name it bears overlooked the point that criminal responsibility is a personal thing. There also seems to have been a minimum of consideration bestowed upon the fact that the determining of error is a question for the jury and the burden of proof rests with the plaintiff. It is a difficult matter to show to the satisfaction of a jury that injury was done by a specified drug, that that drug was present in the medicine alleged to have been wrongly compounded, that it was not put there after the container had gone beyond the control of the dispenser, and that the medicine was compounded by the defendant. It would help some if the identity of the compounder were assured. And for this purpose the pharmacy law could easily be amended so as to require the initials and license number of the compounder or the supervisor to be written with the date upon the prescription or in a book kept for the purpose. A dozen or so words, and the thing is done.

We submit this suggestion to the New York State Pharmaceutical Association; and we recommend its consideration to the sponsors of the unwieldy Turley bill.

CERTAIN MILK FERMENT TABLETS having been found by Metchnikoff to contain injurious bacilli, and the keeping of these ferments in tablet form being regarded by him as unwise, he proposes that the general government take charge of the matter, citing its supervision of the serum industry as a precedent. Some of the milk-souring tablets on the market he believes do more harm than good.

BUSINESS METHODS often are the main factor in establishing the popularity of a preparation. It frequently is the case that the druggist who had an equal opportunity with the proprietor of a rapid seller, but who was lacking in business methods, tries to profit at the expense of his more business-like competitor by endeavoring to sell some "just-as-good" preparation when he receives calls for the popular article. This is not substitution, as many of the proprietors of the popular remedies shout, but it is poor business—poor because it alienates customers, and poor because it shows that the druggist who practices it is lacking in the enterprise necessary to launch a preparation of his own and create a demand for it. We are prompted to make these observations by a letter received from a correspondent whose request for a formula for a certain kind of shampooing liquid was answered in a recent issue of the CIRCULAR. Some time after the publication of the formula in question, the correspondent wrote us that he had made up a five-gallon batch of the liquid, samples of which he had distributed among his customers; "and," he added, "I have had nothing but good reports from the same." Parenthetically it may be mentioned that although the formula and directions for making just the kind of preparation requested were worked out in our own laboratory, the work involving the making of numerous original experiments, they were printed, along with other matter from the CIRCULAR, in another drug journal with no semblance of acknowledgment of the source of any of them. With the enterprise which he is exhibiting in this matter, and the courtesy which he shows to be a part of his nature by expressing his thanks to us for the aid we have rendered him, the druggist who is marketing the special shampooing liquid will doubtless soon establish it as a popular favorite in his vicinity. The man whose business methods result in the popularization of a specialty is in a better position with respect to the trade in that article than is he who tries to detract from the fame of the specialty for obviously selfish reasons. The time for the druggist to suggest to people that they try one of *his* specialties is before they have asked him for some one's else, not afterward. He should do his suggesting in such way that his customers will specify his special make of an article when they come to buy. For a druggist to wait until a shopper asks for something else and then try to induce him or her to buy an "own-make" preparation, is to put himself to a decided disadvantage in the estimation of his public, and not infrequently by so doing he drives customers away from his store. By what we here say we do not mean to advocate secrecy in pharmacy—and much less in medicine—or to intimate that it is not the druggist's duty to warn people of the harmfulness of any preparation for which they may ask him.

WHAT IS A SPORT? We are not now talking about games, recreations or fun; nor have in mind the man who is a "good loser" or the one whose large diamond and noisy clothes proclaim that he is not the kind that goes into games in which he stands a chance of losing. The kind of sport we want to call to our aid now is thus described in the dictionary: "An animal or plant, or one of its parts, that exhibits or is the result of sudden and spontaneous variation from the normal type." And yet we are not thinking exactly biologically, either, but of a turn of mind, the human, the editorial, mind. Maybe if we are considered the

"animal," and our mind as "one of its parts," the definition of a sport may be stretched to apply to the sudden variation from normal which we are about to manifest. To get down to the point: It is a fact well known to all who read the papers that anonymous communications to a paper are filed in the editor's waste basket. So far as we know, there has never been a case recorded of a periodical soliciting anonymous communications. Such a thing seems preposterous, seems to break over all newspaper rules and traditions. It frightens the editor who thinks of it to such an extent that he hardly dares to set down the few words which will shatter long-cherished precedents. But time and space are valuable, so we must stop consuming them and say what we felt that we should like to say when we began to write this paragraph. To do so is like taking a dose of castor oil, or a cold shower, or something like that: one fights off the fateful moment as long as he can, and then shuts his eyes, holds his breath and——. Well, here goes: We want as many of our readers as can do so to favor us with anonymous letters about the CIRCULAR. We want them to tell us what they think of it, what its good features are, what its short-comings. We solicit candid expressions of opinion as to what, if anything, it should drop, and what take up. If anyone has a grievance against the CIRCULAR, which he is unwilling to state over his own name, now is a chance for him to rid his mind of it and be sure of a respectful hearing, no matter what its nature. We do not object to complimentary letters; they warm the cockles of our heart in a way which we feel some writers do not appreciate. We receive many such and thank their writers for them. But it does a man or a paper good to hear some adverse comments now and then. We have asked for candid expressions before, but not anonymous ones, and received candied ones instead. It seems that either our friends thought we were fishing for compliments, or else nobody had any adverse criticism to make, but it may have been that there were disgruntled ones who did not wish to write what they had on their minds and sign the statement. We have stood a lot and are in better shape now than ever; we believe we can stand a lot more. Let our readers put us to the test, and if they write in good faith, although anonymously, we hope to be in better shape after they are through with us than we are now. If we did not have this much confidence in ourselves we should not give this evidence of our sportiveness.

STAMP-TAXING OF NOSTRUMS and other ready-made medicines, as well as remedies, and correctives for dermatologic blemishes, perfumes and dentifrices, for purposes of revenue is being considered by congress. The indications are that the measure which embodies this proposition will be allowed to sleep through the tariff activities, and that, should reciprocal trade arrangements be decided upon, the stamp-tax will be enacted as a means of replenishing Uncle Sam's coffers.

DRUG CLERKS may be divided into three classes—first, those who have not "made good" in the position they hold and are always on the lookout for better jobs; second, those who have "made good" in the positions they hold, and are "turning down" offers of other jobs; third, all the rest.

Building Up a Business in Photographic Goods.

BY BILLEE BARRIE.

It all had its beginning when T. Wymbleton Clarke and I were conversing through a rainy April evening with our chairs tilted back against the stock closet doors and the interruptions of trade few and far between. T. Wymbleton was proprietor, editor and star reporter of the *Jeffersonian Standard*, a man of many parts and boundless horizon. He was holding forth on a scheme for metropolitanizing this four-page weekly. My part, as was usual in these frequent conversations, was in the second act after T. Wymbleton had talked himself out. Meanwhile I waited, and with a purpose, for I glimpsed an opportunity, in the theorized metamorphosis, to do a bit of expanding myself.

When the subsequent silence had become portentous, I hazarded the opinion that a few well-selected illustrations of local color would help the *Standard* toward the "yellow" stage. T. Wymbleton agreed, all too readily I thought; then he put the damper on by adding: "A few out of Photographer Lewis' show case, I reckon."

Here was my opportunity. Easily and deliberately, with neither undue emphasis nor the air of one who has hit upon a sure thing, I told the man of many parts how in exchange for more advertising space allotted to me he could add a bang-up focal-plane-shuttered rapid-fire picture-taker to his staff. Money seldom passed between us; cigars, dentifrices, shaving supplies and advertising were our legal tender. Warming up I continued to set forth how he should get the "boiler-plate" syndicate to omit the Narragansett sea-serpent tale and the story of the Winsted wire-walking chicken from the "patent" fourth page, leaving a hole wherein he could depict "Stump" Daly, the local baseball star, in the act of stealing third base; "Smoke" Baker with his record trout; the local fire-fighters in action; Sam Jackson's mule running away, or any one of the thousand daily occurrences that can be told more forcibly in a picture than by a pen—I ran pretty close to the rocks then.

We talked over all the necessary incidentals, and I wrote out an order for a \$125 outfit. Then I started to boom things photographic in my camera-bought advertising space.

I knew, because I had seen them, that many cameras had been received as Christmas presents a few months before, although few of these were in working evidence at the time of which I tell. Still I had hopes in the awakening out-of-doors—and in my publicity scheme. Having more influence upon the latter I devoted myself to its case. In the newspaper space I told of the lasting joy of recorded scenes and occasions of delight and the pleasures of home portraiture; I pointed out the ease with which pleasing and also profitable results could be secured; and I offered to give free instructions in every phase of the subject and to aid in difficulties—there were times when I had to take a case under advisement and reserve my decision while I read up on the particular phase. The combinations of these three themes are many: I used fifteen or eighteen pieces of copy. It is difficult for me to say what arguments were the most convincing, each had its quota of recruits.

Of course every cameraist who availed himself of the "help bureau" was duly impressed with the fact

that I had a supply depot for films, plates, papers and chemicals and that he might use my dark room free. Through the "help bureau" and otherwise I secured the names and addresses of a large number of photographers in every class of proficiency. Every time I saw a person with a camera I busied myself to learn from acquaintances who he was and where he lived. Literature supplied by manufacturers, sample prints and reminders of various sorts were distributed regularly through the mailing list thus compiled.

Clarke got so interested in photography through getting pictures for the *Standard* that he soon became a most enthusiastic devotee. Between us we did much to popularize picture-making by having special articles and descriptions of picturesque little trips in his paper at frequent intervals. Another means I found useful toward making photographers was to address the Y. M. C. A. and the civic league on the development of the photographic art and the chemistry of photography, performing experiments to illustrate the influence of light on silver salts and the action of developers, fixing baths, reducers, toners, etc. I also found it a good plan to take pictures of parades, store decorations, evening parties and other gatherings and to show them to participants who were invited to call at the store.

Throughout the country adjacent to town sign-boards were distributed. Some on trees along the creek proclaimed the indisputable evidence of photographs of the catch of fish. At the favorite picnicing grounds were signs telling of the added enjoyment a camera would afford and others setting forth the satisfaction to be had by using supplies purchased at my store.

Perhaps the riskiest thing I undertook was a series of photographic contests. Much tact is required in carrying on a contest, and the chances for a happy ending are not of the best. However, the series was quite satisfactory. The first contest had to do with pictures of wild animal life in its natural state, and brought forth many fine photographs. I was fortunate in securing the services as judge of the professor of natural history at the normal school in the neighboring city. Wild flowers were the subject of the second contest which was judged by the botanical and art instructors from the school. By far the most popular contest was the one in home portraiture. Editor Clarke and the art instructor had their hands full to reach a decision.

At the beginning of each contest an appropriate window display was used at the store. This showed a wax-figure boy or girl with a camera photographing a stuffed bird on a nest, a clump of daisies, or a wax figure dressed to represent grandmother, each group in a suitable setting. Displays of cameras and supplies were frequently made. One resultful trim put on early in June consisted of a heap of carefully disarranged traveling bags, rugs, hammocks, time-table folders, guide books, tennis racquets, and baseball supplies, with a woman gowned for traveling standing by with parasol and camera in a case. Due emphasis was given on a large card to the necessity of a camera toward a successful vacation.

The interest I had aroused during the summer was not permitted to lag during the cold weather, and photography in this town is now an all-year-round pastime. Not being the only dealer in photographic supplies here, I did not get all the returns from my efforts, but I am satisfied that the scheme of T. Wym-

bleton Clarke was not fruitless in my application of it. The *Standard* has no three-inch scare heads yet, but its local illustrations have caught the public fancy and adorn the scrap-books of many new subscribers.

Woes of a New Proprietor.*

BY A CONFIDENTIAL FRIEND.

George had not been owner of the drug store a week before he discovered several things. One was that he had to be at the store more hours than when he was clerking, and this was a sort of surprise to him. The two clerks of the store had their regular time arranged all right, just when they were to come and go, according to the system introduced by the former proprietor of the store. It was not many days before George became aware of the fact that he was putting in more time than either of the clerks. The three had regular shifts, arranged so that two of them would be at the store all the time. George proceeded to even up matters so that each would have equal time to serve, and trouble began at once. Therefore he decided to let the time schedule remain as it had been, at least until he became better acquainted with the management of the store and independent enough to discharge and hire help.

Another little surprise in store for him was the fact that the two clerks were in the habit of smoking quite a number of cigars "on the house" every day. He also saw that the two clerks were accustomed to be free with his chewing gum, soda water, ice cream and candy. He saw the clerks give little lots of this stuff to girl friends. His clerks told him that this was one way they held the business of the grown folks. To George it looked like destroying the profits on a considerable proportion of the day's sales to be so liberal with his stock. He received another shock one day when he went to the cash drawer to get money to pay a bill, and found that several dollars were gone and in their place was a sort of "I O U" paper signed by one of the clerks. The clerk explained that he was paying his wages a few days in advance, as he needed the money. He said that the other "boss" never objected. George listened to the talk of a drummer who sold cash registers who happened along soon after, and had a cash registering machine installed in his store, much to the disgust of the clerks who at first made all kinds of fun and comments on the new-fangled thing. But the clerks used the cash register, and from that time on the receipts appeared to be a little better.

George put a stop to the illegitimate sales of liquor which had been a part of the trade of the store, and by doing so lost some profitable customers. From the very beginning of his administration he seemed to do the very things that made him lose good patrons, and new customers were scarce.

Near George's store there were a number of workmen's families and these families often sent their children to the store to get ice cream. Invariably the children brought utensils that would hold a full quart of ice cream and often more, and the mothers would provide the children with the price for one pint of

cream (or less) and the child would ask for that amount, taking it for granted that George would be liberal and fill the pitcher or dish, regardless of the capacity of the same. As George was accustomed to giving pints for pints and not quarts for pints, he offended many a child and mother, unconsciously, and lost some good business before his clerks told him that he must be prepared to lose money in the local pitcher trade for cream, in order to retain the custom of the people for goods on which there was a profit. But in the meantime the children had transferred their trade to the confectionery store down the block.

As weeks passed George learned more and more. His store was on a corner where accidents were frequent, due to the recklessness of automobile drivers and a grade which got slippery in wet weather. Then the cars hurt someone at that corner every now and then; and during the night hours the roughs of the vicinity had squabbles near by. Consequently George rendered a good deal of "first aid to the injured." In cases in which the subject had been injured by the street railway, he had only to send the bill for plaster and other articles to the car company, and receive his pay in due time. A few of the automobilists also paid well for the care of those whom they injured. But the victims of the fighting gangs who were carried bodily into his store for treatment always acted as if someone else were responsible for the supplies used. Often a fictitious name and address were given by the person who had been patched up. George claimed that he really lost money in this way on the care of the injured, but said that he did not see how he could refuse to aid anyone who was suffering. Some people were really generous. One woman who got hurt near by, gave the clerks a dollar each, and impressed upon them that the money was for them, and not for George, although he had furnished the medicine used and was the man who paid the rent of the store. The two clerks thought this was a fine joke on George, and all three laughed it off, but George wondered where he came in on the deal. So George made up his mind to play the part of the clerk next time. He did so. A prosperous appearing man had a fit near the store. George devoted his best attention to him. When it was all over and George had brushed the man's clothes and smoothed his tall hat, the stranger gave him ten cents and walked out. Next day, however, he stopped and asked for the proprietor, so as to get his bill for the treatment he had received. He thought it a good joke when George proved to be the man, and in the merriment went away without making any further payment.

In fact, the jokes all seemed to be on George. It was a great laughing game until the end of the month, when he took stock. Then he found that his net loss for the month was just \$40. But he was not discouraged. He determined to fight it out.

Methylene Blue as an Indicator.

Sinnat (*Analyst*.) finds that when methylene blue is added to dilute solutions of iodine in potassium iodide, a yellowish-green color is produced which finally changes to a clear yellowish-brown. He proposes the blue as a substitute for starch in iodometric titrations. In strong solutions a precipitate of an iodo-compound of the methylene blue is obtained, but in the dilute form as an indicator the color changes are as described.

*In the *CIRCULAR* for April, page 184, a friend of George's tells how George bought a drug store from a sharp fellow who "gold-bricked" him very neatly. The friend said in concluding his story that George had lots of other harrowing experiences which were worth relating. Some of them are told in this article.—Editor THE DRUGGISTS CIRCULAR.

Efficient Medicaments in Palatable Form.*

By JACOB DINER.

Prof. A. B. Lyons, a member of the U. S. P. revision committee, has justly said that physicians themselves should be the ones to select the combinations they desire to prescribe, as they did in the beginning in constructing the Pharmacopœia. Not so many years ago the patient was satisfied with the medication given by the physician when such medication accomplished its primary object, that of curing or alleviating the disease. Pleasant taste and elegant appearance of the medicine played no part; in fact popular opinion had it that the more disagreeable the medicine tasted the greater was its efficiency. And quantity was by no means a matter of secondary consideration; the one pound mixture of herbs to be infused or decocted by the patient, the pint of medicine to be taken in wineglassful doses, the teaspoonful or tablespoonful of powder to be taken dry on the tongue, still linger in the memory of we pharmacists who have dispensed them; and the taste of the medicines probably still sends stimuli over the gustatory or olfactory nerves of the "patient" sufferer who had to take them. Zittelmann's decoction in lots of twelve or more 16-ounce bottles dispensed at one time is not such a thing of the past as to be entirely forgotten by many present here to-night.

Advances in chemistry, pharmacy and pharmacognosy have given us the active principles, and along with development in other lines—or should we say with Dr. Walsh: Along with the return to ancient accomplishments and perfection—public taste has undergone a change. With the bath-tub, the telephone, electricity and the many other advantages of modern times the demands of the public have risen gradually and yesterday's luxuries have become to-day's necessities.

It was only natural then that the taste, literally, in medicine should change; and the chemist stood ready to supply the demand. The ever-busy physician could hardly be expected to devote his time to experiments with a view to improving the taste of his remedies, but, recognizing the demand, and the justice of the demand, of the patient for more palatable remedies, he readily accepted the suggestions of the chemist and modified his prescriptions accordingly. Pretty soon the chemist realized the commercial possibilities of palatable medication and used the affable and accommodating "busy practitioner" for the exploitation of his remedies by getting him to prescribe them in original containers—and we have the arrival of our modern proprietary medicine.

In the meantime the physician had become so accustomed to letting the chemist do his taste-correcting for him that he finally let his thinking and prescribing be done for him in the same wholesale manner, believing himself still too busy to think for himself. The result is not only a market flooded with proprietary and semi-proprietary medicines, but, still more serious, an era of self-medication which threatens to make the busy practitioner a thing of the past.

Now it is true that it is not always easy for the physician to present his remedies in palatable form, and the bogey of incompatibility so deters him that

he is afraid to combine two remedial agents lest he run a-foul of incompatibles. Yet the mastering of a few fundamental principles of incompatibility, and familiarity with a few standard adjuvants and vehicles will enable almost any physician to prescribe active and at the same time compatible and palatable remedies. It is not within the scope of my paper to enter upon the subject of incompatibles, so I will restrict myself to palatability only, mentioning a few of the most-generally used drugs and chemicals and a few general methods of their palatable presentation.

Perhaps one of the most frequently used remedial agents is quinine. Children will take this drug quite readily in sweetened or even unsweetened milk. Should another method be desired it may be given in aromatic syrup of yerba santa or in chocolate syrup. Some physicians prefer to give quinine in solution. These may overcome the bitterness of such solutions in the following manner: Prescribe the required amount of quinine sulphate dissolved in diluted sulphuric acid so that five drops represent the desired dose. Call this mixture No. 1. And order a few ounces of compound syrup of glycyrrhiza as mixture No. 2, directing the parent or attendant to put five drops of mixture No. 1 into a teaspoonful of No. 2 immediately before giving. Thus the acid has not time to precipitate the glycyrrhizin and the child gets a solution of quinine in a fairly palatable form. For adults the same vehicle may be used and in addition to this we have the wafer, the hard and soft elastic capsules and freshly made tablets.

In considering palatability the bromides require particular thought. To mask the rather unpleasant taste of these salts a quantity of solution of citric acid added to any of the numerous syrups of the Pharmacopœia or National Formulary will be found very useful. Strictly fresh pineapple juice or the various soda-water syrups made from fresh fruit are pleasant vehicles for the bromides. The iodides and the mercurials (the soluble ones) are best administered in compound syrup of asarum, the small amount of ipecac present counteracting the untoward effect on the stomach. The sickening taste of the salicylates can be counteracted by dissolving them in elixir of gentian or by the addition of a small quantity of tincture of gentian to the aqueous solution.

For the palatable presentation of castor oil and cod liver oil, there is no better extemporaneous method than emulsification with acacia and disguising the taste and odor with any of the essential oils of the U. S. P. Since the therapeutic value of this class of remedies is markedly increased by their being fresh, a freshly made emulsion is of course far superior to any ready-made preparation which has stood on the shelves of the manufacturer, jobber and retailer for who knows how long before reaching the patient.

Another palatable and elegant form of medication is afforded by the effervescent salts. Almost any pharmacist is in a position to prepare them at very short notice, giving the physician his choice of medication rather than the conglomeration "discovered" by some "chemical" company of unknown standing and questionable reliability.

A number of elixirs and syrups of pleasant taste and elegant appearance are at the disposal of the prescriber and without going into detail concerning their composition I shall only state that they readily lend themselves as pleasant aids to the prescriber who has time and intelligence to think.

*Read at a meeting of the New York branch of the American Pharmaceutical Association with the Medical Society of the County of New York, and contributed by the author.

I can not close without pointing out two things of importance to the medical men: First, the proprietary medicine, put up in fancy bottles with full directions for the patient and physician, may or may not contain the active ingredients claimed in the alluring literature accompanying the bottle; more often it does not; and the formulas are changed with the fluctuation of the market or the whim of the manufacturer without the ceremony of notifying the prescriber. Your prescription compounded by a reliable pharmacist of whose standing you can inform yourself readily *does* contain what you order, and is not "subject to change without notice." Second, any pharmacist will be pleased to assist you in formulating a palatable remedy containing the active ingredients required for the individual case. It is not my intention, gentlemen, to teach you how to prescribe, nor do I consider myself capable of teaching you. I merely want to point out a few methods of palatable medication which have come to my knowledge as a practicing pharmacist. Let us not believe that one or even half a dozen meetings of this kind will revolutionize the prescribing of this country, but let us keep at it, unmindful of the indifferent and the scoffer, remembering Longfellow's words:

The heights by great men reached and kept
Were not attained by sudden flight,
But they, while their companions slept,
Were toiling upward in the night.

Petrox Preparations.

In a paper presented at the March pharmaceutical meeting of the Philadelphia College of Pharmacy G. M. Beringer and G. M. Beringer, Jr., reviewed comprehensively the use of petrolatum-oleic acid combinations as absorbable yet protective vehicles for external medication. The authors also recounted some experimentation toward the improvement of the National Formulary preparations of this class and amplification of their uses in compound medicaments for external use.

Out of this experimentation had come the appended formulas which were reported in the paper. The methods of manipulation set forth in connection with the respective formulas are those which the authors found to be essential to the success of the processes. It is quite important that the directions be followed carefully, otherwise the results will be unsatisfactory.

Solid Petrox.

Paraffin	37 grammes.
Liquid petrolatum.....	20 grammes.
Oleic acid.....	30 grammes.
Oil of lavender flowers.....	3 grammes.
Alcohol	5 grammes.
Stronger ammonia water.....	5 grammes.

Melt the paraffin with the liquid petrolatum, on a water-bath; add the oleic acid, and transfer the mixture at once to a warm mortar. Immediately add the oil of lavender flowers and the alcohol and stronger ammonia water mixed, and stir continuously until cool.

This yields a pale-yellow ointment, and, if the above directions are carefully followed, the resulting product is smooth and creamy, very suitable as an ointment base. It is essential that the mortar be warmed so as to insure a gradual cooling, and that the stirring be continuous, otherwise the mass will be uneven and granular.

Liquid Petrox.

Liquid petrolatum.....	50 grammes.
Oleic acid.....	28 grammes.
Oil of lavender flowers.....	2 grammes.
Stronger ammonia water.....	5 grammes.
Alcohol	15 grammes.

Mix the liquid petrolatum, oleic acid and oil of lavender flowers, in a flask, then add the alcohol and finally the stronger ammonia water, and agitate thoroughly until clear, warming the mixture slightly, on a water-bath if necessary. Slight warming may be required in cold weather, to promote the saponification.

A yellowish-brown liquid, soluble in ether, chloroform, benzoin, and acetone, produces an emulsion on agitation with twice its volume of water. The proportions of the ingredients in this formula do not differ very greatly from those in the present N. F. formula. The product forms a permanent emulsion with water. The formula of the British Pharmaceutical Codex yields a preparation that will not even form a good temporary emulsion with water but separates almost immediately.

Camphor and Chloroform Petrox.

Chloroform	25 grammes.
Camphor	25 grammes.
Liquid petrox	50 grammes.

Dissolve the camphor in the chloroform; then add the liquid petrox.

Cade Petrox.

Oil of cade.....	25 grammes.
Liquid petrox.....	75 grammes.

Mix them.

Creosote Petrox.

Creosote	20 grammes.
Oleic acid.....	5 grammes.
Liquid petrox.....	75 grammes.

Mix them.

The B. P. C. directs only 5 per cent. of creosote, yet calls for 20 per cent. of guaiacol in the formula with the latter medication. It was deemed advisable to make our formulas correspond with the usage of American practice. If 5 per cent. of creosote be all that is required the addition of oleic acid will not be necessary.

Eucalyptol Petrox.

Eucalyptol	20 grammes.
Liquid petrox.....	20 grammes.

Mix them.

Guaiacol Petrox.

Guaiacol	20 grammes.
Oleic acid.....	5 grammes.
Liquid petrox.....	75 grammes.

Mix them.

The creosote, guaiacol and eucalyptol petroxes all darken considerably on keeping; they can readily be prepared as wanted. The darkening is probably due to traces of iron in the oleic acid and is not serious, as it can not affect the medicinal action.

Mercury Petrox.

Mercury	30 grammes.
Hydrous wool-fat.....	15 grammes.
Solid petrox.....	55 grammes.

Triturate the mercury with the hydrous wool-fat until it is distributed and globules are no longer visible when examined with a lens magnifying ten diameters; then add the solid petrox and mix thoroughly.

The percentage of mercury has been reduced to 30 per cent., which, in a base so readily absorbed, is believed to be ample to produce salivation.

Ichthyol Petrox.

Ichthyol	10 grammes.
Oleic acid.....	5 grammes.
Liquid petrox.....	85 grammes.

Mix them.

Iodine Petrox, 10 per cent.

Iodine	10 grammes.
Oleic acid.....	40 grammes.
Alcohol	20 grammes.
Liquid petrolatum.....	23 grammes.
Oil of lavender flowers.....	2 grammes.
Stronger ammonia water.....	5 grammes.

Reduce the iodine to a coarse powder by triturating in a glass mortar and transfer it to a suitable flask; add the alcohol and then the oleic acid, and agitate the contents of the flask until the iodine is dissolved; add the oil of lavender flowers and the liquid petrolatum, and mix the liquids, and finally add the stronger water of ammonia, shaking the mixture until a clear solution results.

It was found impossible to prepare a 10 per cent. iodine preparation by simple solution in the liquid petrox. By improper mixing there results another difficulty, namely, the separation of the iodine as a salt, and this is a diffi-

culty that has not been overcome by some of the manufacturers of the proprietary preparations. The writers have examined several bottles of one manufacture that is greatly prescribed, in which appeared quite heavy crystalline sediments that proved to be ammonium iodide. A sample made by the proposed formula has now been kept for more than five months without sign of any separation of a crystalline deposit.

Iodine Petrox, 5 per cent.

Iodine petrox..... 50 grammes.
Liquid petrox..... 50 grammes.
Mix them.

Alternative formula:

Iodine, in coarse powder..... 5 grammes.
Liquid petrox..... 95 grammes.

Dissolve the iodine by agitation with the liquid petrox in a stoppered bottle.

An assay process should be provided for the iodine petroxes. The *Ergänzungsbuch zum Deutschen Arzneibuch* gives a method of assay which should, however, be thoroughly tried by a competent chemist before being adopted in the N. F.

Iodoform Petrox.

Iodoform 3 grammes.
Acetone 20 grammes.
Oleic acid 10 grammes.
Eucalyptol 3 grammes.
Liquid petrox..... 64 grammes.

Dissolve the iodoform in the acetone, add the eucalyptol, oleic acid and the liquid petrox, and mix the ingredients.

Despite the statements in the books, 3 per cent. of iodoform can not be dissolved in liquid petrox alone, even if heat be used; only a portion will dissolve and this largely crystallizes out on cooling. Consequently, one of the solvents for iodoform must be made use of and for this purpose we selected acetone. The disagreeable odor of iodoform is modified and largely overcome by the combination of eucalyptol and lavender.

Menthol Petrox.

Menthol 5 grammes.
Liquid petrox..... 95 grammes.
Dissolve the menthol in the liquid petrox by agitation.

Methyl Salicylate Petrox.

Methyl salicylate..... 20 grammes.
Liquid petrox..... 80 grammes.
Mix them.

Naphthol Petrox.

Betanaphthol 10 grammes.
Liquid petrox..... 90 grammes.

Dissolve the betanaphthol in the liquid petrox by agitation.

Phenol Petrox.

Phenol 5 grammes.
Liquid petrox..... 95 grammes.

Dissolve the phenol in the liquid petrox by agitation in a stoppered bottle.

Tar Petrox.

Oil of tar..... 25 grammes.
Liquid petrox..... 75 grammes.
Mix them.

Oil of tar makes a clear solution and for this use it is certainly to be preferred to tar; hence we have departed from the formulas of the foreign formularies which direct tar.

Salicylated Petrox.

Salicylic acid..... 10 grammes.
Oleic acid..... 5 grammes.
Liquid petrox..... 85 grammes.

Dissolve the salicylic acid in the oleic acid and liquid petrox.

Campho-Phenic Petrox.

Phenol 12.5 grammes.
Camphor, in powder..... 37.5 grammes.
Liquid petrox..... 50.0 grammes.

Mix the camphor and the phenol and when the mixture has liquefied add the liquid petrox and mix thoroughly.

Sulphur Petrox.

Sublimed sulphur..... 3 grammes.
Linseed oil..... 37 grammes.
Oleic acid..... 30 grammes.
Liquid petrox..... sufficient to make 100 grammes.

Heat the sublimed sulphur and the linseed oil in a flask, on a sand-bath, until the sulphur is dissolved; then allow to cool and add the oleic acid and sufficient liquid petrox to make the product weigh 100 grammes, warming the mixture slightly if necessary to obtain a clear liquid.

A dark-brown, thick, oleaginous liquid possessing a very foul odor. It is not liable that this will be used per se, but it can be diluted and serves for the preparation of the succeeding formula.

Compound Sulphur Petrox.

Sulphur petrox..... 10.0 grammes.
Oil of cade..... 10.0 grammes.
Thymol 0.3 gramme.
Eucalyptol 3.0 grammes.
Oil of turpentine..... 30.0 grammes.
Liquid petrox, sufficient to make..... 100.0 grammes.

Mix the thymol and the eucalyptol, add the oils and then the sulphur petrox, and finally sufficient liquid petrox to make the product weigh 100 grammes.

Venice Turpentine Petrox.

Venice turpentine..... 20 grammes.
Liquid petrox..... 80 grammes.
Mix them.

A Get-Together Recommendation as Part of the Official Preparations Propaganda.

The present depressed and unremunerative condition of pharmacy as a business does not, perhaps, fall strictly within the scope of this association. Yet, in view of the fact that one of the most prominent causes of that depression is strictly pharmaceutical, it may not be amiss to allude to it in this paper. I refer to the large and increasing demand for proprietary medicines, which filches from the pharmacist so large a portion of his legitimate profits. Many of these preparations, it is true, reach the consumer through the pharmacist; yet, when we look around upon our shelves at the multiplicity of these medicines we are compelled to carry in stock to meet business demands, and of which many are practically unsalable—the question of profit in handling the class of preparations referred to becomes a problem difficult to figure out. At the Hagerstown meeting of the Maryland State Pharmaceutical Association, some preambles and a resolution were passed, worded thus:

Whereas, The rapid multiplication of that class of remedies known under the general head of proprietary medicines works serious evils to legitimate pharmacy; and

Whereas, The elegant dilutions presented to the public in the shape of elixirs and many other popular forms are very costly to the consumers, and frequently of doubtful value; and

Whereas, The Pharmacopoeia furnishes ample choice of remedies to enable the physician to combat disease;

Therefore, Be it Resolved, That the Maryland State Pharmaceutical Association most earnestly request its members to use their best efforts to induce physicians, when prescribing, to give preference to official remedies.

This resolution is a step in the right direction, but possibly does not go far enough. It is by the aid and countenance of physicians that this evil can be controlled and lessened. Physicians, if properly approached, will ever be found ready to aid and foster with their best efforts all measures in the interest of pharmacy that will inure to public good. If the intent of the resolution, amplified and endorsed by this association, and possibly supplemented by the conjoint action of the various State pharmaceutical associations invoked by the direct appeal of this association, were put into proper shape and brought to the attention of physicians by direct communication officially with the many medical associations throughout our land, I believe it would go far to correct the evil. The resolution should recognize the fact that the many preparations now in popular use that may be grouped under the head of so-called "elegant pharmacy," have become such fixtures in our business that it will not do to ignore them, and embrace in its request that physicians confine their prescriptions to official, and such non-secret, non-proprietary remedies as may be endorsed by, and the formula published from time to time under the sanction of this association.

The foregoing reads as if it might be a portion of a paper presented at a recent get-together meeting of physicians and pharmacists, but it isn't; it is an extract from the presidential address of Joseph Roberts, delivered before the American Pharmaceutical Association in 1886—just twenty-five years ago.

A Lubricating Oil as a Carrier of Infection.

Huffman reports (*N. Y. Med. Journ.*) an epidemic of a skin disease, impetigo contagiosa, occurring in a machine shop, the carrier being a lubricating oil. As long as the patients were treated by their several physicians a variety of diagnoses were made without the cause of the disease being discovered. Eventually quite a number of machinists working in the same department complained that the lubricating oil they were using caused a rash where it came in contact with the skin. The oil was examined chemically without result; organic impurities were not looked for as from having been heated in making (from lard) it was supposed to be sterile. The men complaining were ordered to report for examination and treatment. Quite a number had complained, but only six reported. Of these, five presented inflamed papules and pustules distributed irregularly over the upper extremities, face and neck, wherever the oil might reach the exposed skin. The sixth man did not have a rash, but said that he had had a "felon" on his thumb which was entirely healed. Upon questioning him, he stated that he had worked at a screw machine supplied by the same oil pump as that which supplied oil to the machines and lathes of the other five men; that he had worked in the oil while the abscess on his thumb was discharging pus; that this occurred just before the rash appeared upon his fellow workmen; that he had not had any rash but thought perhaps that his abscess might have been due to the oil. This verbal evidence needed only to be supplemented with knowledge of the lubricating system of these six machines to point clearly to the fact that the pyogenic germs discharged into the oil from the abscess on the finger of this man had been the cause of the pustular rash on the other five. At the factory it was found that the waste oil of the six machines at which these men had worked drained to a common reservoir from which after being strained it was again pumped to the same six machines—thus making successive cycles. The identical oil which had been at one time in contact with the abscess had been mixed with all the oil in the reservoir and thus diluted had been splashed upon the arms and faces of the machinists. The oil was destroyed and no new cases developed.

An Overlooked Supply of Rubber.

The *India Rubber World* in discussing the position of the rubber market remarks: "There is, however, another source of supply that crude rubber men are likely to overlook, yet one that will wonderfully help in case of a short crop or too high a range of prices on the Amazon. The world, not the tropical world, but the temperate zone, possesses several million pounds of Para rubber that will be shortly offered to the trade at from 50 to 70 cents a pound. There will be a steady offering of it for years to come and the supply will increase. Its source is the worn-out motor tire that goes to the reclaimer and is thoroughly 'recovered.' For five years past the tire manufacturers have been turning out tons of tires and paying a high price for raw material. This great accumulation of rubber is just beginning to come back, and is of a grade that can be used in almost any line of work."

If we do not purge pharmacy of its law violators, we have no right to kick when we are given undesirable publicity by their acts.—*Pacific Drug Review*.

Some New Canadian Preparations.

The following are some of the additions to the Canadian Formulary:

Syrup of Wild Cherry with Cod Liver Oil and Malt Extract.

Cod liver oil.....	250.0 c.c. (mils).
Extract of malt.....	250.0 c.c. (mils).
Glycerin	50.0 c.c. (mils).
Powdered acacia.....	50.0 grammes.
Oil of peppermint.....	1.5 c.c. (mils).
Syrup of wild cherry, sufficient to make.....	1,000.0 c.c. (mils).

Triturate the oils with the powdered acacia until homogeneous; add all at once 300 c.c. (mils) of syrup of wild cherry and triturate until an emulsion is formed. To this add gradually with constant stirring a mixture of the extract of malt, the glycerin and 125 c.c. (mils) of syrup of wild cherry. Finally add the required amount of syrup.

Compound Capsicum Ointment.

Oleoresin of capsicum.....	16 c.c. (mils).
Croton oil.....	8 c.c. (mils).
Powdered camphor.....	16 grammes.
Oil of turpentine.....	32 c.c. (mils).
Oil of cajuput.....	16 c.c. (mils).
Oil of cloves.....	8 c.c. (mils).
Methyl salicylate.....	8 c.c. (mils).
Yellow wax.....	32 grammes.
Yellow petrolatum.....	500 grammes.

Liquefy the wax and the petrolatum on a water-bath; dissolve the camphor and the oleoresin in the essential oils; mix everything together; strain through muslin, and stir until congealed.

Compound Ointment of Zinc Carbonate.

Zinc carbonate.....	45.0 grammes.
Salicylic acid.....	5.6 grammes.
Hydrous wool-fat.....	45.0 grammes.
Petrolatum	125.0 grammes.
Benzoated lard sufficient to make	250.0 grammes.

Liquefy the petrolatum on a water-bath; dust into the liquid the zinc carbonate and the salicylic acid previously well powdered; mix thoroughly; add the other fats, and stir until cold.

Crystal Brilliantine.

Natural palmitin.....	500 grammes.
Russian paraffin oil.....	3,000 grammes.
Saturated alcoholic solution of sodium hydroxide.....	enough.
Vanillin	7 grammes.
Coumarin	7 grammes.
Artificial musk.....	3 grammes.
Oil of sweet orange.....	25 c.c. (mils).
Oil of neroli.....	1 c.c. (mil).
Benzyl acetate.....	3 c.c. (mils).
Benzyl alcohol.....	3 c.c. (mils).
Fat-soluble chlorophyll.....	enough.

Dissolve 400 grammes of the palmitin in 1,000 grammes of the oil with the aid of heat; saponify with the solution of sodium hydroxide until the batch is alkaline to phenolphthalein. Dissolve this soap in a solution of the rest of the palmitin in the remaining 2,000 grammes of oil, using a temperature of 110° C. As the mass begins to cool stir in the color and the perfumes previously mixed, and pour into suitable containers.

Abstracts

Estimation of Nitric Acid in Commercial Bismuth Subnitrate.

The method of estimating nitric acid in commercial bismuth subnitrate originated by Smith has been modified by Harrison (*Ann. chem. analyt.*) in the following way: A mixture of 2 grammes of bismuth subnitrate, 20 c.c. (mils) of water and 10 c.c. (mils) of normal caustic soda solution are heated with frequent stirring until the bismuth oxide has assumed a uniform yellow color, indicating that the decomposition of the subnitrate is complete. The liquid is then separated by decantation, the precipitate thrown on a filter and washed two or three times with hot water. After cooling the combined liquid and wash-waters are diluted with sufficient water to measure 100 c.c. (mils); 25 c.c. (mils) of this solution are then neutralized with normal sulphuric acid and after the addition of 0.5 c.c. (mil) of acid of the same strength evaporated to 2 to 3 c.c. (mils). This residue is then transferred to a nitrometer and the nitrogen present in it is determined in the usual way. The author also calls attention to a method originated by Brown, the details of which were published just when the experiments above described had been finished. This method depends on the conversion of bismuth subnitrate into bismuth oxychloride and nitric acid by means of sodium chloride. The bismuth oxychloride is separated from the mixture by filtration and in the filtrate the nitric acid is determined by titrating in an aliquot part the excess of sodium chloride, not used for the conversion of bismuth subnitrate, with N/10 silver nitrate solution; and by evaporating another aliquot part to dryness in the presence of an excess of hydrochloric acid and estimating the combined sodium chloride, both that obtained by the decomposition of the sodium nitrate with the hydrochloric acid and that not used for converting the bismuth subnitrate. From the figures thus obtained the amount of nitric acid can easily be calculated.

Improvement in Heller's Test for Albumin.

Heller's test for albumin in urine or other liquid, which consists in gently running a layer of the liquid on to the surface of nitric acid and noticing if a white ring is formed where the two liquids meet, is somewhat reduced in value by the difficulty in preventing the liquids mixing; if mixing occurs, the albumin is not precipitated on diluting. Michel (*Chem. Zeit.* through *Pharm. Journ.*) in experiments to obviate this difficulty by raising the specific gravity of the acid by dissolving certain salts in it finds that the test is much improved by saturating the nitric acid (specific gravity 1.4) with ammonium nitrate. About 2 c.c. (mils) of the reagent is then taken, and 1 c.c. (mil) of the liquid to be tested is gently run on to its surface by means of a pipette; a well-defined white ring forms at once or after some time, according to the amount of albumin present. If carefully shaken, the two liquids only mix slowly, and if albumin is present, the upper liquid becomes more or less cloudy, unlike what happens with ordinary nitric acid. If the mixture is heated it becomes clear, with the development of a slight yellow color; on cooling the turbidity reappears, and is much increased on diluting.

Separation of Urobilin by Talcum.

Carrez (*Rép. pharm.*) notes that when urine is clarified with the aid of ferrocyanide of zinc, a reddish precipitate at times is obtained. This color indicates the presence of urobilin. In the urine of diabetic persons, however, the reddish color often can hardly be noticed and the urobilin can be detected only by applying Oliviero's reagent which is prepared by dissolving 10 grammes of zinc chloride in about 30 grammes of ammonia water—or sufficient to redissolve the precipitate first formed—and mixing the solution with 80 grammes of alcohol and 20 grammes of acetic ether. By treating the precipitate with this reagent and filtering, a filtrate will be obtained which in the presence of urobilin shows a characteristic green fluorescence. The author recommends the following modification of this process: forty-five c.c. (mils) of the urine to be examined are mixed thoroughly with 30 c.c. (mils) of Denigès' reagent (solution of acid mercury sulphate) and filtered; 50 c.c. (mils) of the clear filtrate are shaken with 1 gramme of talcum, which absorbs the urobilin, the mixture filtered at once, and the talcum washed well with distilled water. The urobilin cannot be removed from the talcum by washing with water or alcohol, but can easily be dissolved by ammoniacal alcohol or by alcohol containing hydrochloric acid. For the identification of urobilin the talcum enclosing the urobilin is treated on the filter with 5 to 6 c.c. (mils) of Oliviero's reagent, when at once a filtrate possessing a beautiful green fluorescence will be obtained, which, when viewed through a spectroscope, shows the characteristic band.

Action of Artificial Membranes on Ferments.

Porter (*Quart. Journ. Exp. Physiol.*) finds that a number of ferments, including pepsin, trypsin, and rennin, are rendered inactive by being kept in contact with artificial membranes, especially with colloidal ones. Most ferments which have thus been inactivated have at the same time acquired inhibitive properties. The inactivation of ferments by membranes is not due to simple absorption, for there is no evidence of saturation of the membrane; on the contrary, its inactivating power appears to improve with repeated use. Although the inhibitive power of the inactivated ferments may be due in part to substances preformed in the solution, inhibition is still present after removal of these substances, suggesting that the ferment itself is changed by contact with a membrane into a substance having an inhibiting power on itself.

How to Observe in Making Albumin Tests.

Katzenstein (*Journ. Am. Med. Asso.*) recommends that in making the heat or the contact tests for albumin, one should pass light rays through the urine and observe it at right angles to the rays—the principle being the same as seeing particles of dust in a ray of sunshine. Very minute quantities of albumin can thus be detected, says the author. In specimens in which he and others had failed to detect cloudiness in all other lights it was easily seen by this method. The urine should always be filtered, especially with the contact test. Any bull's-eye lantern will suffice for the method, and it has the advantage of being usable at any time, night or day.

Cancer in Tar Workers.

Schamberg in a paper presented at a meeting of the American Dermatological Association, said that cancers of the skin had been encountered in chimney-sweeps and in tar and paraffin workers. He reported in detail a case of multiple cancer of the skin which had occurred in a tar worker. That something present in coal tar, crude paraffin, and soot was capable, after the lapse of years, of stimulating the growth of epithelial cells and of leading to cancer in certain subjects seemed to him indisputable. As radium had proved capable of stimulating epithelial proliferation and cancer could be produced by the x-rays, it occurred to the author to determine whether coal tar emitted any rays. To test this he placed a copper cent, a flat key, and a small brass numeral upon a photographic plate in a pasteboard negative box lined with black paper. To the under surface of the lid he attached a piece of cardboard smeared with coal tar so that the tar faced downward. This box was enclosed in a black japanned tin cash box and the latter was shut in a dark closet for twenty-four hours. When the plate was developed a distinct shadowgraph of the three objects was seen upon the negative. This work was done so recently that there had not been time to carry out further investigations. If coal tar was proven to be radioactive it would seem that this radioactivity might be responsible for the cancer in tar workers. Volkmann and other writers long ago noted that uncleanness, i. e., negligence in removing tar or paraffin from the skin, was a factor in the production of the cancer. Only certain kinds of coal seemed to be provocative of the cutaneous changes. In Germany the so-called brown or cannel coal from which paraffin was made was responsible. Chimney-sweep cancer appeared to result almost exclusively from the burning of "pit coal" used for fuel in England. It was possible that certain coal might contain radioactive substances and that in other coal such substances might be absent. In a discussion which followed, Pusey said that even if it were positively demonstrated that tar had a moderate degree of radioactivity, he would not be inclined to attach much importance to it in this connection. Radioactivity was simply one form of irritation that stimulated the processes that culminated in epithelioma. In estimating the factors that contributed to the production of epithelioma there was no reason to attach more importance to radioactivity than to other forms of irritation.

Estimation of Lead in Beer.

In a paper read before the Midland (England) section of the Society of Chemical Industry, Knapp (*Pharm. Journ.*) said that while certain ingredients (glucose, invert sugar, and tartaric acid) used in the manufacture of beer may contain lead, the possible source of this impurity which led to the investigation he was reporting was the lead service pipe. Carbon dioxide may cause the solution of the lead, and the risk is increased by the acidity of the beer. Other liquids served from lead pipes have been shown on occasion to contain injurious quantities of lead. Thus, cases are recorded of ginger-beer containing 1/54 grain per gallon, and of aerated water from a soda-water fountain containing 7 grains per gallon. The quantitative estimation of these small proportions of lead can be done only by a colorimetric method,

hence it is necessary first to obtain a colorless or almost colorless solution. Several attempts were made to accomplish this, and the following process finally adopted. It is a modification of Allen's process for estimating heavy metals in canned foods: 100 c.c. (mils) of beer are evaporated to about 20 c.c. (mils) in a porcelain dish, which is as large as will conveniently go into a muffle; 10 c.c. (mils) of nitric acid are carefully added, and the evaporation continued until there is about 4 c.c. (mils) of a viscous liquid. One gramme of magnesia is well mixed with this syrup, and the whole dried and ignited in an open muffle till the ash is white. The ash is dissolved in 15 c.c. (mils) of diluted nitric acid (roughly three times normal strength), neutralized with diluted ammonium hydrate, made acid with 10 c.c. (mils) of roughly normal acetic acid, and diluted to 100 c.c. (mils). The small amount of insoluble matter is allowed to settle, and 50 c.c. (mils) of this solution in a Nessler glass is treated with 3 c.c. (mils) of saturated sulphuretted hydrogen water, and compared with standards put on at the same time. In a table showing grains of lead per gallon discovered, giving the mean of two determinations, the figures were as follows: Ale in pipe seven hours contained 0.05 grain; home-brewed ale in pipe eight hours, 0.04 grain; and mild ale in pipe seven hours, 0.03 grain.

Simple Method of Determining Phenol.

Lehmann (*Apoth. Zeit.* through *Pharm. Journ.*) notes that the gravimetric determination of phenol by precipitation as tri-bromphenol was at one time in vogue and was adopted in the second German Pharmacopœia; but it proved to be unsatisfactory, and was omitted from the third. The source of error was shown by Beckurts to be the formation of tribromphenol bromide, and this has led to a satisfactory modification of the test coming into use, and the new form of it has been adopted in the fifth German Pharmacopœia. The process consists in adding to a solution containing phenol known quantities of solutions of potassium bromide and bromate, acidifying with sulphuric acid, and shaking in a stoppered flask; after fifteen minutes' standing the excess of bromine is determined by adding potassium iodide and titrating with thiosulphate. If the bromate solution is made to contain 1.6702 grammes of KBrO_3 in 1 liter, 50 c.c. (mils) = 30 c.c. (mils) of N/10 thiosulphate; if therefore 50 c.c. (mils) of the bromate solution is employed in a given case, the number of c.c. (mils) of thiosulphate used is to be deducted from 30, and the difference multiplied by 0.001567 gives the weight of phenol precipitated. The quantity of bromide employed does not affect the result, so long as sufficient is used; from 0.5 to 1 gramme is a convenient quantity.

New Test for Thallium.

Tanatar and Petroff (*Journ. Russ. Phys. Chem. Soc.* through *School Mines Quart.*) propose sodium cobaltinitrite, $\text{Na}_3\text{Co}(\text{NO}_2)_6$, as a test for thallium. When added to a cold, slightly acid solution of a salt of that metal, $\text{Th}_3\text{Co}(\text{NO}_2)_6$ is precipitated, the precipitate being red, crystalline, and insoluble in hot water or cold dilute acids. Lead is the only other metal giving a precipitate with the reagent, and the lead compound is soluble in hot water.

Separation and Determination of Zinc.

Pipereaut and Vila (*Proc. Seventh Int. Cong. Appl. Chem.*, 1909, through *Journ. Soc. Chem. Ind.*) propose the following method for the separation and determination of zinc. Digest 5 grammes of the final powdered sample with nitrohydrochloric acid until completely disintegrated. After removal of the insoluble residue by filtration, precipitate the heavy metals and collect the acid filtrate and washings from these, in a graduated flask of 250 c.c. capacity. Neutralize the liquid with caustic soda, the addition of which is to be continued until the zinc has been precipitated and redissolved. The flask is then to be filled to the mark with water and shaken, and the contents filtered on a cone of asbestos to remove hydroxide of iron and other insoluble matter. Dilute 50 c.c. (mils) of the clear filtrate largely with distilled water and heat to boiling in a 500 c.c. (mil) conical flask, and to the boiling liquid add 2 to 3 grammes of finely powdered sulphur. The heating is continued, and after a time sulphide of zinc separates as a dense precipitate. When all the sulphur has dissolved, fill the flask to about three-quarters with boiling distilled water, and allow to stand for about fifteen minutes. The upper liquid is then to be poured off, and the precipitate washed with hot water by decantation and afterwards thrown on the filter. Finish washing by allowing about 300 to 500 c.c. (mils) of a boiling, strong solution of ammonium sulphide to flow over the precipitate. Dry the filter and precipitate, and then ignite in a muffle, the atmosphere of which should be as strongly oxidizing as possible. After 30 to 40 minutes, oxidation should be complete. The zinc oxide, after weighing, should be tested to make sure that it contains no sulphide, sulphate or substances insoluble in hydrochloric acid.

Saccharin an Adulterant.

The referee board appointed to review certain decisions of the bureau of chemistry of the United States department of agriculture recently concluded an investigation regarding the use of saccharin in food and reported that "the continued use of saccharin for a long time in quantities over three-tenths of a gram per day is liable to impair digestion; and the addition of saccharin as a substitute for cane sugar or other forms of sugar reduces the food value of the sweetened product and hence lowers its quality." On these findings, the department has issued an order that after July 1st, 1911, saccharin-containing foods will be regarded as adulterated within the meaning of the food and drugs act. An appeal from this decision by manufacturers of saccharin has, however, reopened the case.

Detection of Benzoic Acid in Butter.

Marchadier (*Ann. Falsif.* through *Pharm. Journ.*) proposes the following method for the detection of benzoic acid in butter: Into an Erlenmeyer flask containing 20 c.c. (mils) of distilled water introduce 25 grammes of the sample, a pinch of powdered pumice stone, and 0.5 c.c. (mil) of sulphuric acid. Attach the flask to a condenser suitable for the distillation of fatty acids, and heat. Collect the first 15 c.c. (mils) of distillate and add to it (1) one drop of 1 per cent. solution of ferric chloride; (2) two drops of 12-volume hydrogen dioxide diluted to 10 per cent. Shake, allow to rest. In three to six hours, if benzoic

acid be present, a very distinct violet coloration results which persists for several hours. The method is not specific for benzoic acid; all phenol bodies give the same reaction, but pure butter gives no reaction. The method is rapidly carried out (fifteen minutes at the most), and will be useful on that account, since the isolation of antiseptic substances is sometimes neglected because of the difficulties to be encountered. Experiments with margarin containing 1 to 4 grammes of benzoic acid per kilogram have always given the author positive results.

Assay of Commercial Lactic Acid.

Elvove (*Am. Journ. Pharm.*) notes that it has been pointed out by Murray that the assay requirements of the U. S. P., 1900, for lactic acid, indicating a supposed strength of 75 per cent., do not agree, theoretically, with the specific gravity therein given—"about 1.206 at 25° C." Acid of this density would have a lactic acid content of 85 to 88 per cent. This points to a defect in the method of titration. The author has found that the official process of titration during boiling to a faint pink color with phenolphthalein gives results markedly too low. A more accurate and convenient process is the following method of cold titration: About 2 grammes of the acid, accurately weighed, are treated with 50 c.c. (mils) of N/NaOH solution, well mixed, and set aside for thirty minutes. The excess of alkali is then titrated back in the usual manner, in the cold, with N/H₂SO₄ and phenolphthalein indicator. Each c.c. (mil) of N/NaOH thus used is equivalent to 0.09 gramme of lactic acid. Seven commercial samples thus tested gave from 86.1 to 89.92 per cent.; the same samples titrated directly at normal temperatures gave only 71.95 to 72.71 per cent.; other methods of manipulation gave slightly higher results. By boiling the acid with excess of alkali, cooling, and titrating back, in some instances results indential with the above cold titration were obtained, and in others only a few tenths per cent. higher.

The Rotation of Levulose.

Wender (*Biochem. Zeit.* through *Pharm. Journ.*) says that most inorganic acids bring about a rise in the specific rotation of levulose, which increases with the strength of the acid. Among the organic acids used by the author, oxalic acid causes an increase, while in presence of acetic acid a small decrease in rotation takes place. Alkalies cause a fall in the specific rotation which increases with the time, and is due to isomeric change of the sugar. Feebly basic substances are almost without effect on the rotation. Inorganic salts in some cases cause a rise, while in other cases a fall in rotation is observed. Here also the concentration of the inactive substance is of importance. Alcohols and acetone bring about a decrease in rotation which is proportional to the amount of alcohol or acetone present.

Danger in Old Colloidal Silver.

According to Hamburger (*Pharm. Week.* through *Chemical Abstracts.*) fresh collargol preparations are readily miscible with water but when two or three months old they are not so soluble. Such old solutions used intravenously sometimes produce dangerous embolisms and should therefore be avoided.

Crystallization in Sodium Salicylate Solutions.

Hill, in a letter to the *Pharmaceutical Journal*, says that since showing some months ago at a meeting of the Pharmaceutical Society of Great Britain, the formation of an abundance of hydrated crystals from a cold concentrated solution of ordinary commercial sodium salicylate, the formation of the hydrated crystals has been confirmed in several directions, and he has had a large number of cases brought to his notice by pharmacists. "There is no doubt," he continues, "that whereas formerly the crystallization of 50 per cent. solutions was a rarity, it has since become a common occurrence in winter months, and one naturally seeks for an explanation of this altered state of affairs. Speaking generally, the degree of purity of the anhydrous sodium salicylate as turned out by the best German factories to-day is very high; and, speaking particularly, the purity both of the crystallized sodium salicylate described, as well as that of the parent salt utilized, has been proved by actual tests. Clearly, then, the formation of these crystals is a perfectly normal phenomenon, and it is the former stability of the concentrated solutions which requires explanation. I incline to the view that these concentrated solutions (such as 50 per cent.) must be regarded as supersaturated solutions of the hydrated salt, and their non-crystallization attributable to the presence of impurity in the commercial salt which inhibited crystallization (the impurity being disodium salicylate $C_6H_4(ONa)COONa$, the presence of which would not affect melting-point determinations of the liberated salicylic acid). The sodium salicylate of commerce being now purer than formerly crystallizes more readily, and pharmacists must be prepared for solutions to crystallize if they fail to keep within the solubility limit of the hydrate." Watson, a fellow chemist, has determined that at 15° C. 68 grammes of anhydrous salt are soluble in 100 grammes of water; at 20° C. 100 grammes are soluble in the same quantity of water. The author urges that in making concentrated solutions of the salt, they should be prepared with hot water and filtered (through paper) to ensure the absence of any undissolved particles which may facilitate crystallization.

Action of Air on Chlorinated Lime.

Jules Garcon (*Bull. Soc. d'Encom. through Journ. Franklin Inst.*) says that when air deprived of all carbon dioxide reacts with chlorinated lime, a little hypochlorous acid is slowly liberated. (When carbon dioxide reacts with it, either in powder or dissolved, chlorine only is given off.) Ordinary damp air acting on the powder, liberates at first a mixture of hypochlorous acid and of chlorine, then chlorine only. It has the same effect on the solution. Air, freed from carbon dioxide, sets free considerable quantities of chlorine from a solution of chlorinated lime, containing no free lime.

Poisoning from Bismuth Subnitrate Paste.

At a recent meeting of the Academy of Medicine of Cincinnati Whitacre reported two cases of poisoning by injection of bismuth subnitrate paste; one proving fatal. Cushny, remarks the author, gives as the symptoms of poisoning from bismuth, salivation,

swelling of the gums, tongue and throat, and gangrene of the soft palate and other parts of the mucous membrane of the mouth. Vomiting, diarrhea, albuminuria follow. These symptoms, he continues, follow the application of much less amounts of bismuth to granulating surfaces than are frequently given internally. It would appear, says the author, that bismuth is either more rapidly absorbed from granulating surfaces than from mucous membranes, or that bismuth taken internally is prevented by the liver from reaching the general circulation.

Estimation of Creosotal and Duotal.

Fernan (*Zeit. Allg. Oester, Apoth. Ver.*) gives the following method for a rapid estimation of the purity of creosotal and duotal. Ten grammes of the substance under examination are dissolved in a porcelain dish in 30 grammes of a 10 per cent. alcoholic solution of caustic potash and the mixture evaporated with constant stirring to about 15 c.c. (mils). After adding sufficient hydrochloric acid to insure an acid reaction, the mixture is transferred to a graduated cylinder, the dish rinsed well with water, and the liquid diluted with water until 60 c.c. (mils) are obtained. After the addition of about 10 grammes of sodium chloride the mixture is shaken well and allowed to stand for a short time. The phenol separates completely and can be measured. Ten grammes of duotal should yield 7.9 c.c. (mils) of guaiacol; and 10 grammes of creosotal, 8.5 c.c. (mils) of creosote.

Estimation of Fatty Acids in Soap.

Budde (*Veroefft. Milit. Sanit.*) recommends the following process for the estimation of fatty acids in soap: 25 c.c. (mils) of a neutral soap solution representing 0.5 to 0.8 gramme of soap, are boiled with 25 c.c. (mils) of copper sulphate solution (69.26 grammes of the salt in one liter). After allowing to stand for 24 hours, the mixture is filtered through a tared filter, and flask and filter are washed well with small quantities of cold water and, after drying at 103°C., weighed. By titrating the excess of copper in the filtrate, the amount of the metal combining to form the copper salts of the fatty acids is found by difference. By deducting this amount from the weight of the copper salts contained in the flask and on the filter, and adding the weight of the hydrogen equivalent of the combined copper the amount of fatty acid is obtained.

Reagent for Chromium.

For the detection of small amounts of chromium, Koenig (*Chem. Zeit.*) recommends the use of the sodium salt of dioxynaphthalindisulphonic acid. Solutions of this salt produce with very diluted solutions of chromic acid, chromates or dichromates a cherry-red or deep red-violet color, the intensity varying with the amount of chromium present. Ferric salts produce a green color and neutral uranium or tungsten salts a red color with the reagent; these colorations disappear on the addition of phosphoric acid. The solutions to be tested should be neutral or slightly acid. On account of its sensitiveness this reaction can also be used for a colorimetric determination of chromium.

Alcoholic Fermentation.

Harden (*Ann. Brass. Dist.*) has made an extensive study of the alcoholic fermentation process, and has made the following observations: The author some years ago found that the juice obtained from yeast by grinding with water can be separated by dialysis into two substances, neither of which alone produces fermentation. The dialysable substance has been called co-enzyme, while the substance remaining on the dialysate was called enzyme. The enzyme proper is activated by the co-enzyme, even when the latter has been heated to a high temperature. These two substances gradually disappear during the fermentation process, the co-enzyme more rapidly than the enzyme. The fermentation stops as soon as the co-enzyme is used up, and may be started again by a new supply of the latter. Absolutely necessary for the fermentation is the presence of phosphates. These salts, which are contained in the dialysed liquid, do not remain intact during the fermentation process, but, according to the author, form a new compound, a combination of hexose and phosphoric acid, to which the name hexose-phosphate has been given and the formula $C_6H_{10}O_4(PO_4H_2)_2$. This product, which is not precipitated by magnesia mixture, is formed only in the presence of the co-enzyme and enzyme. The author has also made a study of the dioxyacetone $CH_2OH \cdot CO \cdot CH_2OH$, which can be isolated during the fermentation process, and which he considers as an intermediate product obtained by the reduction [oxidation?] of glycerin.

Criticism of the Pepsin Assay of the French Pharmacopœia.

Postes (*Journ. pharm. chim.* through *Pharm. Journ.*) notes that in the assay process for pepsin of the French Pharmacopœia the addition of 20 drops of nitric acid to 10 c.c. (mils) of the digestion product at the ordinary temperature is directed to show whether peptonization is complete. Pepsin of satisfactory quality is required to give no marked precipitate under these conditions. The author finds that the instruction as to temperature is not sufficiently definite to insure accurate results. Three separate 10 c.c. (mils) of the same digestion liquid, when submitted to the official test at 10°, 15°, and 20° C. respectively, gave satisfactory results at 20°, the test indicated that the pepsin was passable at 15° C., and that it was not of official strength at 10°. The temperature at which the test should be made should be definitely specified.

Quinine and Euquinine.

Astruc and Courtin (*Journ. pharm. chim.* through *Pharm. Journ.*) compare the chemical properties of quinine and euquinine. Characters common to both are: Neutrality to phenolphthalein; they are basic to helianthin and litmus; precipitated in solution by the usual alkaloidal reagents; solutions with oxygenated acids are fluorescent; they give the thalleioquin reaction; are precipitated from their salts by alkali carbonates and bicarbonates; their aqueous solutions become yellow on exposure to light; they give salts by direct action of acids. Among the characters by which they differ are: Quinine gives the herepathite reaction; euquinine does not; 0.97 of hydrochloric acid neutralizes (with helianthin), one of quinine;

1.05 of hydrochloric acid neutralizes (with helianthin) 1.00 of euquinine; 0.99 of hydrochloric acid neutralizes (with rosolic acid or litmus) 1.00 of quinine; euquinine is feebly alkaline to litmus; quinine gives two series of salts, neutral and basic; euquinine gives only neutral salts.

Caution Regarding Aspirin.

Mangan (*Brit. Med. Journ.*) reports that a lady, having been advised by a friend to try aspirin for rheumatism, took one 5-grain tablet. Soon afterwards her lips began to swell, the swelling spread rapidly all over her face, and finally her tongue and throat became affected. Some time later she again took 5 grains, with the same result, if anything more pronounced. The author looks upon the case as one of idiosyncrasy to the drug, which, though rare, makes it advisable always to start treatment with a small dose. In this case, had two or three tablets been taken instead of one, it is possible that fatal edema of the glottis might have occurred. Several similar cases have been reported elsewhere.

The Alkaloids of *Sanguinaria Canadensis*.

Kozniewski (*Bull. Acad. Sci., Cracow*, through *Chem. and Drug.*) has made an examination of the alkaloids of *sanguinaria canadensis*, which were shown by Schmidt to be five in number. Considerable difficulty has been experienced in the separation of sanguinarine, chelerithrine and protopine, and the author now describes a comparatively simple method for effecting this. The alcoholic extract of the root is evaporated and the residue treated with dilute acetic acid. The acetic acid solution is cooled and treated with 40 per cent. sulphuric acid, when a crystalline precipitate is formed, which is collected after forty-eight hours and on decomposition yields pure chelerithrine. The filtrate is cooled, and rendered faintly alkaline with ammonia, and the precipitate extracted with acetic acid and treated with sulphuric acid, by which a further crop of chelerithrine is obtained. After four precipitations all the chelerithrine is thrown down, and the filtrate contains protopine, which can be isolated in a pure state as the hydrochloride. The residue from the original acetic acid solution is treated with 20 per cent. sulphuric acid, from which the alkaloid sanguinarine is obtained in a pure state. It forms a periodide, $C_{20}H_{15}O_4 \cdot NI_2 \cdot HI$, melting at 205°. Chelerithrine periodide, $C_{21}H_{17}O_4 \cdot NI_2$, melts at 225°.

Poisoning by Tincture of Iodine.

Patris (*Arch. med. et pharm. mil.*) reports on the death apparently caused by tincture of iodine, of a soldier who had been operated on for inguinal hernia. The site of the operation had been painted with tincture of iodine prepared by the process of the Codex. The following day rattling of the throat was noticed, and to relieve the patient a small quantity of tincture of iodine was painted on the chest. On the day following an erythema, extending beyond the parts treated with iodine, developed and the next day the patient died. An autopsy showed that the wound and chest were in good condition; the lungs, however, were congested, the liver and spleen extraordinarily large and the kidneys edematous. Two similar cases have been reported in Germany.

The Modern Materia Medica.

Achibromin is monobromo-isovaleryl-glucolylyurea. It is put forward as a sedative.

Achijodin is a compound similar to achibromin, the bromine being replaced by iodine. It crystallizes in the form of small plates which melt at 150° C.

Anæsthöl, as the name indicates, is an anesthetic. It contains ethyl chloride, ether and chloroform in varying proportions.

Arsen-Blutan is a solution of ferro-manganese peptonate with arsenic.

Arsen-Regenerin consists of regenerin (ovo-lecithin, iron and manganese), lithium cacodylate and arsacetin.

Benzcain is guaiacolbenzyl ester. It is used for induction of local anesthesia by means of ionization.

Casogen is the name for a milk food. It contains milk protein, glycerophosphates, and ovo-lecithin.

Digestanol is prepared from coca, cinchona, simi-rubra, condurango, rhubarb and pepsin.

Enteroseptyl is said to be the phosphate of beta-trinaphthyl. It is claimed that it is insoluble in the gastric juice, thus passing the stomach unchanged, and is split up only in the intestines.

Ergotina styptica Egger is a fluidextract of ergot which contains stypticin. It is said to stimulate the heart action like digitalis, to act as a diuretic, and to regulate the pulse.

Eucarbon tablets, put forward as a laxative and disinfectant of the intestine, contain charcoal.

Fermentine contains the protoplasm and nucleus of yeast. It is a yellowish-white mass with a faint odor of yeast. It is said to have "reducing properties" and to act as an antiseptic.

Piamuls is the name for a cod liver oil emulsion, containing ferrous iodide, sodium and calcium hypophosphites and the yolk of eggs.

Fluoram is ammonium bifluoride.

Gelonida antineuralgia is said to contain codeine phosphate, phenacetin, and acetyl salicylic acid.

Gelonida antipyretica is said to contain antipyrine and caffeine.

Gelonida stomachica is said to contain extract of belladonna, bismuth subnitrate, and calcined magnesia.

Magricin is an effervescent powder, similar in composition to the tablets made from the Marienbad spring water.

Metaferrin is an iron-albumin preparation.

Nilotan, used for the treatment of wounds, is said to consist of balsams, resins, vegetable oils, mineral oil containing tar, and tincture of iodine.

Pacocreolin is a preparation put out by the manufacturer of creolin, and intended for disinfection of "cruder sorts." It was erroneously given the name paracreolin in our April issue.

Patentex, exploited for the treatment of leucorrhea and as an antiseptic, is a fat-free ointment containing quinosol, alsol and boric acid.

Pinoxic is an aqueous extract obtained by distilling pine-needles. It contains 3 to 4 per cent. of volatile oils.

Primon contains 10 per cent. of lecithin combined with albuminoidal substances and carbohydrates.

Pulmakol is a liquor containing potassium sulphoguaiacolate and extract of orange peel.

Phospho-Vanadiol is marketed as a combination of *vanadiol* with "organic phosphorus."

Revulsol is the name for flannel saturated with a mixture of alcohol, water, tincture of capsicum, and salicylic acid. It is put forward for the treatment of rheumatism.

Salimenthol Preparations are compounds containing as their active principle salicylic acid menthol ester.

Thiorubrol consists of a mixture of a sulphuretted fixed oil and an emulsifying agent and is colored red with phloxin.

Tribrom-beta-naphthol, put forward as a disinfectant is a mixture of several isomeric tribrom-beta-naphthols, obtained by the action of bromine on beta-naphthol. It occurs as a light-red or brown crystalline mass, which is odorless and tasteless, is insoluble in water, but soluble in most of the organic solvents and in oils and saponifiable fats.

Vanadiol is said to be a solution of vanadium hypochlorite. It is said to act as an augments of hemoglobin and to increase the leucocytic count, and is suggested for use in anemia, tuberculosis and other impoverished pathogenic conditions. We are apprised by the manufacturers that the description of *vanadiol Hélois* in the second edition of *The Modern Materia Medica* does not apply.

Vanadioseptol, offered as a germicide, is described as a solution of vanadium equivalent to 1 in 1000 corrosive mercuric chloride.

Vanodiserum is *vanadiol* prepared for hypodermic administration.

Vanaform is a dusting powder and hemostatic said to contain vanadium and to liberate oxygen in contact with diseased tissue.

Volkmann's Thymol Solution contains thymol, alcohol, glycerin and water.

Milk of Almonds.

Powdered castile soap.....	3.0 grammes.
Spermaceti	3.0 grammes.
White wax.....	3.0 grammes.
Almond oil.....	56.0 grammes.
Alcohol	100.0 c.c. (mils).
Distilled water.....	100.0 c.c. (mils).
Glycerin	100.0 c.c. (mils).
Oil of bitter almond.....	1.2 c.c. (mils).
Ammonium fluoride.....	1.2 c.c. (mils).

Melt together the first four ingredients, and into this liquid, while warm, pour all at once the mixture of the other ingredients. Beat until cool.

To Waterproof Canvas.

Stretch the cloth moderately taut and flow over it the following solutions in rotation:

a.	
Gelatin	5 ounces.
Water	1 gallon.
b.	
Alum	10 ounces.
Water	1 gallon.
c.	
Rosin soap.....	4 ounces.
Water	1 gallon.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Ichthyol in Suppositories.—M. D. C., Oklahoma.—Although it has been stated by various writers that ichthyol has a tendency to render a glyco-gelatin mass insoluble, this belief has now but few adherents and the glyco-gelatin base is quite generally used for suppositories or pessaries containing ichthyol. It has been pointed out that any hardening that may be observed in these preparations is due to a loss of water and may be prevented by keeping the suppositories in tightly stoppered bottles. Suppositories that have become hard may be made soluble by soaking them for a time in water.

G. Roe writing in the *Pharmaceutical Journal* (London) reported that the glycerin suppository mass of the British Pharmacopœia formed a very satisfactory base for ichthyol suppositories or pessaries. The British official formula for the glycerin suppository mass is as follows:

Gelatin (cut small).....	14.2 grammes.
Glycerin	71.0 grammes.
Distilled water, a sufficient quantity.	

Place the gelatin in a weighed evaporating dish with sufficient distilled water to cover it; let it stand for two minutes; pour off the excess of distilled water; set aside until the gelatin is quite soft; add the glycerin; dissolve on a water-bath; evaporate until the mixture weighs 102 grammes.

Another formula which produces a somewhat firmer mass is as follows:

Gelatin	1 ounce.
Water	1 ounce.
Glycerin	3½ ounces.

Cut the gelatin into shreds; soak it in the water until softened; add the glycerin, and make a solution with the aid of a gentle heat.

To employ either of these masses in making ichthyol suppositories, place the desired weight in a porcelain capsule; melt it over a water-bath; stir in the ichthyol, and pour into wet molds.

Staining Fluids for Bacteria.—B. S., New York.—Directions for making and using the anilin stains employed in bacteriological work are given in all the leading works on bacteriology. Several of these works have been noticed in recent issues of the CIRCULAR. Any of the following books will serve your purpose: Wood's Chemical and Microscopical Diagnosis (Appletons); Hiss and Zinsser's Text-Book of Bacteriology (Appletons); and Stitt's Practical Bacteriology, Blood Work and Parasitology (Blakiston).

With reference to the stains which you mention particularly, Wood directs that the alcoholic solutions be made as follows:

Gentian violet.

Gentian violet.....	4.8 grammes.
Alcohol, 96 per cent.....	100.0 c.c. (mils).

Methylene blue.

Methylene blue.....	7 grammes.
Alcohol, 96 per cent.....	100 c.c. (mils).

The aqueous solutions contain 1.5 per cent. of gentian violet, and 6.7 per cent. of methylene blue, respectively.

Bismarck brown is generally used in the form of a moderately dilute solution in distilled water, preserved with a small lump of camphor.

Staining solutions should be kept so as to preclude as far as possible any contact with air and light. A note on this subject appeared in last month's CIRCULAR, page 248.

Seeking a Coloring Agent.—Doctor K., New York, asks: "How can I color a solution, it should look like olive oil? The coloring matter must not be a dye."

Assuming that our querist wishes to avoid the use of anilin dyes, and handicapped by a complete lack of data as to the nature of the solution to be colored, we can but suggest experimentation with safflower and indigo sulphate mixed in the proportion of about 15 to 1 and digested in the solution. Annatto or turmeric or a tincture of either may be used instead of safflower; and chlorophyll or tincture of grass or spinach may take the place of the indigo.

Green-tinted solutions for show bottles may be made as follows; both solutions are, of course, poisonous. The first formula gives an olive-green.

Copper sulphate.....	35 parts.
Hydrochloric acid.....	16 parts.
Iron subcarbonate.....	4 parts.
Water	450 parts.

Disolve the iron salt in the acid and the copper salt in the water; mix the solutions.

A solution with a more yellowish tint may be made with

Iron sulphate.....	10 parts.
Sulphuric acid.....	10 parts.
Copper nitrate.....	enough.
Water	280 parts.

Dissolve the iron salt and the acid separately in 140 parts of water; mix the solutions, and add little by little the copper nitrate until the desired shade is reached.

Cuticura.—J. J. P., Pennsylvania.—At various times we have stated in these columns that we had no knowledge of the composition of this nostrum, but had seen a statement that it consisted of petrolatum, containing 2 per cent. of phenol; and colored green, and perfumed with oil of bergamot. This nostrum is referred to in *Secret Remedies*, a book published by the British Medical Association (see the CIRCULAR for January, 1910, page 10) in the following words:

It consisted of a mixture of hard and soft paraffins, slightly perfumed with rose, and colored green. The chief green coloring matter present appeared to be an anilin dye . . . No other ingredient could be discovered.

"Lapis Baptista."—F. K., New York.—"Lapis baptista" is an old-time synonym for talc, soapstone, magnesium silicate, that seems to find favor with practitioners of cosmetics. This name for talc appears in the works of one or more European writers on cosmetics. It is said that the name originated through the use of soapstone for the construction of baptismal fonts in the churches of Venice and other Italian cities.

Base for Soft Sand Soap.—Aside from its expensiveness the soft soap of the Pharmacopœia is an excellent base for the popular hand-cleaning abrasive pastes. Linseed oil soap is somewhat more detergent than the products of other vegetable oils, but linseed oil is far from cheap. A mixture of 10 parts of cottonseed oil and 2 parts of lard, saponified with a sufficient quantity of a mixture of equal parts of sodium hydroxide and potassium hydroxide, makes a soap having good cleansing and lathering properties.

In a recent number of the *American Journal of Pharmacy*, J. K. Thum, offers the following formula for a gritty hand-cleaning soap:

Stearic acid.....	500 grammes.
Cottonseed oil.....	500 c.c. (mils).
Sodium hydroxide.....	150 grammes.
Sodium chloride.....	200 grammes.
Alcohol	150 c.c. (mils).
Water	2,000 c.c. (mils).
Powdered pumice.....	300 grammes.

The acid and the oil are heated together until the first is dissolved; the sodium hydroxide dissolved in 1000 c.c. (mils) of water is poured into the fatty mixture, and the batch is heated for fifteen minutes with constant stirring. The alcohol is then stirred in and the stirring continued until the mixture becomes homogeneous. A solution of the sodium chloride in the rest of the water is stirred into the soap mass, and when the mass has hardened the watery liquid is drained off. After the mass has been washed several times with distilled water it is melted and while it is soft the pumice is incorporated and the soap poured into molds to harden.

This is a hard soap but by using an equivalent quantity of potassium hydroxide to replace the sodium hydroxide, and modifying the process by omitting the salting out with the solution of sodium chloride, the melting and the molding, a satisfactory soft product might be secured.

Hand-cleaning pastes should contain an excess of alkali. The abrasives generally used are powdered pumice and fine sand. For some purposes a moderately hard soap containing about 2 per cent. of incorporated kerosene oil in addition to the abrasive, is particularly well adapted. Solution of sodium silicate is said to be present in some of these soaps; it is frequently used as a weighter in cheap soap; its detergent properties are practically nil.

A number of formulas for hand-cleaning preparations appear in the CIRCULAR for March, 1910, page 118, and for February, 1908, page 75.

Picric Acid Stains.—"Hoosier," Indiana, writes: "Do you know of an 'antidote' for a pair of trousers which have been accidentally decorated with Esbach's reagent (picric acid)?"

Picric acid stains are wonderfully tenacious, whether upon fabric or fingers, but it has been reported that these stains may be removed from the skin by washing in milk or a light sugar-and-water syrup. Because of its solvent properties ether might be of use as a stain remover. If used its high inflammability must be borne in mind. The color of the stains can be somewhat reduced by repeatedly saturating them with a concentrated solution of sodium hyposulphite.

Liquid Green Soap.—C. B., Maryland.—Presumably the liniment of soft soap of the Pharmacopœia has not proved satisfactory for your purpose. As its shortcomings in this instance are not known to us we hazard the appended formulas for similar preparations:

I.

The following process, which originally was described in the CIRCULAR for December, 1910, page 631, we are informed, has been used with satisfactory results by a number of our readers. The product lathers well in hard or soft water.

Coconut oil, fresh.....	250.0 grammes.
Potassium hydroxide.....	65.5 grammes.
Sodium hydroxide.....	13.5 grammes.
Alcohol	400.0 c.c. (mils).
Oil of orris (soap-makers') ..	0.4 c.c. (mil).
Solution of ionone.....	0.2 c.c. (mil).
Chlorophyl green for alkaline liquids	enough.
Water.....	enough to make 1000 c.c. (mils).

Melt the coconut oil in a suitable vessel on a sand-bath, or in a steam-jacketed kettle. Dissolve the hydroxides in 350 c.c. (mils) of water, and pour the solution into the melted oil. Let the mixture boil gently, scraping down the sides of the vessel occasionally, until it begins to "splutter"; keeping the vessel warm, stir the mixture with a paddle for fifteen minutes. Then stir in about 150 c.c. (mils) of water and let the mixture boil as before, scraping down the sides of the vessel and stirring the mixture occasionally. When it has reached the "spluttering" point, stir it for about ten minutes; add 300 c.c. (mils) of water, and bring to a boil, beating thoroughly. Remove the vessel from the fire, or cut off the steam if a jacketed kettle is used; add the alcohol, and stir rapidly until a homogenous mixture is secured. Transfer to a suitable container and set aside to cool, agitating a few times. Filter through a pledget of cotton; add the perfumes and color and enough water to make 1000 c.c. (mils).

II.

This one was suggested by M. I. Wilbert in a paper printed in the CIRCULAR for October, 1907, page 631:

Sodium hydroxide.....	40 grammes.
Potassium hydroxide.....	40 grammes.
Cottonseed oil.....	500 c.c. (mils).
Alcohol	250 c.c. (mils).
Distilled water to make.....	2,500 c.c. (mils).

In a suitable container, preferably a glass-stoppered bottle, dissolve the hydroxides in 250 c.c. (mils) of distilled water; add the alcohol, and then add the cottonseed oil in three or four portions, shaking vigorously after each addition. Continue to agitate the mixture occasionally, until saponification has been completed. Then add the remaining portion of distilled water and mix. The only precautions that Mr. Wilbert considered necessary are to use ingredients of U. S. P. quality, and to be sure that saponification is complete before adding the remaining portion of the distilled water. The water used must be absolutely free from soluble salts of the alkaline earths or the heavy metals and for this reason should be, preferably, freshly distilled.

The soap may, of course, be colored and perfumed as desired.

Purple Spirit of Nitrous Ether.—G. F. T., New Jersey, writes as follows:

Have purchased three batches of [concentrated] spirit of nitrous ether tubes from three jobbers. Date of expiration on each package indicated that they were good. Alcohol used, _____'s. Upon making spirit of nitrous ether, after standing six hours the entire liquid turned light purple. No further change on standing. Slight effervescence on adding potassium bicarbonate, and, after standing over same three days, turned yellow. Can you tell me the cause of the reaction? Also, is the resultant spirit safe to use?

G. F. T.'s experience with this puzzling phenomenon is seemingly unique, as the reaction he describes appears not to have been reported previously. The conditions evidently are not normal and we should be inclined to look to the alcohol container for the disturbing element. If the alcohol had been kept in tin or iron tanks or cans, iron might be present in the spirit in sufficient quantity to produce the purple coloration through reaction with a trace of tannin extracted from a specked cork in the stock bottle. Tannin so accounted for is often responsible for the yellowish color acquired by spirit of nitrous ether kept in a cork-stoppered bottle.

The yellow color produced after adding potassium bicarbonate is more easily accounted for. Alcohol normally contains some aldehyde, and the acid nitrous ether will produce more aldehydes forming yellow compounds with alkalies, hence the yellow color. If the purple coloration was due to an iron-tannin combination it would be destroyed by the alkali, and only the yellow color imparted by the aldehydes would show. The effervescence is due, of course, to the carbon dioxide liberated in the interaction between the potassium bicarbonate and the nitrous acid usually set free in concentrated spirit of nitrous ether which has been kept for some time.

If the foregoing iron-tannin premise be correct we are of the opinion that the spirit is in no way unfit for use.

A Prescription Difficulty.—E. R., California, wishes to know how to make a "respectable-looking mixture" of the following:

R Codein. sulph.....	0.535
Glycyrrh. ammon.....	4.000
Acid benzoic.....	4.000
Ammon. chlor.....	8.000
Spts. anisi.....	8.000
Aq. anisi.....	ad 90.000

M. Sig.: $\bar{\text{Si}}$ every 3 hours.

At best this combination will produce only a "shake" mixture. The quantity of alcohol present is not enough to keep the acid in solution, hence it is better not to dissolve the acid in the spirit because it will be deposited in crystals, whereas if it be rubbed up with the aqueous liquid a fairly good suspension will result. We should dissolve the codeine sulphate in a minimum quantity of the anise water, about 15 c.c. (mils); dissolve the glycyrrhizin and the ammonium chloride in about 50 c.c. (mils) of anise water; rub up the acid with this latter solution; add the alkaloidal solution, and lastly the spirit. Because of the ease with which the last dose or two of a "shake" mixture may contain an excessive amount of the precipitate, the dispensing of such mixtures containing poisonous alkaloids may be attended with grave results. It is always wise to call the attention of the prescriber to this fact before delivering the medicine.

If the prescriber would permit the use of an amount of codeine equivalent to the prescribed quantity of codeine sulphate, and the use of at least 30 c.c. (mils) of alcohol to replace the spirit of anise and some of the anise water, a clear solution could probably be produced.

Liquor Ammonia Anisatus.—L. W. L., New Jersey.—This preparation is official in Germany, the formula of the new German Pharmacopœia being as follows:

Oil of anise.....	1 part.
Alcohol	24 parts.
Ammonia water [10 per cent.].....	5 parts.

The oil is dissolved in the alcohol, and the ammonia water is added. The parts are all by weight.

This formula has been printed in the CIRCULAR a number of times. The formula of the Spanish Pharmacopœia is identical with that given above. In the Hungarian Pharmacopœia the formula is as follows:

Oil of anise.....	3 grammes.
Alcohol [90 per cent., by volume]	75 grammes.
Ammonia water [10 per cent.]... ..	20 grammes.

Dissolve the oil in the alcohol and add the ammonia water.

The British Pharmaceutical Codex gives the following formula:

Anethol	3.5
Ammonia water [10 per cent.].....	16.5
Alcohol.....	enough to make 100.0

Dissolve the anethol in 80 parts of alcohol, add the ammonia water, and as much more alcohol as is required. The parts are by measure.

None of the official formulas calls for stronger ammonia water.

Scale Salts of Iron in Acid Mixtures.—J. O. F., Illinois, has had trouble with the following prescription:

R Syr. hypophos. comp.	
Elixir I. Q. & S.....	aa $\bar{\text{z}}$ iii

Upon mixing the two preparations a light-green clear liquid resulted. The mixture was returned by the purchaser twenty-four hours later, at which time it had the appearance of lead water; no precipitate was deposited. The syrup was made according to the official process; the elixir consisted of 1 ounce of iron and quinine citrate, and 1 grain of strychnine sulphate in sufficient "simple" elixir to make 1 pint.

Although the scale salts of iron are very frequently prescribed in combination with one of the phosphorus acids, it is a well-known fact that, with the exception sometimes of meta-phosphoric acid, these acids precipitate the iron. This trouble is enhanced by the presence of alkaloidal salts. In the mixture under consideration the only procedure that would tend to give relief is to dissolve about 2 drams of sodium chloride in the elixir. An elixir made with tincture of iron citro-chloride as directed in the National Formulary process will usually mix clearly with compound syrup of hypophosphites. A more elaborate note on the troublesome iron-acid-alkaloid combination appears in the CIRCULAR for February, page 79. Patients getting mixtures of this class should be advised not to take any of the medicine if the liquid becomes cloudy for the reasons given in the second preceding note.

Freckle Eradicators.—L. G., New York, wants "the best and noninjurious formula, internal or external, for removing summer freckles."

Were our advice sought by persons who did not adhere to the old belief that "freckles is a sign of health" and who wished to be separated from their ephelides without parting with their epidermis it would be that they enlist the services of a trained physician and dermatologist. Particularly should we point out to them the harmfulness of the majority of the proprietary bleaches and the newspaper prescriptions containing corrosive sublimate.

Even the authorities differ as to the best eradicator for freckles, some favoring diluted solutions (3 per cent.) of lactic or other organic acid, while others, including Joseph, say that alkalies are particularly useful in this connection, and suggest diluted solutions of potassium carbonate. Creams containing cucumber juice or 30-per cent. solution of hydrogen dioxide are extolled by some dermatologists (see the CIRCULAR for February, 1910, page 62); and mixtures of sulphur and liniment of soft soap are in favor. Seemingly it is a case of paying your money and taking the professor-doctor's choice.

Druggists should ply their own vocation, and leave to the "beauty doctor" the questionable practice of disfiguring faces in an attempt to improve upon nature. As an altruist the drug man might advise the use of grandmother's remedy, buttermilk and horseradish, or lemon juice. Formulas for several simple lotions appear in the CIRCULAR for June, 1909, page 288.

Hagee's "Cord. Ext. Ol. Morrhuæ Comp."—E. R., California.—All that we know about the composition of this preparation is that in the advertising addressed by the proprietors to the medical profession the cordial is said to represent in each fluid ounce "the extract obtainable from one-third fluid ounce of cod liver oil (the fatty portion being eliminated), 6 grains calcium hypophosphite, 3 grains sodium hypophosphite, with glycerin and aromatics." Elsewhere we have seen it stated that the alcoholic content of the cordial is 8 per cent.

From a note on the subject of "Tasteless Cod Liver Oil Compound," by H. G. Posey, in the CIRCULAR for July, 1909, page 350, we quote the following formula which is representative of this class of cod liver preparations:

Gaduol	2½ pints.
Oil of orange peel.....	9 ounces.
Fuller's earth.....	10 pounds.
Port wine.....	17 gallons.
Compound tincture of gentian....	5 pints.
Fluidextract of wild cherry.....	2½ gallons.
Glycerin	5 gallons.
Extract of malt.....	4 gallons.
Compound syrup of hypophosphites	6¾ gallons.
Fluidextract of licorice.....	1¼ gallons.
Caramel	2½ pints.
Alcohol	2½ gallons.

A more elaborate formula calling for guaiacol, creosote and eucalyptol, with working directions, appears in the CIRCULAR for June of the same year, page 293.

It will be noticed that there is no cod liver oil called for by these formulas, it being replaced with its so-called "active constituent" gaduol. While such a compound affords the votaries of "elegant" medicine

a fully grasped opportunity, its efficiency, if any, might possibly justly be attributed to some one or more of the various remedial agents other than the gaduol, which it contains. To label such a combination a cod liver oil preparation would constitute misbranding under the federal food and drugs law, as well as under the laws of many States.

Castoria.—G. D. C., Florida.—As we have at various times hitherto stated in these columns, castoria is one of the few "patent" medicines that ever has really been patented. The preparation was for a time protected by letters patent number 77,758, dated May 12th, 1868, issued to Samuel Pitcher. According to the specifications of the patentee, the formula for castoria is:

Senna leaves.....	20 pounds.
Sodium bicarbonate.....	2 ounces.
Essence of wintergreen.....	5 pounds.
Extract of taraxacum.....	1 pound.
Sugar	50 pounds.
Water	10 gallons.

The details of the manufacture of the medicine are given in a copy of the specifications appearing in the CIRCULAR for May, 1906, page 172. In brief the process is to make an extract of the senna in hot water in which the sodium bicarbonate has been dissolved, and to add the other things to this liquid.

A note on the legal status of the name castoria, now that the patent on the preparation has expired, appears in the CIRCULAR for November, 1909, page 588.

Micajah's Medicated Uterine Wafers.—"Physician," New Jersey.—In the *Journal of the American Medical Association* for March 26th, 1910, appeared a report by W. A. Puckner and W. S. Hilpert, of the chemical laboratory of the association, giving a detailed account of an analysis of Micajah's uterine wafers, together with some pertinent comment upon the disparity between the advertised claims for the nostrum and the conclusions to be drawn from the result of the analysis. This report with additional details of the analytical methods employed is reprinted in volume 3 of Reports of the Chemical Laboratory of the American Medical Association which may be obtained from the association at a nominal price and should be read by every physician and pharmacist as well. Reference was made to the report on Micajah's wafers in the CIRCULAR for June, 1910, page 288. From the reprinted report we quote the following:

Micajah's uterine wafers as found on the market are white, hexagonal tablets, odorless and possessing an astringent taste. The wafers are soluble in water with extreme difficulty. Hot hydrochloric acid and alkali hydroxides dissolve the powdered tablets readily, leaving a slight residue which under the microscope and by physical tests was identified as lycopodium.

The acid solution of the wafers responded to qualitative tests which indicated the presence of potassium, sodium, aluminum, sulphate, borate, and a mere trace of fatty material. Quantitative estimations of boric acid, aluminum, sulphate, sodium, and potassium were made, which indicated that Micajah's uterine wafers consist of alum more or less anhydrous or "burnt," boric acid, and borax in approximately the following proportions:

Alum, dried.....	59.86 per cent.
Borax, dried.....	15.62 per cent.
Boric acid.....	5.67 per cent.
Water of hydration.....	18.85 per cent.

The average weight of the tablets is 0.7791 gramme (11.8 grains) and, allowing for the fact that the quantity of water present in commercial exsiccated alum varies,

each tablet would contain approximately 0.4986 gramme (7.8 grains) of burnt alum; 0.2337 gramme (3.6 grains) of crystallized borax, and 0.0467 gramme (0.7 grain) of boric acid.

Relative to the harmfulness of the preposterous claims made in the advertising of this nostrum the report contains the appended comment, the truth of which should be inwardly digested by every physician and pharmacist, and by them inculcated widely among their patients. The report reads:

That such simple astringents and feeble antiseptics as alum, borax and boric acid could have such remarkable curative effects on uterine diseases is absurd. The serious aspect of the matter is, that, by the encouragement given them in the advertising literature to treat themselves, women may neglect proper surgical or medical attention in the early stages of serious diseases such as cancer or dangerous pelvic infections, until they get beyond the hope of proper management. But when nostrum promoters urge the use of such inefficient remedies in the treatment of gonorrhea, it is time to look at the matter seriously. Considering the vital social significance of the venereal disease, the employment of useless remedies can only favor the spread of these infections, which cause such a large proportion of the diseases which afflict women particularly.

Angostura Bitters.—J. J. Z., Porto Rico.—Several formulas for carminative bitters containing angostura bark have been given in these columns during the past decade. The following combination is typical:

Angostura bark.....	16 parts.
Bitter orange peel.....	8 parts.
Canada snakeroot.....	8 parts.
Serpentaria	8 parts.
Cinchona	8 parts.
Gentian	4 parts.
Calamus	4 parts.
Galangal	4 parts.
Cardamom	2 parts.
Cloves	1 part.
Mace	1 part.
Coriander	1 part.
Cinnamon	1 part.
Alkanet	2 parts.
Alcohol	100 parts.
Water	60 parts.

The drugs, reduced to a moderately fine powder, are macerated for several days moistened with some of the menstruum and then extracted by percolation.

Trade-mark rights to the name "angostura" are claimed by the house of Siegert, the contention being that the bitters of that firm is not so called because angostura bark enters into its composition but because the preparation was originated at Angostura. There have been several court decisions in support of the Siegert claim, and the word "angostura" has of late been deleted from the titles of several other brands of bitters.

How Is Pumice To Be "Well Washed"?—C. W. S., New York, asks: "In the National Formulary process for solution of ginger it is directed to use 'pumice, in fine powder, and well washed'; how is it intended to be washed?"

For the purpose stated we are satisfied with powdered pumice washed by being shaken for a few moments with two lots of water, each about five times the bulk of the powder. The water is decanted from the powder; after the second shaking the powder is dried on a piece of filter paper.

We should like to be told how our readers "well wash" pumice. To the members of the N. F. revision committee and of the committee on unofficial standards of the American Pharmaceutical Association this request is especially directed.

Platt's Chlorides.—A. I. M., New York.—Some years ago Dr. Adolph Tscheppe contributed to the *Pharmaceutische Rundschau* a formula based on an analysis of Platt's chlorides, which is as follows:

Aluminum sulphate.....	6 ounces.
Zinc chloride.....	1½ ounces.
Sodium chloride.....	2 ounces.
Calcium chloride.....	3 ounces.
Water.....	enough to make 2 pints.

The following somewhat more elaborate formula for a preparation said to resemble the proprietary article is taken from an earlier issue of the CIRCULAR:

Zinc in strips.....	4 ounces.
Lead carbonate.....	2 ounces.
Chlorinated lime.....	1 ounce.
Magnesium carbonate.....	½ ounce.
Aluminum hydrate.....	1½ ounces.
Potassium hydrate.....	½ ounce.
Hydrochloric acid.....	16 ounces.
Water	16 ounces.
Whiting	enough.

First dissolve the zinc in the acid, then add the other salts singly in the order named, letting each dissolve before the next is added. When all are dissolved add the water to the solution, and after a couple of hours add a little whiting to neutralize any excess of acid; then filter.

It may be added that zinc chloride ranks very low among disinfectants, its efficiency even as an antiseptic ceasing with dilution below about 1 in 500, and that the use of such solutions as these, by giving a false sense of security from disease germs may be the means of spreading rather than of checking the spread of sickness.

More extended articles on the subject of the disinfectant value of the chlorides appear in the CIRCULAR for September, 1908, page 431; and for March and April, 1904, pages 49 and 71.

So far as we are able to learn, Platt's chlorides was never the subject of a patent. The name of the preparation is the subject of a trade-mark granted March 6th, 1906, to Mary E. Platt.

Cascara Laxative Lozenges.—H. D. G., Pennsylvania.—In the Standard Formulary it is stated that *cascarets* are said by the manufacturers to contain cascara sagrada and senna combined with aromatics, each tablet representing 10 minims of fluidextract of cascara sagrada. That is the full extent of our knowledge of the composition of the preparation.

Pharmacists, like explorers in other fields, are too often prone to go far from home to find a starting place from which to strike out toward an accomplishment. It seems to us that were we contemplating the construction of a formula for a laxative preparation to contain cascara sagrada and to take the form of a lozenge, we should look about us and cultivate a closer acquaintance with *confectio sennæ* U. S. P. because in the formula for that preparation there are large possibilities in the way of a pleasing medication of a laxative nature. The addition of extract of cascara sagrada to the confection is not a task call-

ing for superior attainments on the part of the compounder. A moment's consideration of the U. S. P. monograph will lead to the conclusion that the careful application of a gentle heat to the mass would reduce it to the proper consistency. And a bit of reflection will show that the oil of coriander should not be added to the mass until after the heating is completed, and that perhaps the addition of about 2 per cent. of extract of licorice and a reduction in the amount of sugar would be beneficial.

Tooth Paste.—F. E. McKarny, Illinois, contributes the appended formula for a tooth paste which he has found very satisfactory:

Precipitated chalk.....	8 ounces.
Powdered castile soap.....	1 ounce.
Sodium benzoate.....	1 dram.
Saccharin.....	4 grains.
Oil of wintergreen.....	15 minims.
Oil of peppermint.....	15 minims.
Oil of clove.....	15 minims.
Oil of cinnamon.....	15 minims.
Menthol.....	5 grains.
Thymol.....	5 grains.
Zinc sulphocarbolate.....	1½ drams.

Glycerin, a sufficient quantity to make a mass, secundum artem.

We thank Mr. McKarny for the interest he takes in the Notes and Queries department and trust that he may frequently be a contributor to its usefulness. Even though we should prefer a dentifrice less active bactericidally and hence less destructive to the beneficial buccal flora, an antiseptic preparation has its uses.

Preparing Kefir.—M. B., Pennsylvania.—In the CIRCULAR for November, 1909, page 586, we quoted from a paper on this subject read by Thomas J. Keenan before the Kings County (N. Y.) Pharmaceutical Society, as follows:

1. Take of kefir fungus, 2½ drams, soak in a mixture of milk and water, equal parts (sufficient to cover the kefir), for four hours, pouring off and renewing at intervals of one hour, keeping the mixture at a temperature of 80° F.

2. The washed and moist fungus, now in a softened condition, is enclosed loosely in a piece of sterilized gauze and added to one quart of pasteurized milk heated to a temperature of from 80° to 85°. The milk with the kefir is allowed to stand, the same temperature being maintained, for from twelve to fifteen hours, or until curdled. The cream is then removed and the curd separated and allowed to drip until fairly dry, when an equal weight of sugar of milk is added and the whole spread thinly upon gauze, or upon a fiberless filter paper, and allowed to dry in a current of warm air at a temperature of not over 80° F. The mixed substance is then powdered gently and put up in dry, sterilized 1-ounce wide-mouthed vials, bearing some such label as the following:

Directions for Use.

To one quart of milk diluted with half a pint of water add a pinch of salt and a level teaspoonful of the ferment powder. Keep at a temperature of 85° F. for twelve to fifteen hours, shaking or stirring as often as convenient; then bottle and keep on ice.

The author suggested that before bottling and sending out the powder the pharmacist make a control experiment, in order to satisfy himself of the activity of the product and the quality of the milk. This could be done, he said, by taking three bottles of milk and putting into one a pinch of the ferment, into another a pinch of sugar, and leaving the third bottle without any added substance, when if the powder was of the desired activity the milk containing the ferment would be completely curdled at the end of twelve or fifteen hours.

The kefir fungus is obtainable in the general market.

In 1907 Prof. I. V. S. Stanislaus read a paper on the history, chemistry and manufacture of kefir at the meeting of the American Pharmaceutical Association (see the Proceedings for that year, page 465), in which he said:

The following points should be observed in the preparation of kefir: The milk should be fresh, previously skimmed and boiled; the latter condition is imperative to prevent butyric fermentation. It is also advantageous to sometimes add a teaspoonful of lactose to the milk, as in this wise more alcohol and CO₂ are formed and the albuminous bodies undergo peptonization much more readily. Good kefir should be a homogeneous, viscous fluid not readily separating into two layers. Ferrated kefir for anemics is prepared by adding to each bottle 0.1 gramme of ferric lactate. Pepsinated kefir is made by adding 0.75 gramme of powdered pepsin to each bottle.

In *Merck's Report* (xviii, 141) is an article on soured milk, by F. W. Gamble, reprinted from the *Pharmaceutical Journal*, in which appears information concerning the bacilli causing the fermentation of milk, resulting in *yoghourt*, *leben*, and the other milk preparations. Under the title "Fermented Milk" the National Formulary gives some directions for making *kumys* and *kephir-kumys*. In the CIRCULAR for April, page 202, there is a note on "Sour Milk and Longevity" in which Prof. Elie Metchnikoff is quoted at length, and in the issue for January, 1908, page 27, is a note entitled "Metchnikoff on Sour Milk." German to this subject is the brief note on *matzoon* in the CIRCULAR for January, 1906, page 18.

Brass Polish.—W. R. D., Pennsylvania.—When you addressed your query to us you had not yet received your copy of the May issue of the CIRCULAR, on page 256 of which there is given a formula for a polish that we feel sure will answer your purpose, and reference is made to a number of previous issues in which other formulas had appeared. The polish represented by the formula on page 207 of the April CIRCULAR is an excellent one for badly tarnished metal.

If you will acquaint us with any shortcomings you find in any of the formulas referred to we shall endeavor to remedy the defects.

Benzole Benzoate.—J. R. S., Indiana.—Benzyl benzoate, sometimes referred to as benzole benzoate, is benzoic acid benzyl ester existing naturally in benzoin but usually prepared synthetically. It has been used in medicine, and recently has come into quite extensive use in the manufacture of synthetic perfumes, being particularly well adapted as a solvent for artificial musk.

Dealers in perfumery materials and wholesale druggists, generally, can supply this solvent.

Formulas for Hair Tonics.—W. K., New York.—A *Sanitary Bulletin* of the New Hampshire Board of Health issued under date of April, 1907, contained a deal of information about the composition of preparations for the hair. This information was reprinted in the CIRCULAR for September, 1907, page 589.

Sodium Salicylate and Ferrous Sulphate.—W. E. B., Maine.—The red color you observed was doubtless due to the purple tint of the iron salicylate formed by the interaction of the two salts modified by the presence of an oxide of iron.

About "Sebidella."—G. H. Schone, Maryland, writes:

I notice in your Notes and Queries column (last month's CIRCULAR, page 253) that E. L. P., New Hampshire, wants to know what to dispense for "sebidella." Having had years of experience in one of the oldest German drug stores in Baltimore, I have always been instructed to dispense one of the hellebores in powder, with never a "come-back." If this will help E. L. P. out of his trouble he is welcome to it.

In thanking Mr. Schone for the interest he has taken in this matter we are certain that we speak for E. L. P. and many others of our readers. Mr. Schone refers to himself as an "old-timer"; we hope he will oftentimes give the readers of the CIRCULAR the benefit of his long experience.

Doubtless hellebore would prove satisfactory in the matter of destructiveness.

As with *sabadilla* there is danger of this poison's being absorbed to a dangerous extent. And we fancy that the sternutatory properties of hellebore would be much in evidence in the vicinity of a surface dusted with the powder.

A British Prescription.—L. W. L., New Jersey.—We should interpret the prescription you submit as follows:

Compound syrup of hypophosphites.

Easton's syrup.

Parrish's syrup, of each, equal parts.

These three syrups are very popular preparations with the British medical men, although the prescribers usually designate them by their modern Latin titles, thus:

Syrupus hypophosphitum compositus.

Syrupus ferri phosphatis cum quinina et strychnina.

Syrupus ferri phosphatis compositus.

We append the formulas of the British Pharmaceutical Codex for the respective preparations (the parts are by weight for solids and by measure for liquids).

Compound Syrup of Hypophosphites B. P. C.

Calcium hypophosphite.....	1.000
Manganese hypophosphite.....	0.500
Potassium hypophosphite.....	0.500
Quinine hypophosphite.....	0.250
Strychnine.....	0.012
Refined sugar.....	70.000
Hypophosphorous acid.....	0.625
Strong solution of iron hypophosphite.....	5.000
Chloroform water, sufficient to produce.....	100.000

Dissolve the calcium, manganese, potassium, and quinine hypophosphites in 40 of chloroform water, add the strychnine previously dissolved in the hypophorous acid, mix, and add the strong solution of ferric hypophosphite, then add the sugar, dissolve without the aid of heat, make up to 100 with chloroform water, and strain through flannel. The product is a pale, bright-yellow liquid, with a very slight acid reaction.

The strong solution of iron hypophosphite is made as follows:

Strong Solution of Iron Hypophosphite B. P. C.

Solution of ferric sulphate.....	14.20
Solution of ammonia.....	23.00
Citric acid.....	7.60
Sodium hypophosphite.....	9.60
Sodium citrate.....	6.60
Distilled water, a sufficient quantity.	
Chloroform water (1 in 200), sufficient to produce.....	100.00

Dilute the solution of ammonia with an equal volume of distilled water, gradually add the solution of ferric sulphate previously diluted with an equal volume of water,

wash the precipitated ferric hydroxide by decantation with distilled water till free from sulphates, collect on a calico filter, drain and transfer the moist precipitate to a porcelain dish; add the citric acid and 20 of distilled water, heat over a water-bath, with occasional stirring, until a clear solution results, then add the sodium hypophosphite, continue the heating on the water-bath with stirring for about one minute, or until a clear greenish solution is obtained, add the sodium citrate, filter, and pass sufficient chloroform water (1 in 200) through the filter to make up the required volume.

Solution of Ferric Sulphate B. P. C.

Solution of ferric sulphate is prepared by diluting 6.75 of sulphuric acid with 90 of water, and dissolving 72 of ferrous sulphate in the mixture by the aid of heat; then diluting 6.75 of nitric acid with 18 of water, warming, adding the solution of ferrous sulphate, and boiling until, after the sudden evolution of ruddy fumes, the liquid becomes red. The product should be tested for the presence of ferrous salt, and, if any remain, a little nitric acid should be added, the liquid boiled, and sufficient distilled water added to produce 99 by volume.

The solution is a dark-red liquid with a very astringent taste.

Compound Syrup of Ferrous Phosphate B. P. C.

Iron, in wire.....	0.40
Concentrated phosphoric acid.....	7.50
Precipitated calcium carbonate.....	1.35
Potassium bicarbonate.....	0.01
Sodium phosphate.....	0.01
Cochineal.....	0.35
Refined sugar.....	70.00
Orangeflower water.....	3.00
Distilled water, sufficient to produce.....	100.00

Dissolve the iron wire by a gentle heat in a mixture of 5 of concentrated phosphoric acid and 3 of distilled water, performing the operation in a flask plugged with cotton-wool, and keeping the iron completely covered by the liquid. Cool the solution and add it to a mixture of the calcium carbonate with 2.5 of the phosphoric acid and 10 of distilled water; then add the potassium bicarbonate and sodium phosphate, filter, and set aside. Next, boil the cochineal with 37.5 of distilled water, filter, and pour over the filter a sufficient quantity of distilled water to produce 35 of filtrate. Dissolve the sugar in this filtrate by the aid of heat, strain, and cool; then add the iron phosphate solution, and the orange flower water, with sufficient distilled water to produce 100.

Syrup of Phosphate of Iron with Quinine and Strychnine B. P. C.

Iron, in wire.....	0.86
Concentrated phosphoric acid.....	6.25
Strychnine, in powder.....	0.057
Quinine sulphate.....	1.48
Syrup.....	70.00
Distilled water, sufficient to produce.....	100.00

Mix the acid with an equal volume of water, place in a flask with the iron wire, plug the neck of the flask with cotton-wool, and heat gently until solution is effected. Mix the quinine sulphate and strychnine in a mortar with 20 of distilled water, then add the solution of phosphate of iron, dissolve, filter into the syrup, and pass sufficient water through the filter to produce the required volume. The syrup should be stored in small bottles which are quite full.

Doubtless your physician could be convinced that there are preparations official in this country which may replace the British three-syrup combination. We suggest that you direct his attention to compound syrup of hypophosphites U. S. P., syrup of the phosphates of iron, quinine and strychnine U. S. P., and compound syrup of the phosphates N. F.

Methylene Blue Stains.—M. B., Pennsylvania.—Preventive rather than remedial methods are indicated in considering the removing of methylene blue stains from the skin or from utensils. In a note that has gone the rounds of the drug press it is stated that if talcum powder be rubbed over the stains on the hands and then washed off with water the stains disappear. But this does not always work out in practice. How-

ever, one can prevent the stains acquiring permanency by keeping the hands covered with talcum powder while handling the blue and washing in water immediately after the work is finished. Practically the only safe method of removing the stains is by continued washing with alcohol. Although the dye is more readily soluble in water than in spirit, the alcoholic solutions seemingly have less affinity for the skin, as water serves only to spread the stain.

Alcohol may be used to remove the dye stains from mortars and pestles, but as these utensils will permit more heroic treatment the stains may be eradicated more rapidly by using chlorinated lime and powdered pumice, followed with solution of sodium hydroxide.

A Problem in Percentage.—M. S. G., Pennsylvania, writes: "How much alcohol should be added to 5 gallons of a liquid to make it a 20 per cent. alcoholic strength?"

As it is practically impossible to add any alcohol to a given quantity of a liquid without increasing the volume of the total liquids, it is obvious that the amount of alcohol to be added must be proportionate to the volume of the finished product. Assuming that the 5 gallons of liquid contains no alcohol, the amount of spirit required is 20 per cent. of the finished product (allowing nothing for shrinkage), and by difference the original 5 gallons is 80 per cent. of the finished product. Hence the amount of alcohol required is one-fourth of 5 gallons or $1\frac{1}{4}$ gallons. To prove this: 5 gallons plus $1\frac{1}{4}$ gallons equals $6\frac{1}{4}$ gallons, 20 per cent. of which is $1\frac{1}{4}$ gallons. Q. E. D.

Adrenalin Solution with Alkaloidal Salts.—L. P. B., Georgia.—Because of the unstable nature of solution of adrenalin chloride its prescribing in complex mixtures is to be guarded against. The solution however behaves quite well in simple solutions of alkaloidal salts except those forming insoluble chlorides.

In the prescription which you submit—

R Sol. adrenalin chlor. (1-1000)..... 3 iss.
Berberine sulph..... gr. i.
Cocaine mur..... gr. i.
Glycerin..... 3 ii.
Aqua camphoræ..... 3 i.
Aqua destillata q. s..... 3 i.

M. Sig.: Drop in eyes 3 or 4 times daily.

berberine hydrochloride is formed and precipitated. This salt is very slightly soluble, particularly in an acid solution, and the solution of adrenalin chloride is slightly acid. A further trouble with this mixture exists because of the fact that the berberine will take up the free acid of the solution and leave the adrenalin more liable to oxidation; this may result in the darkening of the solution. But the precipitate will contain only berberine salts, the rest remaining in solution.

Hydrastine hydrochloride would be a better agent than a berberine salt in this combination. With this will be formed a clear (colorless) solution, there being no incompatibilities. This substitution should not be made except with the knowledge and consent of the prescriber. It is reasonable to believe that the physician would welcome a suggestion that would certainly be for the benefit of his patient.

Rather than filter any prescribed medicament in which a precipitate has formed, we should decline to compound the mixture without having consulted with

the prescriber. Filtration should be adopted with reluctance in any dispensing operation.

Veterinary Absorbent Liniment.—J. H. S., New Hampshire.—So far as we have any information the composition of *absorbine* has never been divulged for the benefit of the public. Formulas, however, for absorbent liniments of more or less efficacy are very common.

Formula 1 below has never before been published; the preparation it represents is said to have proved valuable in the hands of experienced operators. The other formulas are taken from earlier issues of the CIRCULAR.

I.

Extract of belladonna.....	2 grammes.
Diluted alcohol.....	5 c.c. (mils).
Camphor	60 grammes.
Oil of wormwood.....	60 c.c. (mils).
Oil of sassafras.....	60 c.c. (mils).
Sesame oil, enough to make...	1000 c.c. (mils).

Dissolve the camphor in the sesame oil by displacement, suspending the crushed camphor in a gauze bag just below the surface of the oil in a closed container. Triturate the extract with the diluted alcohol until a soft homogeneous mass is produced; gradually add to this the camphor-oil solution. Finally add the volatile oils.

II.

Spirit of camphor.....	1 pint.
Tincture of capsicum and myrrh...	12 ounces.
Oil of turpentine.....	12 ounces.
Linseed oil.....	4 ounces.
Crude petroleum.....	24 ounces.
Oil of amber.....	2 ounces.
Oil of origanum.....	3 ounces.
Barbadoes tar.....	$1\frac{1}{2}$ ounces.

III.

Sulphuric acid.....	1 oz. av.
Croton oil.....	1 fl. oz.
Corrosive mercuric chloride.....	60 grains.
Oil of turpentine.....	6 fl. ozs.
Camphor	$\frac{1}{2}$ oz. av.
Cottonseed oil.....	8 fl. ozs.

Mix in an evaporating dish the oil of turpentine and the croton oil; add the corrosive sublimate in fine powder and the camphor, and dissolve; then add, a little at a time, the sulphuric acid, taking care that the mixture does not become too hot, and, when all has been added and the mixture has become cool, add the cottonseed oil, and mix thoroughly.

A few of the many issues of the CIRCULAR in which those thoughtful ones who preserve their copies in an accessible manner may find other formulas for veterinary liniments of the absorbent sort are January, 1911, page 19; March, 1910, page 118; December, 1909, page 635; and November, 1907, page 735.

"Cure" for Colic in Horses.—A. I. M., New York.—Permit us first to quote from Diseases of the Horse, a publication of the United States department of agriculture which may be obtained in cloth binding for sixty cents. Referring to colic the authors of the chapter on diseases of the digestive organs say:

The disease of the horse that is most frequently met with is what is termed "colic," and many are the remedies that are reported to be "sure cures" for this disease. Let us discover, then, what the word "colic" means. This term is applied loosely to almost all diseases of the organs of

the abdomen that are accompanied by pain. If the horse evinces abdominal pain, he is likely to be put down as suffering with colic, no matter whether the difficulty be a cramp of the bowel, an internal hernia, overloading of the stomach, or a painful disease of the bladder or liver. Since these conditions differ so much in their causation and their nature, it is manifestly absurd to treat them all alike and to expect the same drugs or procedures to relieve them all. Therefore it is important that the various diseased states that are so roughly classed together as colic shall so far as possible, be separated and individualized in order that appropriate treatments may be prescribed.

The subject is continued with a description of engorgement, obstructive, tympanitic, spasmodic, and worm colics, their symptoms and treatment. Engorgement colic is usually fatal. In the other forms the indicated remedies are such as will overcome the flatulence, ease the pain, and excite excretory movements. A combination of carminatives and anodynes is generally the first-aid medicament, to be followed with an aloes ball, a saline draught, or an enema. Typical formulas for the emergency remedies are as follows:

I.

Compound spirit of ether.....	1/2 ounce.
Tincture of opium.....	1/2 ounce.
Infusion of anthesis.....	1 quart.

II.

Tincture of opium.....	1 ounce.
Tincture of ginger.....	1 ounce.
Spirit of nitrous ether.....	1 ounce.
Chloroform	1 ounce.

III.

Ether	1 1/2 ounces.
Tincture of opium.....	1 1/2 ounces.
Linseed oil.....	8 ounces.

Library Paste.—J. J. Z., Porto Rico.—A paste of the type indicated by this title may be made by simply dissolving white dextrin in about twice its weight of water heated to 160° F. Some antiseptic is required to preserve it. This paste is said to improve with age.

A few more elaborate formulas follow:

I.

Tragacanth in powder.....	20 parts.
White dextrin.....	10 parts.
Wheat flour.....	60 parts.
Glycerin	10 parts.
Cold water.....	40 parts.
Salicylic acid.....	3 parts.
Boiling water.....	400 parts.

Over the tragacanth pour 160 parts of boiling water, stir well and set aside. Mix the wheat flour and the dextrin with the cold water, stir in well, and then add the mixture to the tragacanth. Pour into the batter thus formed the rest of the boiling water, stirring constantly while doing so. Rub up the acid with the glycerin and add to the batter; put the mixture on the fire, bring to a boil, under constant stirring, and let cook for five or six minutes. Let cool and the paste is ready.

II.

Gelatin	50 grains.
Water	10 ounces.
Alcohol	1 ounce.
Oil of cloves.....	1 dram.
Wheat starch.....	enough.
Rice starch.....	enough.

Swell the gelatin in the water for a day, and heat gradually until solution is effected. Allow the solu-

tion to cool to a little below 70° F., and stir in enough of the starches, mixed in the proportion of 2 parts of wheat starch to 1 part of rice starch to produce a thin batter. Heat slowly in a double boiler until the mass thickens and continue the heating until the bulk is reduced about one-sixth, stirring constantly. Remove from the heat and stir in slowly the oil dissolved in the alcohol.

III.

Gelatin	4 ounces.
Water	2 pints.
Flour paste.....	2 pounds.
Solution of sodium silicate.....	1 ounce.
Oil of cloves.....	2 drams.

Soak the gelatin in 1 pint of water until softened, then dissolve with the aid of a gentle heat. While hot pour in the paste diluted with the rest of the water, and stir in the solution of silicate, while the mixture cools, using a wooden paddle. When cold beat in the oil.

Other formulas for pastes of this sort appear in the CIRCULAR for October, 1908, page 469, as well as many earlier issues.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Sanford's Liver Invigorator.—F. E. S., Michigan.

Casler's Oriental Paste.—P. P., Illinois.

Fidol.—R. C., New York. Where may it be obtained?

Potassium Chlorate Tooth Powder.

The following is the formula of the Royal Dental Hospital (London):

Powdered soap.....	4 drams.
Sodium bicarbonate.....	2 drams.
Potassium chlorate.....	2 drams.
Powdered orris.....	4 drams.
Saccharin	8 grains.
Oil of peppermint.....	8 minims.
Oil of gaultheria.....	16 minims.
Precipitated chalk, enough to make.	8 ounces.

Eau Dentifrice.

Oil of spearmint.....	10.0 grammes.
Oil of anise.....	2.0 grammes.
Oil of star anise.....	2.0 grammes.
Oil of cloves.....	2.0 grammes.
Oil of cinnamon.....	1.0 gramme.
Oil of rose.....	0.1 gramme.
Tincture of benzoin.....	10.0 grammes.
Tincture of cochineal.....	8.0 grammes.
Alcohol (90 per cent.)	
enough to make.....	1,000.0 c.c. (mils.).

Creamy Furniture Polish.

Animal oil soap.....	1 ounce.
Solution of potassium hydroxide....	5 ounces.
Beeswax	1 pound.
Oil of turpentine.....	3 pints.
Water, enough to make.....	5 pints.

Dissolve the soap in the lye with the aid of heat; add this solution all at once to the warm solution of the wax in the oil. Beat the mixture until a smooth cream is formed, and gradually beat in the water until the whole is completely emulsified.

Missouri Board Questions.

Herewith are reprinted the questions used by the Missouri Board of Pharmacy at an examination held January 9th, 1911. Other sets of questions asked by this board appear in the issues of the CIRCULAR for December, 1909, page 643; November, 1908, page 576; June, 1907, page 424; and July, 1906, page 254. In all these the questions numbered fifteen and were not sub-divided into papers on "Pharmacy," "Chemistry," etc.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Registered Pharmacist.

Pharmacy.

1. What is the difference between an Avoirdupois ounce and an Apothecary's ounce? How many 2 gr. Quinine Pills can be made from an ounce bottle of P. & W. Quinine? At 30 cts. an ounce what will 4 dz. of the pills cost?

2. Name 3 official Emulsions, and state how they are made. In addition to the above write out the formula for 8 ounces of 50% Emuls. Cod Liver Oil, each fluid drachm containing also 3 minims Oil of Turpentine. Give explicit directions how to prepare this Emulsion.

3. What are Fluidextracts? Name 3 official ones made with a strong alcoholic menstruum. Two where Acetic Acid is also used. And one where water alone is used as the menstruum.

4. What is meant by Potent medicines? Name 5 official Potent tinctures, and state their respective strengths. Name 2 official tinctures made by percolation; 2 by maceration; 1 by solution; and 1 by dilution.

5. Name the official Elixirs and give process of their manufacture. What are these galenicals used for?

6. What must Glycerine be sold for, a pint, if it costs 32 cts. a lb., and you wish to make a profit of 50%? Suppose your gross profit of the business is 75%, and your running expenses 25% of the sales, what must be your daily sales, if you make a net profit of \$9.00 a day?

7. If moist opium containing 10% morphine loses 20% of its weight when dried, what per cent. of morphine does it contain then? The loss of weight is moisture.

8. State how you would prepare the following:

R Potass. Chlorat.....gr. X
Acid Hydrochlori.....MX
Syrup Aurant.....3i
Aq. dest. qs. ad.....3viii

Mft. sec. art.

Sig. Half tablespoonful every 4 hours.

9. R Potass. Iodid.....3i
Adeps Lanae.....3i

M. ft. ungt.

Sig. Use locally.

R Hydrarg. Bichlorid.....gr. iii
Potass. Iod.....3ll
Syr. Feni Iodid.....3i
Ag. dest.....3i
Syrup simplicis qs. ad.....3vi

M ft. sol.

Sig. As directed.

What is the amount of Bichloride Mercury in each C. C. of this R?

10. R Potass. Permanganat.....gr. X
Ft. mass et div. in pil No. X.
Sig. One every 4 hours.

R Cresote.....MXX
Eucalyptol.....MXL

M ft. capsule No. 20.

Sig. One, 3 times a day.

In these last 2 prescriptions state explicitly how you would compound them.

Chemistry.

1. What is the difference between Organic and Inorganic Chemicals? Name 5 of each group.

2. State the difference between Ethyl, Methyl and Denat-

ured Alcohol. Is there any law regulating the sale of them? If so, what is it?

3. Name 5 official coal-tar derivatives, giving their medical properties and doses.

4. What do the following symbols stand for: HI, HBO₃, HCN, H₃PO₄, CHCl₃, C₂H₅OH, C₂H₆O, CaCO₃, NH₄Br, H₂O₂?

5. In making Spts. Minderari what chemical action takes place? Demonstrate by means of the chemical symbols.

6. What are the chemicals used in making Fowler's Solution? State how the reaction takes place.

7. What is Diluted Hydrocyanic Acid, and how is it made? What is its strength, and average dose?

8. What is the chemical name for Lime? What is its symbol? When water is mixed with Lime, what occurs?

9. What is the chemical name for Prepared Chalk? That of Precipitated Chalk? Write the symbol of each. What is their medical property and dose?

10. Write the chemical name, and symbol of each of the following: Red Precipitate, Corrosive Sublimate, Blue Vitriol, White Vitriol, Calomel, Oil of Vitriol, White Precipitate, Green Vitriol, Alcohol, Water.

Materia Medica.

1. What is the difference between physiological and therapeutical property. Give an illustration in each case.

2. How are plants classified by the botanist? Name 2 official drugs, belonging to the N. O. Umbelliferae. Two to the N. O. Composetae.

3. What medicines are obtained from milk? What from the hog? From the fish? From insects?

4. What is meant by the term poison? Can one be poisoned other than by the mouth and stomach? If so, how?

5. Name an official drug and its habitat of the following: a root; a rhizome; a tuber, a bulb; a wood; a bark; an herb; a leaf; a fruit; a seed.

6. Describe Gentian root, giving its habitat and medicinal properties. Name 2 official preparations containing it.

7. Where does Cinchona grow naturally? What is its medical properties and dose? Name two of its alkaloids, and state their doses.

8. What is Theobromo? Kino? Terebinthina? Crocus? Amylum?

9. Name 5 crude drugs that are imported into this country, stating where from. Also name 10 official crude drugs, indigenous to Missouri.

10. Name 5 derivatives from coal-tar. Is Creosote obtained from coal-tar or from other sources? State its average dose and medical property.

Assistant Pharmacist.

Pharmacy.

1. What is Pharmacy? Name 3 text-books that should be in every pharmacy?

2. What is the U. S. Pharmacopœia? What is a Dispensatory?

3. Under the present laws of this State what are the requirements to become an Assistant Pharmacist? What those for a Registered Pharmacist?

4. What are the restrictions in selling poisons?

5. Reduce the following to grains: 1 Pt. Distilled Water, 3½ ounces Quinine Sulphate, Glycerine 3xii, 1 Liter Ether.

6. What is the difference between a Syrup and an Elixir? Name 3 official ones of each.

7. What is an Emulsion? Name 2 official ones, giving method of preparation. Is milk an Emulsion? If so of what?

8. How much Opium does each fluid drachm Paregoric represent? The same amount of Laudanum? What is the average dose of Morphine Sulph?

9. What is the official name of Sweet Oil? Of Foxglove? Of Brown Mixture? Of Fowler's Solution? Of Calomel?

10. Upon receipt of a lot of drugs and sundries, how do you proceed in getting them ready for sale? State accurately each step taken, until every item is accounted for, and the invoice ready for filing.

Chemistry.

1. What is Synthetic Chemistry? Analytical Chemistry? Give an illustration of each.

2. What is Specific Gravity? Give that of Water, Glycerine, Alcohol, Nitric Acid. How much does 1 pint Glycerine weigh? 1 Pint Ether?

3. State what is meant by the terms: Solid, Liquid, Gas. Name 3 elements of each?

4. Define the following terms: Fusion; Ignition; Reflection; Refraction; Boiling.

5. What are the freezing and boiling points of the Centigrade and Fahrenheit thermometer scales? Convert 40° Centigrade into Fahrenheit, and 60° F. into Centigrade.

6. Does heat contract or expand iron? How is this property of iron overcome in the construction of iron buildings or building of railroads?

7. Give the Apothecaries table of weights. What are the units of weight and measure of the metric system? How many grains in 4 oz. troy? How many C. C. in 2 fl. oz. water.

8. What is a Barometer? A Hydrometer? A Urinometer? What is the air pressure at sea level? Before a storm does the Barometer rise or fall? Why?

9. Describe Oxygen, and state how it is made? Combined with H. what 2 official drugs are formed? How is Chlorine made? Describe it. Give the symbol of Hydrochloric Acid (its molecular weight, and physical property?)

10. Name 2 metals, not compatible with water. What happens when they come in contact with water? How must these elements be kept? Give the name of an element that must be kept under water.

Materia Medica.

1. Define the following terms, and name an official preparation of each: Rubefacient; Vesicant; Caustic, Haemostatic.

2. Define the following terms, and give an example of each: Diuretic, Diaphoretic; Hypnotic; Narcotic.

3. What is Physiology? Name 5 organs of the human body, excluding those of the head, and state their respective functions.

4. What are the normal number of respirations of man each minute? Pulsations? Temperature?

5. What is meant by the term Toxicology? In an overdose of Belladonna, what is to be done? Explain the action of such an antidote.

6. State the maximum doses of the following: Arom. Sulp. Acid; Salicylic Acid; Ammon. Chlorid; Ammon. Carb.; Potass. Acet.; Potass. Iodid.; Mercuric Chloride; Chloral Hydrate; Tartar Emetic; Codeine Sulphate.

7. What are the antidotes in case of poisoning by Ipecac? By Aconite? By Capsicum?

8. What is Ergot, and how is it obtained? Give the source of the following: Rhubarb; Senna; Mace.

9. What is Botany? In what respect is a knowledge of it, useful to the pharmacist?

10. Name 8 different parts of plants, giving an official example of each.

Spelling and grammar were considered in rating the answers.

Answers to May Questions in Drug Store Mathematics.

1. \$0.343.
2. 7 dozen.
3. Yes; he would save 10 cents.
4. \$2.434.
5. 0.27 per cent. of alkaloids.
6. 10 per cent.
7. 6 ounces of lemon juice, 54 ounces of water.
8. 0.6335.
9. 1.759.
10. 3.27+ per cent.

In the answers to the April questions printed in last month's CIRCULAR, page 268, the decimal point in the first figures is an error; the clerk's net earnings are \$6970.00.

Recovery of Platinum from Wastes.

Blair (*Journ. Indust. and Engineering Chem.*) says that from alcoholic washings of platinum chloride the platinum may be completely separated as metal by allowing the solution to stand for some weeks in direct sunlight. The same reduction will take place in the water solutions of potassium chloroplatinate if a little alcohol is added.

Some Synthetic Scents.

The appended formulas are taken from La Parfumerie Moderne. The odorous compounds are adapted for the perfuming of soaps or creams, or by dilution with cologne spirit or benzyl benzoate as handkerchief extracts or toilet waters.

Bouvardia.

Oil of orange flowers.....	6.00 grammes.
Synthetic jasmine.....	1.25 grammes.
Muguet	2.50 grammes.

Fraise.

Tolu-ethyl acetate.....	3.0 grammes.
Oil of bergamot.....	1.0 gramme.
Synthetic ylang-ylang.....	0.2 gramme.
Artificial musk.....	0.2 gramme.

Iris.

Artificial violet.....	3.75 grammes.
Synthetic aubépine.....	1.00 gramme.
Rhodinol	0.25 gramme.

Heliotrope.

Vanillin	3.75 grammes.
Terpeneless oil of bergamot.....	1.00 gramme.
Oil of bitter almond.....	0.10 gramme.
Rhodinol	0.15 gramme.

Reseda.

Linalol	60.0 grammes.
Benzyl acetate.....	10.0 grammes.
Penyl-ethyl alcohol.....	20.0 grammes.
Duodecyl alcohol.....	0.5 gramme.
Artificial tuberosa.....	1.0 gramme.
Artificial cassie.....	8.0 grammes.
Natural jasmine.....	0.5 gramme.
Tolu-ethyl alcohol.....	65.0 grammes.

Extensive Poisoning by Hyoscyamus Niger.

Phillipi and Mühle (*Münch. med. Woch. through Med. Rec.*) report an instance of extensive poisoning by hyoscyamus niger in a food stuff. A number of people partook at once of roast meat, potatoes, and "blackroot." Within two hours all exhibited evidences of poisoning by some member of the solanaceæ family. Mydriasis was present. The "blackroot" (*scorzonera hispanica*) could not in itself be toxic, but was evidently mixed with or replaced by a weed containing hyoscyamus (*hyoscyamus niger*). This was apparently a result of careless harvesting, the blackroot having been accidentally mixed with the toxic plant. The symptoms induced were of the type caused by the solanaceæ, with the differential marks which distinguish hyoscyamus from other members of the group.

Determination of Lithium.

Murmann (*Zeit. anal. Chem. through Journ. Soc. Chem. Ind.*) says that lithium may be determined in a mixture containing its chloride, with chlorides of sodium and potassium, by extraction with pyridine, in which the latter salts are insoluble. The pyridine extract is evaporated to dryness, and a slight excess of dilute sulphuric acid is added to the residue, after which the mixture is again evaporated, and the sulphate finally ignited and weighed. A trace of lithium remaining with the chloride residue may be recovered by dissolving this in water, evaporating and again extracting with pyridine. The alkali chloride mixture must not be heated to redness, or very appreciable loss of lithium occurs.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

College Students and Board Examinations.

Pittsburg, Pa., May 15th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Referring to the item in the CIRCULAR for last month, page 238, on college graduation and board examinations, I want to say in explanation that 119 applicants were examined at our February meeting, 63 for assistant's license, who were not graduates, and 56 graduates for pharmacist's license, 13 of whom were successful.

Of this failure the Philadelphia College of Pharmacy had 20 per cent. This college gives a doctor of pharmacy degree on a term of three years.

The Pittsburg College of Pharmacy had also a 20 per cent. failure; it gives a graduate in pharmacy degree on a term of two years.

The Pennsylvania Board of Pharmacy in adopting a standard for the recognition of pharmacy schools was obliged to take a stand, and adopted the 1100-hour course, to be taken in two years. Of these 1100 hours, 500 must consist of laboratory work. Some schools remonstrated, and in due course of time we discovered that some schools permitted a "rebate non-attendance" of 25 per cent. in time, and then complained because so many of their graduates failed to pass the board's test. And so we were obliged to exact a certification of *attendance* of at least 1100 hours.

It should be remembered that schools of pharmacy teach fundamental principles, and that the examination of pharmacy boards should be so directed as to ascertain if the individual can practically apply those fundamental principles when occasion demands.

Until more uniform methods are adopted for graduation by schools of pharmacy, we shall not get more uniform methods from pharmacy boards.

LOUIS EMANUEL.

[From the foregoing it would appear that the proportion of college graduates "plucked" by the Pennsylvania Board of Pharmacy at its February examination of applicants for first-class certificates was not 106 out of 119, or 89 per cent., but 43 out of 56, or about 77 per cent. This comparatively slight difference, however, does not affect the point we endeavored to make last month, namely, that there is seemingly a wide difference of opinion between some college examiners and some board examiners as to how much a young man should know before he is ready to follow the calling of a pharmacist. We are glad to publish Mr. Emanuel's letter and should be pleased to receive others on this subject from other board and college men, to the end that our last month's suggestion be made to bear fruit; the said suggestion being that we pharmacists ourselves locate the trouble and remedy it before the muck-raking lay press holds our inconsistencies up to the world's ridicule.—Editor THE DRUGGISTS CIRCULAR.]

Wood Alcohol Prescribed for Bathing.

Pennsylvania, May 21st, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Is it right to use wood alcohol for sponging a sick child? What should the druggist do in this case if the doctor persists in prescribing it? "PUZZLED."

[Among those persons who have secured their knowledge in the school of practical experience—we refer to the workers in wood distilleries—there is a much-respected tenet that wood alcohol may not without danger be allowed to come in contact with the body above the waist-line. Painters and varnishers have a similar fear of this spirit and a greater fear of its vapors, which, it has at various times been reported, have affected grievously varnishers working in confined spaces. We reiterate here the unqualified opinion which we have voiced on many occasions, that the use of wood alcohol upon or near the body is attended with the risk of injury to the optic nerve. Conditions will largely influence the action to be taken by a druggist with regard to a prescription for wood alcohol for use on the body. He should refuse to dispense the spirit under any circumstances. Whether he should warn the person presenting the prescription, of the risk of danger the use of the spirit would entail would depend upon the position taken by the prescriber.

In this connection we have on a previous occasion quoted as follows from *Merck's Report*: "We cannot too strongly condemn the use of wood alcohol in any preparation whatever, intended for use either externally or internally. Numerous experiments and observations have shown that wood alcohol is exceedingly dangerous to the human being. Even small doses have repeatedly been known to cause partial to absolutely total blindness, and like results have been seen in cases where a person has been exposed only to the vapors of wood alcohol."—Editor THE DRUGGISTS CIRCULAR.]

Coffee Glaze Containing Arsenic.

Nottbohm and Koch (*Zeit. Unters. Nahr. u. Genusm.* through *Journ. Soc. Chem. Ind.*) says that shellac is one of the substances which are used for glazing coffee beans, and draw attention to the fact that shellac is sometimes colored by the addition of arsenic trisulphide. Samples of such colored shellac were found to contain from 0.0785 to 0.12 per cent. of arsenic. Coffee beans which had been glazed with arsenical shellac were found to be strongly contaminated with arsenic. The author is making inquiries as to whether shellac containing large quantities of arsenic is actually sold for the purpose of glazing coffee beans.

Compound Insect Powders.

I.

Powdered pyrethrum.....	14 ounces.
Powdered quassia.....	6 ounces.
Powdered white hellebore.....	2 ounces.

II.

Powdered pyrethrum.....	8 ounces.
Powdered colocynth.....	4 ounces.
Powdered white hellebore.....	16 ounces.

These powders are of especial value in combatting plant lice.

Notices of Books Received.

THE CHEMISTRY OF SYNTHETIC DRUGS. By Percy May, B. Sc. (Lond.) Octavo; cloth; xiii + 229 pages. \$2.25. London, and New York: Longmans, Green, and Co. 1911.

Because of the frequency with which the synthetic medicinal products are prescribed in combination with all sorts of organic and inorganic substances, often with the threatened loss of their therapeutic identity, it behooves the dispensing pharmacist to have a wide knowledge of the chemical structure of synthetics and the relation of structure to therapeutic effect. Something more than a good grounding in organic chemistry is needed; and to supply this something is the stated purpose of the author of the book under consideration. In this endeavor he has had recourse to much of the literature emanating from the large manufacturing concerns, and has drawn upon Frankel's *Arzneimittelsynthese*, a work not available in the English language.

As an idea of the nature of the book it may be said that the chapters deal with such subjects as The Effect of Various Elements and Radicles, The Chemical Changes of Drugs in the Organism, Alkaloids (general and group properties), Adrenaline and Other Derivatives of Ethylamine, Purine Derivatives and Uric-Acid Solvents, etc. The text is quite comprehensibly constructed, and by the plentiful use of graphic formulas the most abstruse subjects are greatly clarified.

NEW AND NONOFFICIAL REMEDIES, 1911; Containing Descriptions of the Articles Which Have Been Accepted by the Council on Pharmacy and Chemistry of the American Medical Association, prior to January 1st, 1911. Duodecimo; cloth; 282 pages. Chicago: American Medical Association. 1911.

With each succeeding yearly edition this semi-official book of pharmaceutical standards increases in value to pharmacist and physician. Two years ago, referring to the 1909 edition, we ranked the N. N. R. next to the Pharmacopœia and the National Formulary in usefulness; because of the more frequent revisions of the N. N. R. the information it contains, embracing about 1200 references, is more advanced than that of the official books.

New and Nonofficial Remedies may be obtained from the association at a price representing but a small fraction of its value.

PRACTICAL DIETETICS with Reference to Diet in Disease. By Alida Frances Pattee. Sixth Edition, revised and enlarged. Duodecimo; cloth; 527 pages. \$1.50. Mt. Vernon, N. Y.: A. F. Pattee. 1910.

To know that in seven years this work has reached its sixth edition is to get an idea of the popularity it enjoys. The subject is one of universal interest, and the practical nature of Miss Pattee's treatment of the subject makes the book a useful addition to the library of doctor, druggist, nurse and home.

REPORTS OF THE CHEMICAL LABORATORY OF THE AMERICAN MEDICAL ASSOCIATION; Volume 3, January to December, 1910. By W. A. Puckner, Director. Duodecimo; paper; 127 pages. Chicago: American Medical Association.

This third volume of these Reports continues the purpose of its predecessors to furnish in a convenient

style the results of the analytical work carried on under the auspices of the American Medical Association. The analyses have to do largely with nostrums and complex combinations of drugs, and, for this reason, the descriptions of the methods as well as the reported results are of more than ordinary interest to pharmacists.

FUNGICIDES AND INSECTICIDES; a Handbook for the Agriculturist, Giving a Short Description of the Various Fungous Diseases and Insects of Common Occurrence, Containing also Formulæ for the Preparation of Sprays, and Direction for Time of Spraying. Compiled by Arthur R. Maas. Duodecimo; flexible leather; 69 pages, illustrated. Los Angeles, Cal.: Braun Chemical Company.

The contents of this booklet are well summed up in the sub-title, which makes obvious to pharmacists the usefulness of the publication in their business. The information contained in the booklet has been compiled from authentic sources and is arranged in a manner conducive to ready reference.

DIE OFFIZINELLEN ÄTHERISCHEN ÖLE UND BAL-SAME. Zusammenstellung der Anforderungen der 14 Wichtigsten Pharmakopœen in Wortgetreuer Uebersetzung. von C. Rohden. Octavo; paper; 175 pages. Berlin: Julius Springer. 1911.

To the student of pharmacy who is able to read German this work affords an excellent opportunity to make comparisons of the requirements specified for essential oils, balsams and their official components in the pharmacopœias of America, Austria, Belgium, Denmark, England, France, Germany, Italy, Japan, Netherlands, Russia, Spain, Sweden, and Switzerland. The monographs are arranged in the alphabetical order of the Latin titles of the substances.

DIGITALIS STANDARDIZATION AND THE VARIABILITY OF CRUDE AND OF MEDICINAL PREPARATIONS. By Worth Hale. Bulletin No. 74, Hygienic Laboratory of the Public Health and Marine-Hospital Service of the United States. Octavo; paper; 53 + iv pages. Washington: Government Printing Office. 1911.

A pamphlet of timely interest to pharmacists and pharmacologists. Copies may be had on application to the office of the surgeon-general of the service.

CONSUMPTION CURE FAKES Reprinted with additions and Modifications from the *Journal of the American Medical Association*.

A valuable pamphlet which might well replace the "patent"-medicine almanacs and free teas and pills on the "Take one" counter of every drug store.

YELLOW FEVER; a Compilation of Various Publications; Results of the Work of Maj. Walter Reed, Medical Corps, United States Army, and the Yellow Fever Commissioner. Senate Document No. 822, Sixty-first Congress, Third Session. Washington: Government Printing Office. 1911.

A REPRINT OF THE REPORTS OF THE COUNCIL ON PHARMACY AND CHEMISTRY of the American Medical Association with the Comments That Appeared in the *Journal* during 1910.

DRUG STORE ADVERTISING

By M. P. GOULD, of New York

In this department some of the fundamentals of successful drug store advertising will be expounded each month. The aim is to correct errors of advertising and establish the most profitable and advisable methods of building up retail drug trade by means of the powerful influence of advertising.

Prescription Advertising.

This is to be a heart-to-heart talk about prescription advertising. At the head of this column, for a number of years, there has been the statement that in this department, each month, "fundamentals" of advertising and store management are considered.

Sticking to the text, first let us consider, what are some of the "fundamentals" of prescription advertising?

First Fundamental.

The first fundamental in prescription advertising is to make the store look like a prescription store. Some druggists ought to do more thinking, not necessarily more thinking in the same channels in which they now think, but more thinking in cross channels and in other channels. The first requisite of prescription advertising is a prescription store, and the first thing for a druggist to do, who is considering prescription advertising, is to leave his store, walk around the block and then come back and look at his store as a stranger would and note whether it looks like a prescription store.

Does it, or does it not?

Some drug stores look like ice cream parlors—and the proprietors wonder why their prescription advertising brings so few results. Others have the appearance of cross-roads, general country stores; logically their prescription advertising is unsatisfactory. Many stores appear to the customer as simply depots for a thousand kinds of proprietary medicines, yet the proprietors do not know why their prescription advertising should not bring them better results.

He who is seriously desirous of doing effective, profitable advertising—and it can be done with astonishingly big returns—should take a turn around the block and give thought to the aforementioned points when he gets back and looks at his store.

Be it known right here that the most successful prescription drug stores, those that have gotten the best results from their prescription advertising, are those stores manned by live business men with the professional instinct, who have deliberately built or rebuilt prescription stores, stores that have the air of prescription stores as far as you can see them and as closely as you can inspect them.

Second Fundamental.

The second fundamental of prescription advertising is that no newspaper advertisement, circular, letter, sign, street-car card, or other form of advertising which bears the druggist's name should tend to lead the public to believe that his store is not a prescription store. To elucidate this proposition: Suppose the manufacturer of a product which is offensive to morals, or to decency comes to a druggist with a proposition that if he will buy a certain quantity of these goods, for which there may be a demand, his name will be put at the bottom of each advertisement to run in the local paper thereafter three times a week. The druggist accepts the proposition. That large part of the public who look with disfavor upon goods of this character is told by these advertisements that the druggist is a dealer in them. In explanation he may say that the advertisement is not his, but the manufacturer's, who has been allowed to connect the druggist's name with the goods. But he must not forget that the public does not know the circumstances and could not understand them if it did, and the impression is that the druggist is financially interested in the sale of the goods—which to an extent he is—and he alone is held responsible for the advertisement, and there arises the belief that his is that kind of a store. Consequently when he starts prescription advertising his efforts "roll off" the public like "water off a duck's back." No impression is made. The public is not interested, it does not pay any attention to the advertising. The reason is obvious to any one who looks on from the outside.

The second fundamental, therefore, is that in whatever the druggist does he should not take any action which will prejudice the public against his store as a real prescription store.

Summery Suggestions

The things you need for a happy, comfortable vacation trip—or at home. Check over this list before you begin packing.

FOR COMFORT

Talcum Powder
Foot Powder
Cold Cream
Skin Lotion
Dentifrices

Insect Detergers
Toilet Waters
Bath Salts
Sponges
Soap

FOR PLEASURE

Outing Goods
Confectionery
Reading Matter
Sketch Books
Cameras

Talking Machines
Musical Instruments
Playing Cards
Vacuum Bottles
Hammocks

Take them with you or order by mail.

Don't neglect baby. We will keep you freshly supplied with foods and nursery goods.

HAVE YOU A SATISFACTORY FIRST-AID OUTFIT?

(Name and address)

Third Fundamental.

The third fundamental is that the doctor shall understand the good qualities of the druggist's prescription work, and understand that his store as a whole is not working in a hostile manner toward the interests of medical practice. By this it is not necessarily meant that the druggist should be an extremist. It is meant that he should be careful what he does with regard to ready-made patent medicine either nostrums or own-make, and that he should at least work to some measure in harmony with physicians. He should become acquainted with the physicians, he should be friendly to them, and show them that he is treating them fairly.

These results with physicians cannot be accomplished in a day or a month or a year. They are a gradual growth like any real friendship or character. The physicians must be given time to come to a full realization of the standing and meaning of the store as a prescription store. A series of good, straightforward letters to the physicians is nearly always successful. The letters must ring true, must say something worth saying to the physicians, must have a personal, agreeable tone, must be interesting enough to read, must be done well from a mechanical standpoint, and must really represent the store in all of the prescription work which it does. This sounds formidable, but any druggist who is doing good prescription work and considers his prescription department an important one, can find enough to say about his work to enable him to write a letter to the doctors every day in the year, if he wants to.

Letters, like advertisements and like circulars, are made interesting and effective by picking up little points and elaborating on those points, using them as illustrations just as a public speaker does. The old idea of crowing about yourself and claiming big things is passé. Likewise, the old idea of being dull, limited and conservative is passé. The new idea of going ahead, being alive, saying something worth reading, progressing, being ambitious to reach the head in prescription work, being determined to build up a real leadership prescription store is very much in vogue at the present day.

Fourth Fundamental.

The fourth fundamental is that the druggist be a prescription man himself and have every clerk, who handles a prescription, a real prescription clerk. Careless, indifferent, slovenly prescription work should not be tolerated. The proprietor should give serious attention to his prescription department in all its details. He should let it be evident that he wants prescription business, that he will take care of prescription business when he gets it, and that he can do and does the right kind of dispensing. In other words, his heart for a part of each day must be in his prescription department, and his ambition must be to make it be of a real service for the doctors and for the public.

Success in every line is built on service. Service depends on enthusiasm, not outward enthusiasm or bluster or talk, but real hearty enthusiasm, sincere enthusiasm, the kind of enthusiasm that enables him to think out new ways of making his work accomplish more. The druggist who is giving his whole attention to the management of the soda fountain cannot, at the same time, be a good prescription man. If he is giving his attention to cigars or nostrums or toilet goods, he will not be a good prescription man. His prescription department will be only as good as he is good as a prescription man. This does not mean that the proprietor must do all the work; it does mean that his must be the motive power, the controlling factor, the brains and heart in and behind the prescription department.

BRICKS

40c.

Take home a brick of our luscious Ice Cream. Frozen solid; stays solid for hours. All flavors and combinations of the richest, purest Ice Cream to be had. Fruit flavors as natural as nature. Brick Ice Cream is the daintiest of desserts for supper, luncheon, card party or "treat." Bricks measure quarts and pints.

ORDER BY TELEPHONE

if you are in a hurry. We'll keep some on ice as long as you wish. Deliveries anywhere, anytime, at no extra cost. Ice Cream in bulk—a gallon or five gallons if you wish.

(Name and address)

Fifth Fundamental.

When all the foregoing points have been compassed the real starting point is reached. The druggist is now ready to do prescription advertising. He can do prescription advertising and make it pay to some extent without qualifying under the foregoing rules; but we are considering ways of making prescription advertising most successful. We will not be content with mediocre results, we will not be satisfied with getting a small return for our investment in prescription advertising when we might get big returns.

Prescription advertising is not a one-kind advertising; its forms are many. Usually the least expensive and, for the investment, the most successful form is direct letters to the physicians. These letters must go out of the heart of the prescription department and truly reflect that department. Even the ordinary prescription department has ample sources for good letters. Every day something is happening in the prescription department that is worth telling to the physicians. A clerk is cautioned about something. What is said to him is just what others are saying to their clerks. If a doctor heard it he would think more of your store. The thing to do is to write it, properly worded, to the doctor.

Letters to the public are good prescription advertising. All that has been said about physicians' letters applies to the letters to the public.

Street car cards are good prescription advertising, but expensive. Nevertheless, it must be remembered that the more people come to the prescription department the more they buy other goods of all kinds.

Circulars are good prescription advertising provided they are good circulars. Some druggists say that they do not believe in circular advertising. They have tried it, and it has brought no results; but in the circulars that they used the vital factor of copy has been slighted. Copy is the wording of the advertisement in whatever form it may appear. One retailer writes an advertisement which makes his five-inch double-column space in a newspaper

very profitable; another retailer writes an advertisement to occupy a five-inch double-column space in the same newspaper, and it brings no results. The first retailer puts another advertisement in the same space, which brings few results. The second retailer writes another advertisement, for his space, which brings big results. Results vary with the effectiveness of the copy and the medium and with the conditions under which it has been used. Circulars are one of the most effective forms of advertising when the circular contains good copy, adapted to the store which is issuing it and to the peculiar conditions of the time and place when and where it is used.

Newspaper advertising is good prescription advertising under the right conditions. The only question to decide about newspaper advertising is: Are enough of the papers used in the store's territory to give a reasonable prospect of success in proportion to the cost. When that question is decided, it is up to the copy-writer to make good.

Good prescription advertising may be done through a store paper, particularly in instances where the store is of high quality and reflects high-class prescription work in all that it says and does.

When the various methods of prescription advertising are considered, and the particular form best suited to the store has been determined, the drug store that looks and is a prescription store can soon be made known as one.

The Gentle Art of Shopping.*

BY BRUCE LOGAN.

Scene.—Modern Pharmacy (gushing lady enters and knocks over a scent-spray and a packet of toilet-oatmeal). The pharmacist's efforts to speak are between the paragraphs.

"Oh, dear! dear! Whatever have I done? Oh, I am so sorry!"

"No! no! Don't bother, Mr. Tilpile. I'll pick them up. It's really my fault."

"Oh, I am so sorry; but I'm afraid this box has cracked a little" (holds up a mutilated packet from which the oatmeal gushes forth).

"Oh, but it does matter, Mr. Tilpile, though really I didn't touch it! well, if I did touch it, it was ever so gently."

"There now. It really doesn't look much worse, though I'm afraid you'll have to sell it a little cheaper. But, then, you'll not mind that. You chemists get such big profits."

"No, really, don't say that, Mr. Tilpile, because I happen to know. Well, I ought to know, seeing that my step-sister's husband is a doctor, and he tells me things."

"Really, Mr. Tilpile, I don't know how you can say such

Your Prescriptions

Without doubt, the need for medicines is just as frequent in summer as in winter. At all seasons be sure to bring or send your prescriptions to us, and be sure of drugs of known quality and freshness, ample and adequate facilities for scientific compounding, knowledge and training in our work—there's the combination for safety, results and satisfaction.

(Name and address)

things! Everybody knows that you put a lot of colored water in a bottle and charge a shilling for it!"

"Oh, what a lovely little scent-spray! What kind of perfume is it?"

"Lily of the valley? Really! I simply adore lily of the valley."

"May I have a spray? Oh, thank you! I didn't like to ask, but really I suppose you put it there for people to try."

"Oh, isn't it lovely! I do love it!"

"One and sixpence an ounce! Oh, dear! How frightfully expensive! Rather pungent, too, isn't it?"

"No, thank you, not at present. I've such a lot of bottles at home! I'll leave it till I call again."

"Now, whatever did I come for? Oh, dear! dear! my memory gets worse and worse! Now isn't that funny! I came to get something and can't think what it is. But all my family on mother's side are like that. You didn't know my Aunt Margaret, did you, Mr. Tilpile? No! I thought not. But she was just the same. She died in Yorkshire last June—no, last twelve months. Yes, that's it, seventeenth of June."

"Now, whatever did I come for? Oh, I know! Do you keep Epsom salts? Really, isn't that silly of me; of course you do keep Epsom salts."

"Fourpence a pound! Do you know, Mr. Tilpile, I can get awfully nice salts at the stores at 'tuppence' a pound."

"Oh, no! I'm not grumbling; but really I can."

"Oh, yes, I know! That's what you chemists always say. I'll take quarter of a pound, please."

"Thank you! Good morning!"

Chinese and their Physicians.

In reply to a correspondent, the *Journal of the American Medical Association* says that the oft-repeated story, to the effect that the Chinese pay their physicians to keep them well, and cut off the pay when they are sick, is untrue.

"All authorities acquainted with China agree that the method is so seldom met with as practically not to exist," says the *Journal*, which adds: "Were there such a custom the physician (though that is hardly the term to apply to the native malpractitioner) would promptly go out of business, for his clientèle would speedily develop real and imaginary cause for reducing his income to zero."

A league of the aviadores (rubber merchants) of Para, Brazil, has been formed for the purpose of putting the price of rubber beyond the influence of speculation. Stock subscriptions amounting to 1,000,000 milreis (about \$300,000) have been received and it is reported that State and federal aid will be forthcoming in the effort to prevent the continuous depreciation of values. The firms represented in the league control more than half of the exports from Para.

An Altoona (Pa.) man, according to press dispatches, drank the entire contents of a vial of Haarlem oil because he did not know how much constituted a dose and because there was no dosage information on the label. A physician (the press dispatch does not say why one was not first consulted) succeeded in saving the victim for future usefulness.

The *Detroit Free Press* says that the new pharmacy of Charles F. Mann, at 901 Woodward avenue, that city, sets a high-water mark in store furnishing and general appearance. Such a record in a city boasting that its business establishments are a fit part of "Detroit the Beautiful," is one to be proud of.

Entering largely into the make-up of R. A. Tamasco, drug clerk, of San Francisco, Cal., is "the stuff of which heroes are made." A press dispatch has it that this doughty druggist floored a bad bandit with a swing on the jaw, albeit the bandit had a big gun jammed against the druggist's breast.

Several local druggists are implicated in a system of perfume stealing recently unearthed in this city. Park & Tilford were the victims through the pilfering of an employee, high-grade imported perfumes to the value of \$30,000 having been abstracted from the firm's stock at different times.

E. L. Scholtz, of Denver, Colo., has been elected president of the new Denver Retail Merchants' Association.

* From the Chemist and Druggist, London.

FOUNTAIN FACTS AND FORMULAS.

Flirting with the "Fans."

Base-ball "rooters" are, from the nature of their avocation, a thirsty crowd. They are good spenders, too, and stickers, as their devotion to the home team proves. Therefore they are a worth-while class to enroll among the patrons of one's fountain.

Aside from street-car cards and a board or two at the ball grounds, a window display is the winning play in captivating the trade of the "fans." The thing is to get in early in the season and get the "fans" "rooting" for *your* fountain; if you put up a "good game" in the start-off you can count on enthusiastic support throughout the season.

Here's a hint that may prove a drawing card to open the season:

Roll up a couple of Sunday newspapers to form a rough sphere about 18 inches in diameter. Shape this up a bit by winding a few rods of wrapping twine around it; pad it out smooth with cotton batting, and cover it with white crape paper cut in the dumb-bell pattern of the regular base-ball cover and glued fast. Imitate the stitching with a pen and ink; hang your "baseball" in the center of the window space on a line with the eyes of the passer-by. Letter the front side of the ball thus:

The Regulation Fan's Drink

is

"Rooter's Refresher"

5 cents.

Lay out the window floor with sand and green sawdust to resemble a ball field with bases and all. Line up opposing teams of small dolls in baseball uniforms, and if feasible have "bleachers" in the background filled with spectators. All around the outer edge of the field place colored carboard signs lettered somewhat as follows:

You can holler twice as loud after a drink of Rooter's Refresher	ROOTER'S REFRESHER always a SURE HIT
---	---

A Rub-Down for Dry Throats ROOTER'S REFRESHER 5 cents
--

Every team must lose sometime, but Rooters' Refresher has a perennial winning streak
--

Any slightly acid drink served in big glasses without foam may be called "Rooter's Refresher." A winning combination is a blend of orange syrup 2 parts and mint syrup 1 part with a couple of dashes of lime juice added on serving.

Cleanliness not Everything.

While all writers on soda water emphasize the importance of keeping the glasses clean, there are other things in connection with the business which are of even more importance. This point is well illustrated by an incident related by an anonymous contributor to the *New Idea*, who says:

"The writer happened into a suburban branch of a big down-town drug store and found a boy of about fifteen in charge. He was busily engaged in polishing up the glasses at the fountain. I asked if they served hot chocolate. He bit off a short 'yep' and continued his polishing. 'May I have some?' 'Yep'—more polishing. 'May I have it now?' He looked up in surprise, took me in from head to foot, and answered, 'Sure Mike'—finished his polishing and finally served me with a strange mixture that would have been more properly named had it been called dish water."

An Iowa Arbor and Grill.

During the eight years that the store of the Boyson Drug Company has been located at the corner of First avenue and Third street, Cedar Rapids, Iowa, its business has increased wonderfully. Particularly has there been an unusually rapid development of trade in soda water and luncheons. The busy soda water department centers in the fountain depicted in the accompanying illustration. This is a new "iceless" apparatus opened in February. The counter, which is of solid onyx, is built to accommodate an offset in the room, and the solid mahogany back-bar is also carried around the angle of the offset. To the right of this fountain extends to the rear of the store a room known as "The Grape Arbor." In the grape arbor are about a dozen tables at which sodas and light luncheons are served throughout the day.

The Boyson Fountain.

So successful has been the soda water and luncheon department that Mr. Boyson has recently opened up another room off the grape arbor which he calls "The Soda Grill." This is one of the most beautifully furnished and fitted rooms of the kind in the country. It is illuminated with four large indirect lights hanging from the ceiling, giving it the effect of soft day-light, and a richness which is in splendid harmony with the neutral tints of walls and ceiling. This grill is 23 feet square, and has fourteen side tables for two each, and four large tables in the center, each of which accommodates four patrons. Altogether, 100 persons can be seated and served at one time in the grape arbor, the soda grill and at the fountain.

J. M. Kortlang, the manager of this busy department, was for years with the Myers-Dillon Drug Company and Sherman & McConnell, of Omaha, and is one of the best known soda water men in the West. His experience and ability have aided very materially in the growth of the business. He says that they expect to do a \$35,000 to \$40,000 business this year.

The Boyson fountain caters only to the better class of people; very good prices are secured for everything, and everything is served in the daintiest possible manner. The fountain is very popular with business men and business women from the down-town district, who drop in regularly at noon to get a light luncheon with a hot or cold drink.

Mr. Kortlang says that Cedar Rapids is a good soda water town, and the people are not averse to paying good prices for good goods. They appreciate cleanliness and dainty service, and are willing to pay for it. A continual effort is made to vary the menu from time to time, so that there are always a number of palate-tempting novelties both in food and beverages.

G. H. Boyson, the proprietor, is somewhat of a busy man. He has taken an active interest in the affairs of the Iowa Pharmaceutical Association, and is president of the Ad Club, of Cedar Rapids, an organization that has done wonders in the matter of boosting the city and its industries. The Ad Club is more than an advertising club; it consists of the solid business men of the town, who show a splendid example of shoulder-to-shoulder team-work in boosting Cedar Rapids.

Fan's Flip.

Break an egg into a large glass; beat it to a froth; draw an 8-ounce grapefruit phosphate; mix the two with a tall foam.

A Few Fundamentals.

South Framingham, Mass., ranks high among towns of its size for the soda-water thirst of its citizens. Nine first-class fountains supply the thirsty with the sparkling phosphate, the creamy egg drink, and the fancy confection of the sundae group; and on a midsummer Saturday from \$400 to \$500 passes to the tills of the soda-water men. Travis & Cunningham, druggists, have been getting a goodly share of this legal tender, and expect, with their new 18-foot "iceless" and-all-improvements fountain, to make their competitors hustle to keep any of the trade.

The T. & C. soda dispensary is in charge of E. H. Shor-tiss, a veteran dispenser, who favors us with the following recital of some of the fundamentals to be borne in mind and put into practice by the dispenser who would be a top-notch:

"The soda business of the United States has grown so fast and the public taste has accepted soda so gladly—people really cannot get along without soda-water at the present time—that it seems like a dream. Men, women and children must have their different sodas or ices every day, just as they have their meals. This habit is a good one, and it will be found that there are thousands of patrons who make daily calls at the fountain for their favorite beverages. A dispenser can count on just so many every day, and he knows just what Mr. So-and-So wants and how he likes it. Oft-times patrons who have been away for a day or two will tell the soda man that they could not get good soda in some other town and that they missed their accustomed quality-soda.

"Still the soda business of this country is in its infancy. When thought is given to how it is growing and pushing ahead there must be aroused a great deal of pride, and it behooves dispensers to try very hard to help it to grow into a clean, upright business, keeping away from anything that may cast a shadow on the future.

"Mr. Dispenser, it is up to you to keep the ball rolling by being perfect in your manners, keeping your fountain clean and bright and your syrups and carbonated water up to the standard. Make the soda business your life study; try constantly to improve each beverage or ice you dispense. Make your department inviting and attractive to all. Keep your assistants supplied with clean waist coats and caps. Clean your displays and cards weekly.

"The soda-water business is naturally a clean one. Soda drinking helps many people to brace up and shake off injurious habits. The coming of the soda fountain has made it possible for thousands to pass many pleasant moments in congenial gatherings. The apparatus manufactured have provided beautiful fountains with all improvements so that the dispenser's work has become more agreeable; his working day is shorter, and he gets a better salary. It is easy to stick to it, bearing in mind that taking an interest in the business is half the battle. By reading and studying the dispenser can keep up with the 'band wagon' and please his employer and his customers."

If to attract flies is an object, leave soiled glasses on the counter—a little spilled syrup will help too. But remember that what draws flies usually has the opposite effect upon customers.

An Assorted Dozen.

Here are some hints, garnered, adapted and original:

Golden Ade.

Yolk of 1 egg; white grape syrup, 1 ounce; cracked ice and milk.

Orange Posfait.

Orange ice, 1 ounce; vanilla ice cream, 1½ ounces; whipped cream, 1 ladleful. Shake together; transfer to sundae cup; top with a strawberry and a dab of whipped cream.

Islet Sundae.

Place a slice of pineapple in an ice cream dish; put a cone of vanilla ice cream on the center of the slice; pour over all a little orgeat syrup; top with a cherry, and sprinkle over some chopped almonds.

The Soda Fountain at Newcomer's Drug Store, Toledo, Mentioned in last Month's Circular, Page 273.

Celery White Cap.

Celery syrup, ½ ounce; lemon syrup, ½ ounce; white of 1 egg; cracked ice and carbonated water.

Yamosa.

One egg; raspberry syrup, 1 ounce; ginger ale syrup, ½ ounce; cream, 1 ounce; shake with cracked ice; serve solid.

Maple Mousse.

Cook in a double boiler 1 cup of maple syrup and the yolks of 4 eggs, for twenty minutes. Stir in the white of one egg, whipped light, and remove from the fire. When cold, add 1 pint of well-whipped cream; put into an ice cream freezer, and freeze rapidly.

Sunflower Sundae.

Put a portion of chocolate ice cream in the center of a flat plate; flatten it out somewhat and arrange around the edge alternate pistachio nuts and slices of peach.

Mint Squash.

In a 12-ounce glass put blackberry syrup, ¾ ounce; lemon syrup, ½ ounce; and ginger syrup, ½ ounce. Into this squeeze the juice of 1 lime; add 2 dashes of essence

of spearmint; fill one-third full of fine ice; fill up; shake; and decorate with a sprig of fresh mint.

Bahama Belle.

Split a red banana and on top of the slices laid on a dish put a cone of vanilla ice cream; pour over this a ladleful of crushed pineapple and sprinkle with candied shredded coconut.

Cider Nog.

One egg; vanilla syrup, 1 ounce; sweet cider, enough to fill an 8-ounce glass. Shake with cracked ice.

Opera Special.

Put 3 round slices of orange on a flat dish; upon each put a small cone of ice cream—one vanilla, one strawberry and one bisque; over all pour cherry syrup and chopped maraschino cherries.

"Yes—um—deed."

Put a 2-ounce cone of orange ice in a deep sundae cup; add a tablespoonful of chopped candied ginger and 1 ounce of ginger syrup. On the side, serve ginger snaps.

A Baltimore Fountain for the Fastidious.

Although it is located in a section of the city from which there is a considerable exodus to summer resorts, the soda water department of the drug store of W. M. Fouch, at the southwest corner of Charles street and North avenue, Baltimore, is one of the busiest in that city where the soda water business is fast assuming gigantic proportions. Many of Mr. Fouch's drug-store customers are out of the city during the greater part of the heated term, but, as the corner is a transfer point for the street car lines the fountain gets a large transient trade. Attractive window signs draw attention to the various liquid delights dispensed within, and small neatly-lettered cards on the inside of the store furnish the necessary reminders to undecided customers as to the drink they desire.

The neighborhood being quite select, the management of the fountain must be in accordance. Mr. Fouch does not believe in divided responsibility, but in having a man in charge of the fountain who is thoroughly competent and capable. Upon this man devolves the responsibility for compounding the regular drinks and originating new ones. He is allowed to a large extent to follow his own methods and is held accountable for the success or failure of the fountain as a profitable adjunct to the pharmacy. Mr. Fouch believes that the management of the soda fountain is as much a specialty as the putting up of prescriptions, and that, while the former may not call for special courses of instruction, it demands experience and enthusiasm; and the dispenser must believe in the importance of his occupation and take it seriously.

As might be expected at so fashionable a stand, the sundaes and other drinks are served in dainty glasses of artistic shape, and there is a touch about the entire fountain that is in accord with the refined environment of the majority of the patrons. Popular prices are no object there. The patrons being largely of the wealthier class, they make no objection to paying well for what they want. The chief requirement is that everything shall be good. Thus the sundaes run up as high as 20 cents, all ice cream sodas are 10 cents, and only the beverages that contain nothing more than carbonated water and some syrup sell at 5 cents. Reductions in price would be rather a detriment than an advantage, since this would create an idea of cheapness, which is there carefully avoided. People do not call there for soda water because they can get it for less or because they get it in a larger glass, but because they are certain of being served with the best materials that can be obtained.

Such details as absolute cleanliness and neatness need not be mentioned; they are accepted as a matter of course. It would not be possible to build up a remunerative business without strict observance of these elementary requirements. In addition, Mr. Fouch finds that he must add a touch of daintiness and of fastidiousness, which a soda dispenser in many other places might disregard. The man in charge of the fountain must be as correct in his demeanor and as scrupulously painstaking in his manipulations as though he were always under inspection. He must be an artist in his line who can give just the right touch to the composition of a sundae, and turn out egg shakes, flips and the like with the full rich color.

Mr. Fouch does not go extensively into novelties, finding the regular list of drinks satisfying enough. A bowl of eggs is displayed always on the counter, and an appetizing

array of jars with fruits and syrups is maintained. It is by the use of such object lessons as much as anything else that he advertises his fountain. This apparatus is of a quiet, dignified design, with mahogany and cathedral glass buffet back. The cards used with the names of various drinks are not so large as to detract from the general effect. No menu cards or similar devices are used, but the dispenser always stands ready with suggestions. Prompt service, in fact, is one of the most effective means relied upon to make a favorable impression. There are no long waits at Fouch's.

During the hot soda season and in the spring chocolate easily takes first place among the flavors being called for more frequently than any other. Naturally, every detail is looked after to have the chocolate just so, for the excellence of the drink must justify the reputation of the establishment. With the advent of the warm weather, lemon phosphates have especial vogue. Vanilla is a prime favorite with the members of the fair sex, who make up a large proportion of the drinkers.

The various sundaes are quite popular in all the combinations usually to be found at soda fountains. Mr. Fouch's nut sundaes are justly famous, and he experiences no difficulty in getting 15 cents for them, when other places do well to obtain 10 cents. Mr. Fouch has never relied upon cheapness to meet the competition that has grown up around him, but has proceeded with the supposition that his patrons are willing to pay a fair or even a good price as long as they can get beverages that are in all respects satisfying. He has a very critical clientèle to deal with, and any falling off in quality would be quickly noticed.

It has been Mr. Fouch's experience that graham crackers and little cakes kept on the counter available to the customer serve to attract additional patronage. No elaborate assortment of solids is maintained, the requirements of the customers being satisfied with a few simple eatables. For most of his malted-milk-and-egg drinks Mr. Fouch gets 20 cents, and the number called for is gradually increasing.

Without any great flurry or flourish of trumpets Mr. Fouch has built up a soda-water business that pays and bids fair to pay better. He has secured this result by a steady effort to satisfy, and if possible exceed, the requirements of the most exacting customer.

A Couple New Conceits.

Betty Brown.

In a deep sundae cup put half a dozen fresh strawberries and a teaspoonful of granulated sugar; crush slightly with a spoon; pour in 2 ounces of grape juice; put on top a "32" disher of currant ice, and on top of that a "32" of vanilla ice cream.

Little Girl.

Put a ladleful of diced pineapple (no syrup) in a deep sundae cup; pour over this 1½ ounces of orange syrup; add a dash of phosphate, and turn in a "20" disher of orange ice.

Real Protection against Competition.

Meetings of American Pharmaceutical Association Branches.

Baltimore.—The Medical and Chirurgical Faculty of Maryland invited the members of the Baltimore branch of the American Pharmaceutical Association, and through them all the druggists of that city, to attend the closing session of their annual meeting on April 27th and to take part in a joint discussion of professional relations, the pure food and drug law and the anti-narcotic laws of Maryland and of Baltimore. Dr. Smith, president of the faculty, presided and the attendance of both physicians and pharmacists was large.

Dr. Wm. H. Welch, president of the American Medical Association and chairman of the State board of health, opened the meeting. He referred to the close and pleasant relations that had existed between the faculty and the pharmacists of Maryland, the establishment of the Maryland College of Pharmacy having actually been brought about by the faculty in 1841. The invaluable work of the council on pharmacy and chemistry of the American Medical Association, he said, demonstrated what could be accomplished by joint effort, and pharmacists should take great pride in the council and heartily support it, notwithstanding the criticism it had received. The board of health had started in the application of the pure food and drugs laws with two intentions: first, to secure, with the advice of pharmacists and other affected, as commissioner, the best man obtainable, and they thought they had succeeded admirably in the selection of Prof. Caspari; and second, to bring about the general observance of the provisions of the law in a reasonable time—not by drastic means, but by co-operation, education and reform. The law in general was a good one, and while some of its provisions could be improved and might even be in conflict with the judgment of the board, it was the law, and must be enforced by other than pleasant means if necessary. There are, he mentioned, new developments in medicine, particularly in modern pharmacology, in which pharmacists can and should take a prominent part. Dr. Welch expressed great sympathy with the joint meetings, to consider the mutual interests of the two professions.

Dr. Samuel T. Earle read a paper on "Professional Relations" which was enthusiastically received. Dr. Earle said that it was a subject which had been discussed until it had become trite, but was of such interest to both professions as to bear consideration. He referred to the need the physician had for the assistance of the trained pharmacist, and the equally great need the pharmacist had for the physician. This mutual dependence should bring them closer and to a realization of the proper and natural limitations of the activities of each. The lack of pharmaceutical training in the medical schools made the doctor an easy prey to the detail man, and he advised the pharmacist to counteract this by demonstrating to the doctor his willingness and ability to supply standard official preparations. He thought the physicians should and would then confine their prescriptions as much as possible to official drugs and preparations. He realized that these were ideal conditions and difficult of attainment, but not impossible with cordial co-operation. The members of both professions need to be brought together more and he hoped that other meetings of this character would be held.

Prof. Caspari thought that an extemporaneous discussion of his subject, "The Present and Future Status of the Maryland Pure Food and Drugs Law," was better than a set paper. He considered it eminently proper to discuss this law in the hall of the faculty, where it practically originated. The work of the board so far had been educational, as Dr. Welch had explained. The present law, parcelling so closely the national law, is in the main satisfactory with two exceptions. One is the permission of the sale of substandard drug products under the official name. Even if the strength be given on the label as required, this does not protect the lay user, because he does not know the official strength. In addition, it provides for unfair competition. The other weak point is the requirements that all cases be tried in the criminal court even when the violation is only technical, which causes unnecessary delay, expense and publicity. In some States provision is made for the trial for a first infraction of the law, and of unintentional or technical violations, before justices of the peace, with no delay and small expense and annoyance. While few or no prosecutions had been begun, for reasons above explained, the board had done a great deal of work in the ten months of its existence. The laboratory, of-

fice and other routine had been established. The inspectors had visited 4852 establishments, advising with the owners and explaining the law; 1242 samples had been collected and most of them examined; and 375 hearings held with the sellers of samples which had been found unsatisfactory; 274 hearings were held on one preparation, indicating that conditions were not of the best, but it was expected that the next canvass of the State would disclose great improvements. Foods had had attention, as well as drugs. No willful violation of the law in this regard had been encountered; some failures to comply with it had been found which were due to gross carelessness and ignorance. This, of course, could no longer be excused and he supposed that some convictions would have to be secured in order to bring about reform. He asked the co-operation of all physicians and pharmacists and particularly the public.

Mr. Thomas said that the anti-narcotic laws of Maryland and of Baltimore were the most beneficial legislations affecting drugs ever enacted in the State and that they were generally strictly observed by pharmacists of all branches. From his observation and from reports they were wonderfully reducing the sale and consumption of narcotics, particularly cocaine. He referred to the embarrassment sometimes caused by a request to refill a prescription for drugs which cannot be dispensed a second time on the same order. He believed that all such trouble could be obviated by the doctor, who, when writing such a prescription might inform the patient that the prescription was to be filled but once, and impressing this instruction further by making a note to this effect on the prescription itself. This provision would preclude all possibility of embarrassment.

In Mr. Swann's opinion, in order to make the law more effective and better understood, there should not be such a wide division of authority as at present.

Mr. Powell expressed the regrets of D. R. Millard, who was to speak on the State anti-narcotic law, but who was unfortunately called away, and said as a member of the pharmacy board, that this law was in the main satisfactory and that it had reduced the consumption of narcotics largely in the counties.

General discussion was then invited and Dr. Naylor said that under the provisions of the State anti-narcotic law persons who could not obtain habit-forming drugs from pharmacies except on prescription, could buy them from general stores in any quantity, and this provided for great abuses. Other physicians from the counties said that they had encountered the same conditions. Mr. Schultze explained that the board of pharmacy had wished to have this defect in the law remedied at the last session of the general assembly, but met such general opposition from the county merchants that they did not insist, fearing that this course might imperil the law as it stood. The board and pharmacists generally were in favor of limiting the sale of narcotics to drug stores, not from a pecuniary point of view, but for the public safety. Merchants in many cases were not to blame, as they did not know the evil results, and the desired control could be secured only through concerted effort to educate them and the public.

Referring to Mr. Thomas' paper, R. S. McKinney had found that by attaching to the container in which a prescription containing a specified narcotic was dispensed, a label reading "This prescription cannot be refilled except with the permission of the physician" avoided the necessity of communicating with the prescriber when a patient asked to have a prescription refilled without having secured such permission, and the exasperating delay. Mr. Thomas replied that this method had been suggested by several associations, but that he had found it objectionable since it caused the patient to often suspect that narcotics were being prescribed, thereby leading to alarm, or worse, to habit-forming.

A resolution was passed providing for a joint committee to consider the means of furthering co-operation between physicians and pharmacists and of improving the laws controlling the sale of food and drugs.

The closing meeting of the branch for the season was held at the Medical and Chirurgical Faculty hall, May 18th.

President Meyer opened with a discussion of the difficulties encountered in filling illegible and incompletely written prescriptions. His remarks, he said, must not be considered as being made in a fault-finding spirit; it was his belief that friendly and frank criticism on the part of both professions would serve to remedy these difficulties, which were mainly due to a lack of knowledge of the troubles

caused by them. Several of the members took part in this discussion, which was most instructive and interesting, and at its conclusion the chairman of the committee on professional relations was requested to arrange a meeting with the Medical and Chirurgical Faculty early during the coming fall, for a joint discussion of this subject. Dr. J. F. Hancock recalled that such a discussion was held many years ago, at which the late Prof. J. Faris Moore was the principal speaker, and thought that the contemplated repetition would be welcomed.

W. C. Powell, chairman of the Maryland Board of Pharmacy, referred to a paper presented at the March meeting of the branch by Louis Schultze, a member of the board, criticising that body and asked permission to present a letter signed by the other members of the board, giving their views, since those members did not approve the criticisms referred to. After President Meyer had explained that Mr. Millard had been asked to present at the March meeting a paper on "The Work of the Maryland Board of Pharmacy, Particularly as it Applies to the Pharmacy Law and the Anti-Narcotic Laws of Maryland and Baltimore," and that as Mr. Millard was unable to attend, Mr. Schultze was asked to present a paper on the same subject in which the criticisms were made, Mr. Powell was given unanimous permission to read the letter which was ordered to be incorporated in the minutes. This letter severely took Mr. Schultze to task for his criticisms, denying the correctness of his assertions. Mr. Schultze asked and received permission to explain that it was not his intention in his statements to produce the impression that he evidently had, and he mentioned that one magazine had actually headed his paper as "A Defense of the Maryland Board of Pharmacy." He explained that as a member of the board for the last five years, he could say that their examinations were fairly and efficiently conducted, and that in the main the whole work of the board was satisfactory. He did not approve, however, of all the board's actions, as doubtless other members did not, and he insisted that a motion had been made in a board meeting and been carried, that the proceedings of the board should be kept secret. He regretted the unpleasant outcome of his remarks and thought that they had been taken much more seriously than they were intended to be. Mr. Millard said that no such motion had ever been considered to his knowledge and he exemplified the explanation given in the letter that the only part of the board's proceedings which were secret were those referring to examinations, and this for a very good reason the board thought.

The next meeting of the branch will be held in October.

Chicago.—The last monthly meeting for the season of the Chicago branch was held at Northwestern University Building, May 16th, and was devoted to a discussion of the working formulas of some of the galenicals of the United States Pharmacopœia.

The classes of galenicals considered were collodions, oleates, oleoresins, pills, powders, troches, suppositories, plasters, and effervescing salts. Judging from the opinions expressed at the meeting many of the galenicals belonging to these classes are seldom prepared by the pharmacist. In the case of collodion, the difficulty in purchasing pyroxilin, because insurance regulations bar it from the wholesaler's stock, was cited. Opinion was divided as to the desirability of omitting working formulas in such cases. Some of the members held that the pharmacist's indifference was largely to blame, and that no fault attaches to the directions laid down in the Pharmacopœia.

Infusion of digitalis came in for considerable discussion, the most important point brought out being that pharmacists have the idea that the ten per cent. of alcohol present preserves the infusion indefinitely, and they therefore keep it made up as a stock preparation. The keeping quality of the infusion was questioned by some.

A few favored olive oil in lime liniment, and nearly all agreed that olive oil is the ideal ingredient for ammonia liniment.

It was quite generally agreed that though compound acetanilide powder is occasionally prescribed, it should be dropped from the Pharmacopœia; also that powdered fennel should be used instead of oil of fennel in compound licorice powder. It was said that the only medicated wines that appear to be at all frequently prescribed are wine of colchicum and wine of antimony.

The next regular meeting will be held in October.

Nashville.—The Nashville branch of the American Pharmaceutical Association held its regular meeting in Furman Hall, March 9th, 1911, with President J. O. Burge in the chair.

The president extended a warm welcome to quite a large number of Vanderbilt pharmacy students who were present.

Lucius P. Brown, State pure food inspector, stated that the bill amending the pure food law had been changed so that it was acceptable to the drug trade. He stated that the house bill relating to labeling the net weight and volume did not apply to medicines.

The death of two prominent pharmacists, Leo Eliel and J. LeRoy Weber, was announced, and sorrow expressed by the members.

Dr. E. A. Ruddiman then gave a very interesting and instructive lecture and demonstration showing some U. S. P. tests that can be made in a test tube. He emphasized the fact that most of the tests of the Pharmacopœia can be made with a test tube, a balance, a graduate, an evaporating dish, heat and a water bath. He began with the exudations, saying that the Pharmacopœia gave 69 tests for them, 58 of which could be made with the above mentioned apparatus. He tested acacia, showing how easy it was to detect the presence of starch, dextrin, sugar and sand. Under the official acids, there are 349 tests given, 234 or 67 per cent. of which, he said, could be made with a test tube and the other apparatus mentioned above. He tested hydrochloric acid and showed how the presence of iodides, bromides, arsenic, sulphates, sulphites and heavy metals could be detected. He then demonstrated how easy it was to tell the difference between gallic and tannic and citric and tartaric acids. Acetanilide, acetphenetidin and antipyrine were each tested and their different properties shown quite easily. A very simple U. S. P. test showing the difference between wood and grain alcohol was given. Creosote, phenol and cresol were each exhibited and their identity proven by some very simple tests. Dr. Ruddiman was given a vote of thanks.

W. R. White then addressed the branch on the subject, "Which shall come first, A Course in Pharmacy, or Practical Experience." He maintained that a course in pharmacy should be taken first; then the practical experience. He believed in theory then practice.

Mr. Burge exhibited a scrap book he had formed of facts and formulas.

New York.—The last regular session of the New York branch of the American Pharmaceutical Association was held May 8th. A somewhat greater than usual number were present, many being students from the local schools of pharmacy.

Treasurer Joseph Weinstein reported a balance on hand of \$53.59.

For the committee on education and legislation the chairman, T. P. Cook, recommended a protest against the Smith weights and measures bill at Albany. This recommendation was concurred in.

G. H. Hitchcock, of the special committee on joint meetings with physicians, reported that the final preparations for a meeting with the county medical society were in hand.

Otto Raubenheimer, chairman of the committee on the progress of pharmacy, presented a voluminous report embodying abstracts from a number of foreign journals. The report also referred to a case in Brooklyn wherein wood alcohol had been prescribed by a doctor as a sponge bathing fluid for a man. This matter occasioned considerable discussion, Mr. Weinstein stating that the practice was a common one, as was also the sale of methyl alcohol under the name "acetone alcohol" for external use on the human body. Messrs. Diner and McElhenie also spoke on the matter, and instructions were given to the branch's delegates to the meeting of the New York State Pharmaceutical Association to suggest to the latter organization the advisability of furthering legislative correction of these dangerous practices.

As delegates the branch named the following:

To the meeting of the New Jersey Pharmaceutical Association: Otto Raubenheimer, J. L. Lascoff and J. C. Gallagher.

To the meeting of the New York State Pharmaceutical Association: F. E. Niece, Hugh Craig and Joseph Weinstein.

The first speaker of the evening was F. E. Niece, who presented the subject of "Milk Analysis for the Pharma-

cist." First he outlined a scheme for the physical examination as to color, taste, viscosity, specific gravity, reaction to litmus, sediment, etc. In this connection, the lactometer, the lacto-densimeter and the pioscope were described and exhibited.

The speaker then took up the chemical analysis of milk, describing the Babcock method of fat determination, which he said he found compared closely with the Adams ether extraction method. Methods of estimating the total solids, and of calculating other constants with the slide-rule from the figures thus obtained were described in turn. The Leach method of detecting the presence of formaldehyde, and the detection of borax and boric acid with turmeric were also explained.

In considering the bacteriological examination of milk, Mr. Niece said that no test for tubercular bacilli should be considered final unless an inoculation was made. He explained quite in detail the technic of staining and counting bacteria, and told of the usual standard limitations.

J. L. Mayer followed with a lecture on the subject of "Water Analysis." After setting forth the great necessity for care and cleanliness in the operations, the speaker said that the first essential was to secure a truly representative sample of the water and to investigate the history and present condition of the source. He then described the Jackson permanent standards and their application and gave some explanations of the methods of estimating chlorides with silver nitrate, using potassium dichromate as an indicator; nitrites with a sulphanilic acid reagent; nitrates with an especially prepared phenol-disulphonic acid reagent; ammonia with a special Nessler's reagent; iron; and volatile and organic matter.

He cautioned the inexperienced against taking up the bacteriological examination of water. The details to be borne in mind in this work were emphasized, and bacteria-counting was described.

The third paper was "The Examination of Foodstuffs," by Hugh Craig. He also had a word of caution to the inexperienced, and advised those contemplating the undertaking of food examination to study the known and approved methods and experiment with them, as all methods are not equally successful in all hands. Ways of securing work from hotels, grocers, and the like were pointed out, and the apparatus necessary was enumerated.

Mr. Craig gave brief outlines of methods for the detection of artificial colors, benzoic acid, salicylic acid, saccharin and copper salts. He also described the technic of examining exhausted spices, "plumped" legumes and "loaded" condiments.

A very interesting discussion followed the reading of the papers in which Mr. De Jonge raised the point that the pharmacist would be better employed in examining his wares before seeking to get analytical work from others.

Mr. Raubenheimer thought it well for the pharmacist to get the analytical work before it was taken up by others.

About one hundred physicians and pharmacists attended a meeting of the branch with the Medical Society of the County of New York, held at the New York Academy of Medicine, May 25th. The meeting was opened by G. H. Hitchcock, chairman of the branch, and Dr. C. G. Kerley, vice-chairman of the medical society presided.

The general subject assigned for discussion at the meeting was "The Prescription." The first phase was presented by Dr. J. J. Walsh, who spoke on "Some Curiosities in Prescriptions." He began with the oldest known prescription contained on a stone at the Metropolitan Museum of Natural History and dating from the time of the Ebers papyrus and traced the progress of medicine as evidenced in the prescriptions of all epochs. In histories of ancient Rome the speaker found evidence of the same ideas in medical treatment that obtain to-day. Fresh air and assimilable nourishment in tuberculosis; cheap drugs for the poor and expensive ones for the rich, opium-and-carminatives, "pain balms," opotherapy, and many other things considered of modern origin.

Dr. Walsh told of the influence of Galen and of Valentine, both of whom taught similar doctrines, although centuries apart. Valentine's antimony treatment, he said, was the forerunner of the intestinal auto-intoxication theory of to-day; and Galen's use of the yellow oxide of arsenic in tuberculosis was but little different from the modern use of the cacodylates. In his interesting discourse the Doctor read a number of prescriptions that

were indicative of the medicine of the time each was written.

Dr. T. F. Reilly read a paper on "The Prescription from the Physician's Point of View," defining the prescription as simply an order that certain medicaments be supplied in a specified form. He believed that much misapprehension would be prevented if the prescription blank never bore the name of a pharmacist. It was his opinion that no prescription for a narcotic drug should be refilled except at the order of the prescriber. He favored having the prescription copied on the label of the medicine. While he considered the unlimited refilling of prescriptions to be unfair to the physician, he did not think it ethically wrong, believing it just as reasonable for lay persons to recommend prescribed medicines as simples or nostrums.

Dr. Reilly pointed out the risk taken by a physician endeavoring to write his prescriptions sometimes in the metric and sometimes in the apothecaries' system. He upheld the polymeric prescription "shot-gun" on the ground that the patient was usually suffering with more than one ailment and because the doctor's first care was to cure the patient. For the "elegant" proprietary he had the excuse that any medicine was better than none even though the effect were but psychic.

The speaker outlined some rules that should govern the pharmacist in his treatment of the prescription, and stated the desire of the physician to be that his prescriptions were faithfully compounded of the best drugs. He was rather inclined to doubt the integrity of the average pharmacist; and he cited the letters sent out by proprietary houses offering to acquaint physicians with cases of alleged substitution, the coal-tar synthetics trouble of a few years ago, and the recent attempt of a local newspaper to disparage the druggists as things that had led physicians to distrust pharmacists. He was of the opinion that the pharmaceutical organizations should rid the profession of the unworthy, or the medical societies would be forced to prepare a list of pharmacists worthy of the confidence of the doctors.

Hugh Craig, the next speaker, had the subject: "Some Interesting Prescriptions." The score or more examples presented by the speaker included prescriptions for the widely advertised "rheumatism cures," "kidney medicines" and "headache fizzes"; combinations of several forms of the same drugs; instances of incompatibility, intentional and otherwise, immediate and deferred; incomplete prescriptions; lengthy directions; intentional large doses; and special and code prescriptions. The various examples were commented upon as read.

The next paper was by Jacob Diner, on the subject of "Efficient Medicaments in Palatable Form." This paper is printed in full on page 293. In connection with this paper Mr. Hitchcock exhibited samples of a number of official vehicles.

Dr. G. C. Diekman, who was the next speaker, presented the subject of "The Ethical Consideration of the Prescription," taking up the various phases of the relations between prescriber and dispenser in constructing and compounding the prescription. This paper will appear in full in next month's CIRCULAR.

Doctors Kerley, Meyer, and Tannenbaum and Prof. W. C. Anderson, together with the speakers referred to above, took part in the discussion of the papers. Prof. Anderson differed with Dr. Reilly with regard to the newspaper arraignment of druggists, and forcibly pointed out the flimsy nature of the latest "exposure." He said that pharmacists, generally, were in favor of depriving the substitutor of his license; and that the tendency in pharmacy was all toward the best supporting of the physician. Dr. Kerley condemned office-dispensing by physicians, believing it to be the duty of the doctor to support the pharmacist.

After the original speakers had spoken briefly adjournment was taken.

Philadelphia.—The principal paper presented at the meeting of the Philadelphia branch of the American Pharmaceutical Association on May 2d was by Dr. H. C. Wood, Jr., the subject being, "Ethical Preparations—Methods of their Exploitation."

The attack made by Dr. Wood was along the following lines: (1) The published formulas of the mixtures are unreliable and oftentimes distorted. (2) If the formula is correctly stated at first it is likely to be changed at any time without the knowledge of the physicians who pre-

scribe it on its original merits. (3) Doctors eventually come to regard these mixtures as individual medicines. (4) It encourages self-treatment. (5) The manufacturer is usually more ignorant than the least informed country doctor. (6) The whole business, from start to finish, is rotten from the core.

Dr. Wood illustrated his arguments with pictures on a screen of some widely-known and advertised nostrums with their labels, which, it was declared, were being advocated by both doctors and druggists.

Dr. A. G. Morgan strongly supported Dr. Wood's views. He said in part:

Young doctors and country practitioners have been unjustly criticised for an evil for which they are not half so culpable as are the reputed fashionable doctors of our own city. I can take you to men who have worked in the drug stores of the district between Twentieth and Broad and between Chestnut and Spruce streets, and I can prove the truth of what I say about the physicians of that high-class section being guilty of prescribing the nostrums that we are trying to stamp out. What we need as physicians is not so much a higher education as a higher standard of morality and manhood.

The best way to get away from prescribing fake cures is for the physicians to get back to first principles and study materia medica, the National Formulary and therapeutics. If some doctors would give as much time to the study of medicines as they do to listening to high-salaried talkers employed by nostrum manufacturers to get their goods on the market it would prove a whole lot better for both doctors and patients. The evil has grown through the support given it by a certain class of physicians, and I find, too, in my own experience, that many druggists are discovered recommending this or that compound for this and that disease, when they know absolutely nothing about the ingredients of the thing they recommend.

Prof. La Wall declared that his own experience had proved not only what Dr. Morgan had said, but that the nostrum business threatened to grow to be a much greater evil unless strong measures were used to curb it. "We need education and legislation," said he, "education to elevate the doctor above prescribing these fake cures; legislation to prevent every Tom, Dick and Harry from going into the manufacture of these nostrums. A druggist has to study for years and pass the State board examination before he can put up the simplest prescription. These makers of supposed cures that come before the public with glittering names in many instances do not know the first thing about either chemistry or medicine."

In accordance with a plan agreed upon by both organizations, the meeting of the scientific section of the branch preceded that of the branch proper. Dr. I. V. S. Stanislaus, chairman of the section, presided at this meeting, at which the principal speaker was J. S. Goldbaum, Ph. D., of the department of chemistry of the University of Pennsylvania. His subject was "Methods of Electrochemical Analysis," which was illustrated in a most interesting manner with an exhibit of apparatus and its use.

Washington.—The meeting of the City of Washington branch of the American Pharmaceutical Association, held May 13th, was devoted to a visit to the drug garden at the Arlington experimental farm of the United States department of agriculture, and in many ways this meeting proved to be one of the most enjoyable and instructive of the year.

Earl C. Butterfield, the superintendent of the farm, personally conducted the preliminary trip over the farm itself and explained many of the various investigations that are being conducted by upwards of twenty divisions of the department of agriculture in what is practically a field laboratory.

One particularly interesting feature of the farm is the fact that it is being utilized as an outdoor museum of fruit trees that can be cultivated in this section of the United States. Thus the huge peach orchard of upwards of 700 trees is utilized as a check on the several available varieties of peaches, and also as a basis for experimentation for devising ways and means for combatting the diseases and insect pests to which peach trees are subject.

The same line of work is being done with apple and other fruit trees, and the fruit orchards alone are well worth seeing.

From an economic point of view probably the most important line of investigation that is now being carried on at the Arlington farm is the improvement of the several cereals that can be cultivated in this and the more northern sections of the United States. Among the grains to which particular attention was directed were a winter oats, a beardless barley and several varieties of rye. In this connection the method of conducting electroculture

experiments was also explained and the differences in the conditions prevailing in this country and in Norway, where electroculture has been practically established were commented upon.

The work done in connection with drug and perfume plants was explained by Dr. Rodney H. True, the physiologist in charge of the division of drug-plant investigation of the bureau of plant industry, and one of his assistants, Walter Van Fleet, who is directly in charge of the drug garden.

Upwards of two hundred medicinal plants are under observation, and a very large number of perfume-yielding plants are also being experimented with.

Among the well established medicinal plants that are being cultivated the members were shown: Digitalis, belladonna, hyoscyamus, convallaria, rheum, humulus, calamus, iris, colchicum, valerian, calendula, peppermint, spearmint, cannabis, conium, caraway, and fennel, all growing well and many of them in bloom.

Of American drug plants that are being experimented with the members had the pleasure of seeing hydrastis, spigelia, ginseng, podophyllum, sanguinaria, geranium, rhus glabra, collinsonia, cascara, gaultheria, cypripedium and many others growing freely in the open field or under shade quite independent of their usual surroundings.

Among the perfume plants that are being experimented with, special attention was directed to a new hybrid rose that is claimed to have an unusually long flowering period and should prove of interest as a possible source of rose water and oil of rose.

Another particularly interesting possibility is embodied in an indigenous mint, mentha citrata, which is being cultivated on quite a large scale and has been found to yield an oil that is practically identical with oil of lavender.

The economic possibilities of investigations of this kind were further emphasized by Dr. True, who pointed out that man, working in nature's laboratory, could no doubt accomplish immeasurably greater feats than have, as yet, been accomplished in the laboratory of the chemist, and that working with nature had the very great advantage of economy so far as the raw materials was concerned. As an illustration of the futility of the chemical laboratory permanently competing with nature, he pointed out the impracticability of economically producing synthetic camphor even at the present time, and asserted that turpentine, the basis of synthetic camphor, was rapidly increasing in value while camphor itself because of its wide spread cultivation would no doubt decrease in price still further.

All of the members present were loud in their praise of what they had seen and heard, and expressed themselves as being particularly grateful to Messrs. Butterfield, True and Van Fleet for the large and varied amount of information that had been given them.

Montgomery County (Pa.) Association.

The annual meeting of the Montgomery County (Pa.) Retail Druggists' Association was held at Norristown, April 13th.

An exceptionally large number of members was present, to take part in a promised discussion of legislative matters.

After a thorough discussion of the pending legislation pertaining to the drug trade—the Fahey bill and the pharmacy act—the association unanimously passed a resolution protesting against the passage of the former measure. Christopher Koch, vice-president of the Pennsylvania board of pharmacy, and president of the Philadelphia Association of Retail Druggists, was the guest of the meeting, and after he had explained the extensive amendments that had been made to the proposed pharmacy act by the legislative committee of the Pennsylvania Pharmaceutical Association earlier in the week, the association passed a resolution endorsing the pharmacy act as amended.

The election of officers resulted as follows:

President, Dr. W. H. Reed; first vice-president, M. M. Osborne; second vice-president, Dr. Theodore Jacobs; secretary, L. W. S. Jones; treasurer, Samuel N. Yeakle. Executive committee: Walter Rothwell, Frank Prickett, Harry Stallman, Thomas F. McCoy, and W. L. Harbaugh.

Prof. William Simon, for many years professor of chemistry at the Maryland College of Pharmacy, has been ill of typhoid fever. His condition is reported to be much improved, and his recovery is looked for, although he is now well advanced in years.

News of the State Associations.

June Meetings of State Associations.

ARKANSAS, 13th to 15th, at Little Rock.
 COLORADO, 20th to 22d, at Manitou.
 CONNECTICUT, 13th and 14th, at Indian Neck (Branford).
 DELAWARE, 1st, at Wilmington.
 FLORIDA, 14th and 15th, at Tampa.
 GEORGIA, 13th and 14th, at Indian Springs.
 ILLINOIS, 6th to 8th, at Rock Island.
 INDIANA, 13th to 15th, at Indianapolis.
 IOWA, 6th to 8th, at Davenport.
 MAINE, 28th to 30th, at Kineo.
 MARYLAND, 27th to 30th, at Blue Mountain House.
 MICHIGAN, 6th to 8th, at Ann Arbor.
 MISSISSIPPI, 13th and 14th, at Greenville.
 MISSOURI, 13th to 15th, at Cape Girardeau.
 NEBRASKA, 13th to 15th, at Fairbury.
 NEW HAMPSHIRE, 27th and 28th, at The Weirs.
 NEW JERSEY, 13th to 16th, at Asbury Park.
 NEW YORK, 20th to 23d, at Alexandria Bay.
 PENNSYLVANIA, 20th to 23d, at Bedford Springs.
 TEXAS, 20th to 22d, at Dallas.
 UTAH, 21st and 22d, at Ogden.
 VERMONT, 20th to 22d, at Burlington.
 WISCONSIN, 27th to 30th, at Elkhart Lake.

District of Columbia Association.

At a meeting held at Washington, April 27th, the District of Columbia Retail Druggists' Association re-affirmed its affiliation with the National Association of Retail Druggists.

The following officers were elected: President, T. H. Atkinson; vice-president, G. W. Hurlebaus; treasurer, W. A. Evans; secretary, C. J. Fuhrmann; executive committee, F. P. Weller, H. C. Easterday, A. C. Taylor, W. R. Hill, C. B. Campbell, A. N. Connor, W. H. Bradbury, S. L. Hilton, C. E. Gross, W. T. Kerfoot, and W. P. Herbst.

Alabama Association.

The thirtieth annual meeting of the Alabama Pharmaceutical Association was held Tuesday and Wednesday, May 16th and 17th, at Birmingham.

The meeting was opened at 8 p. m. Tuesday in the Chamber of Commerce auditorium, by President J. E. Roe, of Mobile, a large number of members being present.

The association was welcomed by John L. Parker, chairman of the entertainment committee, who extended the courtesies of the local pharmacists to the visiting members in his usual taking manner and assured them of the pleasure which the citizens of Birmingham would derive from their stay. The address of Mr. Parker was responded to by J. W. Durr, of Montgomery, who acknowledged the cordiality with which the members had been received. Following the response to the welcome address the chair called on C. P. Kearfott from the Virginia board, and J. J. Keane and Burton Casady, of the Indiana board, who were attending the meetings, and they responded with a few brief remarks.

On Wednesday morning routine business was disposed of and papers were read by A. C. Cain, of Decatur, and Carl Horton, of Huntsville.

At the concluding session held Wednesday afternoon officers for the ensuing year were elected, as follows:

President, W. P. Thomason, of Guntersville; first vice-president, John Adams, of Birmingham; second vice-president, E. C. Andrew, of Montgomery; treasurer, L. F. Ravonscraft, of Union Springs; secretary, W. E. Bingham, of Tuscaloosa. Members of the executive: S. A. Williams, of Troy; Frank Carrels, of Gadsden; and W. P. McDairmid, of Talladega.

Montgomery was selected as the place for the next meeting.

Much of the afternoon session was devoted to discussion of alleged violation of the pharmacy laws. Mr. Bingham, who is a member of the board of pharmacy, said that a most vigorous effort would be made to prevent the illegal sale of narcotic drugs and the practice of pharmacy by unlicensed persons. "We are tired of having these matters which are of such a grave nature dismissed by the grand juries," said Mr. Bingham, "so we have employed inspectors and legal counsel in order to put a stop to this serious offense. It is not alone in Birmingham that we find so-called druggists violating the phar-

macy laws, but all over the State, and these will be brought before the courts and prosecuted sooner or later."

The members of the association were entertained at luncheon on Tuesday afternoon by the Doster-Nottingham Drug Company, after which they were taken by trolley to see the model city of Corey. Wednesday night a banquet was given at the Hillman. John L. Parker was toastmaster; and among the speakers were: W. P. Thomason, W. E. Bingham, J. E. Roe, J. W. Durr, A. C. Lee, Terry Griel, C. P. Kearfoot, J. J. Keane and Burton Cassady.

Louisiana Association.

The twenty-ninth annual meeting of the Louisiana Pharmaceutical Association was held at New Orleans, in the rooms of the Drug Club, beginning Tuesday May 9th.

The meeting was called to order by President John E. Scott, prayer was offered by the Rev. A. R. Edbrooke, and the "freedom of the city" was given by his honor, Mayor Martin Behrman, who said, in part, "It is always a pleasure to welcome visitors, especially when they are from our own State. Our lives depend to a certain measure on the ability of the pharmacists and for that reason I have the highest regard for your association." The welcome of the Mayor was most cordial and closed with an appeal to the members to work in unison for the benefit of the State.

William M. Levy responded. He tendered the thanks of the association to the Mayor and spoke of the importance of pharmacy, claiming that more laws were needed to advance it to protect the public as well as the druggists.

The Rev. Mr. Edbrooke addressed the meeting in a happy vein, saying that he was himself an ex-pharmacist and held a certificate in England; therefore he was able to sympathize with their troubles. Accuracy was the keynote of his address, and was applied to the private life of his hearers as well as to their professional work. "There is no body of men the world can look to for more than from you," was one of the forceful statements.

Addresses were also made by F. C. Godbold, representing the American Pharmaceutical Association; by C. D. Sauvinet, of the National Association of Retail Druggists; by G. O. Bergeron, of the National Wholesale Druggists' Association; by Adam Wirth, of the New Orleans Pharmaceutical Association; by M. Stolzenthaler, of the New Orleans Drug Club; and by H. M. Rickets, of the Louisiana Retail Drug Clerks' Association.

After the addresses an informal welcome was given the delegates and F. A. Capdau then made a general response on behalf of the association.

At the second session held Wednesday morning, President Scott delivered an address. He referred to much good work that had been done in the way of enacting pharmacy laws. Among these he mentioned the regulation of traffic in insecticides, the passage by many States of anti-narcotic laws, that of Louisiana being particularly gratifying. In speaking of the successful launching of the New Orleans College of Pharmacy, he said that the organization was peculiarly interested in it for the reason that every worker for the success of that institution was an active and loyal member of the State pharmaceutical association. The Louisiana board of pharmacy, he said, was one of which the association feels justly proud, and he hoped the day was not far distant when Louisiana certificates would be recognized in every State in the union.

The address closed with appreciation of the officers who had served with him.

Reports were made by the vice-president, the treasurer, the secretary, the corresponding secretary and by various committees as follows: Executive committee, Geo. V. Claren, chairman; trade interests, R. H. Gibson, M. D.; pharmacy and queries, A. Fly; legislation, P. A. Capdau; adulteration and deterioration of drugs, Prof. J. J. Grasser; pharmaceutical education, M. T. Breslin; membership, Ed. Guste; entertainment, J. T. Baltar; memorial, G. G. Dautry; transportation, A. T. Wainwright; exhibit, W. P. Duplantier. The report of the membership committee was an interesting feature of the session. It showed a rapid growth of the association. The membership at the present time numbers 182, of whom 117 are city pharmacists and 65 country members.

After the reading of the reports an illustrated lecture was given by Dr. F. O. Northey, who took as his subject "Biological Products."

In the afternoon the association was entertained at luncheon by Sharp & Dohme.

Wednesday night the members and their friends at-

tended the commencement exercises of the New Orleans College of Pharmacy, at the Tulane theater.

Thursday was devoted to an excursion on the river, extending some thirty miles up, at which point a base ball game was played between members of the association and of the New Orleans Drug Club.

The concluding session was held on Friday. Routine business was disposed of and officers for the ensuing year were elected as follows:

President, A. di Tripani; first vice-president, W. E. Allen; second vice-president, Geo. V. Claren; treasurer, Geo. S. Brown; recording secretary, Geo. W. McDuff; corresponding secretary, F. W. Morgan (of New Orleans). Executive committee: Gus Seeman, Adam Wirth, John E. Scott, W. E. Harter and M. Stolzenhaler. The committee will select its chairman.

New York Association.

This year's session of the New York State Pharmaceutical Association will be held at the Thousand Island House, Alexandria Bay, June 20th to 23d. The committee on transportation has secured a concession from the trunk line officials so that a round-trip rate of one and three-fifths the single fare will obtain. Rooms at the headquarters' hotel will be \$3 a day for each person; with bath, \$1 a day extra.

None need here be told of the national attractiveness of the Thousand Islands, so well called the "Venice of America." Alexandria Bay is one of the most charming spots in that region of scenic beauties, and on every hand are natural pictures which never tire the eye. The local committee has planned a very enjoyable round of entertainment, in which the annual baseball game occupies a not secondary position.

Local Secretary C. N. Cook, of Alexandria Bay, will look after reservations for and otherwise take care of those telling him in advance of their intention to attend the meeting.

Pennsylvania Association.

Beautiful Bedford Springs will this year again be the meeting place of the Pennsylvania Pharmaceutical Association. The sittings of the thirty-fourth annual meeting will begin there June 20th and continue until the afternoon of the 22d. To supplement the enjoyableness of the natural surroundings the entertainment committee has arranged all the essentials for a gladsome occasion.

As usual the committee on papers and queries has been busy beforehand and under Chairman F. P. Stroup, 145 North Tenth street, Philadelphia, has compiled the following list of subjects and submitted it to the members with the request that each select a subject and notify the chairman:

1. Wanted: A satisfactory formula for making silver nitrate pills, the literature on the subject seeming quite meager.
2. Use of modern synthetics in perfuming toilet preparations.
3. To what extent should the pure food law standards permit use of methyl salicylate, benzaldehyde, anethol, cinnamaldehyde and other odoriferous synthetics in the manufacture of flavoring essences, such as those of wintergreen, bitter almonds, etc.?
4. Use of Laval and other forms of cream separators in clarifying pharmaceuticals.
5. How may the pharmacists of the smaller towns get and hold the barbers' trade for bay rum and other toilet preparations?
6. To what extent is heroine being used as a habit-forming drug?
7. Is it practicable for retail pharmacists to make physiological assays of such drugs as can only be assayed by that method?
8. May a resin of podophyllum made with acetone be properly dispensed for the U. S. P. resin, which is made with alcohol?
9. Does alcohol made from molasses conform to the U. S. P. requirements for alcohol, and may it be used in the place of grain alcohol in official preparations?
10. Many pharmacists buy their distilled water from the wholesale houses. To what extent does such distilled water meet the U. S. P. tests?
11. Wanted: A formula for a satisfactory liquid toilet soap, and ideas as to the best methods for dispensing it.
12. Wanted: Several papers on the advantages and disadvantages of indemnity insurance against suits for damages growing out of poison sales, etc.
13. Advantages which accrue from discounting all bills.
14. Salvarsan; demonstration of methods by which it may properly be prepared for use.
15. Since the dispensing physician seems to be growing more and more numerous, what is the pharmacist to do to compensate for the consequent loss of prescription business?
16. Should the retail pharmacist with a small volume of business manufacture his own fluidextracts, tinctures, elixirs, ointments, etc.?
17. Should the retail druggist give discounts on occasional

emergency orders from physicians who ordinarily buy their supplies from the physicians' supply houses?

18. How may a pharmacy be conducted successfully in a rural town?

19. What is the average length of time that steel soda fountains are serviceable? How often should such fountains be sent to the manufacturer for inspection and repairs?

20. Would it not be better to use benzoinated lard instead of petrolatum in making unguentum hydrargyri dilutum?

21. Wanted: Method for detannating wines, one that does not modify or destroy the flavor of the wine.

22. In your opinion is hypophosphorous acid really essential for the preservation of syrup of ferrous iodide? Give us your experience.

23. A comparison of kieselguhr with talc and other filtering media used, according to various editions of the U. S. P., in the preparation of aromatic waters.

24. Wanted: A perfect ointment base, one not tending to rancidity and yet readily absorbed.

25. The Sunday closing movement: is it gaining or losing in your neighborhood? To what extent?

26. Is it true that a large percentage of the adulterated essential oils on the market is due to pharmacists' demanding such products at prices below the actual cost of production of a pure article?

27. To what extent is it true that the drug clerk of to-day is either dishonest or a "dope fiend"?

28. Your clerk; is he an asset or liability; to what extent does he reflect kindnesses shown him; does it pay to allow him commissions on sales?

29. Methyl alcohol; its history, its physiological action, record of fatalities, etc. Is the chemically pure article any less poisonous than the common?

30. Unusual phenomena of precipitation or discoloration have you noted during the past year in your dispensing or manufacturing practice?

31. Which of the generally used synthetics might properly be considered as belonging among the habit-forming drugs?

32. Should registered pharmacists compound mixtures that are detrimental to health for vendors to peddle from door to door?

33. How can the retail pharmacist protect himself against the inroads made in his business, especially in small communities, by vendors of flavoring essences, toilet preparations, etc., who secure their supplies from the mail-order houses?

34. Medical practitioners may now avail themselves of post-graduate courses of instruction. Should not such courses be established for pharmacists, also?

35. Is the soliciting of clinical laboratory work (such as urinalysis, examination of sputum, etc.) from the public, properly within the province of the pharmacist?

36. To what extent should a regular course of lectures in pharmaceutical ethics be made a part of the curriculum of our colleges of pharmacy?

37. Wanted: A table showing the advance in cost of drugs and chemicals directly due to the operation of the federal food and drugs act.

38. Would it be practical for a number of pharmacists in a given locality to co-operate in establishing and maintaining a well equipped scientific laboratory for making and standardizing assayable preparations, and also for analytical, bacteriological and clinical analysis for physicians?

39. Wanted: Several papers on current pharmaceutical legislation.

40. Is it true, as has been stated by one observer, that beet sugar is sweeter than cane sugar, and that, while cane sugar may readily be powdered fine enough to pass through a No. 80 sieve, beet sugar can not? Why?

41. To what extent is the pharmacist's personality a business asset?

42. What benefits are derived by the country pharmacist from membership in his State Association?

43. Is the practice of pharmacy being restricted too much by national and State laws?

44. What penalties should be meted out to the substitutor?

45. Is anything permanently gained by Sunday selling from soda fountains?

46. To what extent dare general or other stores employing no registered pharmacist fill orders for family receipts, etc.?

47. An employer's experiences with clerks, serious and humorous.

48. A clerk's experiences with employers, serious and humorous.

49. The bright side of life behind the counter.

50. Why should labels under which drugs are sold that are not of official standard strength carry a statement of how they differ from the U. S. P. or N. F. standard or formula?

51. What is the best method of ascertaining the amount of knowledge a college student has absorbed?

52. Is it not about time for schools of pharmacy to discontinue the conferring of degrees and issue in lieu thereof a certificate of instruction received?

53. Is it feasible to form an arrangement by which physicians would discontinue dispensing and pharmacists cease recommending medicinal remedies?

54. Would it not enhance both pharmacy and medicine if physicians ceased dispensing, and the manufacture and sale of proprietary medicines were prohibited?

55. Ethyl alcohol of superior purity is produced from phytolephas macrocarpa (corozo nuts or vegetable ivory). To what extent is this industry carried on in this State?

56. Could the so-called "blue law" of Pennsylvania be so amended as to eliminate its absurdities, yet not result in bringing about that condition best described as "the Continental Sabbath"?

57. When formulas are identical, can it be considered substitution to dispense "A. B. & Co.," when Y. Z. & Co. is specified?

58. Is there a legitimate demand for essence of pepsin of a lower digestive power than the official preparation?

59. Does the general public appreciate why it should patronize pharmacists in return for the manifold benefits it enjoys as the result of unselfish efforts put forth by pharmacists to pro-

teer it from incompetents, impostors, adulterators and exploiters? If not, what means can you suggest whereby the public may be interested in the claims of the pharmacists for preferential consideration in commercial transactions? (Submitted by the chairman of the commercial section of the American Pharmaceutical Association in accordance with a provision of the A. Ph. A. by-laws, chapter X, article 2, which requires the submission of a question to each State association for discussion at its annual meeting.)

Meeting of the Trustees of the Pharmacopœial Convention.

The annual meeting of the trustees of the United States Pharmacopœial Convention was held at the office of Prof. Remington, May 5th and 6th, all the members being present.

Probably the most interesting report presented was that of the sub-committee on scope. It was stated that the committee had practically completed its work, and that the executive committee would within a few days receive the full list of drugs, chemicals and preparations it proposed for admission to the new Pharmacopœia. This committee presented a preparatory list six months ago of the preparations which all agreed should be admitted.

The board appropriated funds for use in paying necessary expenses in the work of revision incurred by members of the executive committee.

It decided to withdraw from sale those copies of the Pharmacopœia in which additions and corrections have not been incorporated in the text.

It was reported that an inventory had been prepared of all of the articles of permanent value purchased since 1900. A record is being made of the location and condition of these articles. Insurance had been taken out on the electroplates for both the Spanish and English editions of the Pharmacopœia which are in the hands of the publisher; also, on the copies of both the English and Spanish editions of the book which are on sale in the hands of agents.

An auditing committee examined the accounts of the treasurer, Samuel L. Hilton, and of the secretary, Dr. H. M. Whelpley and found the same correct. The following is a summary of the same for the fiscal year ended April 30th:

RECEIPTS.		
Balance from treasurer, 1900-1910.....	\$8,394.01	
Sales, English edition.....	6,188.02	
Sales, Spanish edition.....	1,169.35	
Receipts from use of text.....	290.00	
Interest on deposit.....	171.93	
	\$16,213.31	
EXPENDITURES.		
Convention 1910.		
Supplies	\$79.70	
Printing	53.25	
General	15.73	
Stereographic report.....	375.38	
Clerical	198.00	
Abstract	345.17	
	\$1,067.23	
Revision.		
Clerical	\$1,847.50	
Meetings	13.89	
Supplies	1,140.97	
Postage and telegrams.....	146.88	
Experts	52.60	
General	112.67	
	\$3,314.51	
Publication and Sales.		
English edition.....	\$1,958.56	
Spanish edition.....	271.12	
General	9.00	
	\$2,232.68	
Administration.		
Meetings	\$330.10	
Clerical	666.00	
Supplies	154.65	
Postage and telegrams.....	67.50	
General	41.53	
	\$1,259.78	
Cash on hand.....	8,339.11	
	\$16,213.31	

The members of the board of trustees, as constituted by the convention of May, 1910, are:

James H. Beal, Henry M. Whelpley, Frederick W. Meissner, Jr., William Jay Schieffelin, and George H. Simmons. Joseph P. Remington and Harvey W. Wiley are ex-officio members.

Misfortune met two travelers, and swelled to twice his size; one, cowering, groaned, "Alas, this hour!" and fell, no more to rise. The other climbed the ugly shape, saying, "It's well you came!" And made misfortune serve him as a stepping stone to fame.—A waif.

Patents on Suprarenal Active Principle Upheld.

In a final hearing on the validity and alleged infringement of the Takamine patents on glandular extractive products in the action brought by Parke, Davis & Co., of Detroit, against the H. K. Mulford Company, of Philadelphia, Justice Hand of the United States circuit court for the Southern District of New York, found for the complainant on nine of the sixteen claims in the patent specifications in question, in one cause of action, and on four of the eight claims in the other cause. Not all of the claims of either patent were in issue. The case had to do with adrenalin and adrin,—products of the complainant and defendant, respectively. The powder or dry form of the suprarenal active principle and the commercial solutions of the borate of the principle with preservatives were both in question and the court ruled that with regard to both forms there was an infringement.

It was contended that the product made under the patent did not comply with the specifications in regard to freedom from "inert and associated gland tissue," but the court held that the other substances present were not "inert and associated gland tissue."

The court was of the opinion that the presence of organic impurities did not differentiate two products. In this connection the court also considered the melting points of both products and interpreted the phraseology of the specifications so as to preclude a claim for material difference being based on a slight difference between the two melting points. And it was held that the similarity of the processes being considered together with the practical uses of each substance, and the approximation of result physiologically, the two were near enough to be an infringement one of the other.

With reference to solutions of the active principle, the court held that the patent covering these products embraced solutions in general without any regard to their stability or the presence of preservatives.

In the matter of alleged anticipating inventions invalidating the patent, the court called attention to the fact that the active principle per se was not the patented product. He also showed that the phraseology of the specifications could not be interpreted to cover the product of the processes of the same patents referred to specifically as such. The claims, said the court, did not cover the salt of the principle, but rather excluded such, and the alleged anticipating products had never existed except in the form of a salt.

With regard to the prior use of the substances patented, although not in the form of the active principle, but as a component of the glandular substance, the court was of the opinion that the difficulties of the old products was such a handicap to their use therapeutically that the improvement afforded by the isolation of the active principle made its discovery novel.

It was held that the claims of the patent, although broad, were not vague and did not embrace fraudulent reduplication. Such claims, in the court's opinion, should be as broad as possible without including particulars that were not to be covered by the patent. In summing up the court ruled that if any one of the specified differentia of the claims was missing in the defendant's product, the latter did not infringe, and that if any of the alleged anticipating products included all the differentia the claim to the patent was invalid. In his opinion the evidence did not warrant the conclusion that these foregoing surmises were correct.

The case has been appealed.

Manufacturing Perfumers' Association.

The seventeenth annual meeting of the Manufacturing Perfumers' Association was held at the Drug and Chemical Club, this city, April 18th to 20th. There was a large attendance of members, active and associate.

The president of the association, Frank B. Marsh, of this city, presided. Among the recommendations of an address made by him was one looking to the formation of a library of books relating to the history and manufacture of perfumes which might be placed in charge of some public library; another proposed the establishment of a museum of perfume materials.

The report of the secretary, Edwin Ross, showed that the total membership at the time of the meeting was 111, made up as follows: Active, 30; associate, 78; honorary, 3.

The report of the treasurer, A. B. Calisher, gave in detail the financial transactions of the association for the

year ended April 18th. The receipts were \$2,909.88 and the expenses \$2,371.02. The association has a surplus fund of \$3,982.13.

Papers were read on "The Regulation of Express Companies," by Frederick B. de Berard; on "Saving the Worthy Debtor," by George H. Williams; on "Some Practical Results Obtained by Scientific Management," by James Newton Gunn; and on "Our Commercial Interest in Latin America," by Prof. William R. Shepherd.

Officers were elected for the ensuing year as follows:

President, Frank B. Marsh, of New York; first vice-president, William A. Bradley, of New York; second vice-president, S. S. West, of Cleveland; secretary, A. D. Henderson, of New York; treasurer, A. B. Calisher, of New York; executive board, Theodore Ricksecker, F. M. Carpenter, D. H. McConnell, J. Clifton Buck, A. M. Spiehler, and James E. Davis.

Meeting of the Proprietary Association.

May 24th to 26th the Proprietary Association of America held its twenty-ninth annual convention at the Hotel Astor, in this city. The attendance was larger than at any previous meeting for several years back and as usual at most of the sittings was limited to members only.

It has been the custom of the association not to print reports of its proceedings and the question as to whether or not the proceedings of the meeting just held will be printed was referred to the executive committee with power to decide. In an address which lasted some three hours G. L. Douglass, counsel of the association, outlined his work for the association.

The election of officers resulted as follows: President, F. J. Cheney, of Toledo, O.; vice-presidents, A. H. Beardsley, of Elkhart, Ind., and W. H. Gove, of Lynn, Mass.; secretary and treasurer, O. C. Pinckney, of New York; executive committee, J. F. Hinds, of Baltimore, Md.; R. R. Land, of Binghamton, N. Y.; D. M. Newbro, of Detroit, Mich.; J. A. Patten, of Chattanooga, Tenn.; Dr. J. B. McFatrach, of Chicago, Ill.; W. E. Weiss, of Wheeling, W. Va.; and V. M. Pierce, of Buffalo, N. Y.

New York German Apothecaries' Society.

A well-attended meeting of the New York German Apothecaries' Society was held May 4th, President Kleinau in the chair.

Mr. Roller, chairman of the scientific committee, reported on the last scientific social evening, stating that 130 persons were present. He announced that Dr. G. Drobegg, who had intended to speak on "Electrolysis," was prevented from being present. Mr. Roller suggested that in place of a lecture the members discuss interesting cases in pharmaceutical practice, mentioning several subjects which he thought worthy of treatment. He asked the members to come prepared for such a discussion at the next meeting.

Dr. von Oefele then entertained the members with an account of many interesting facts, partly from his own experience.

Mr. Swan, chairman of the legislative committee, reported on the bills at present before the legislature which are of interest to pharmacists.

He asked members not to push any preparations which are prepared by firms in which physicians are pecuniarily interested.

Mr. Gilbert, chairman of the entertainment committee, reported on the arrangements of the trip to College Point on July 6th.

President Kleinau told the members of the death of Mr. B. G. Amend, and asked the members to honor their fellow-member for many years by rising from their seats.

After the president had greeted the new members who for the first time attended a meeting, and had announced that eight candidates had been elected and seven proposed, the meeting adjourned.

Many members of the society, some accompanied by their wives, made a visit on May 17th and 18th to the laboratories of Sharp & Dohme at Baltimore. The visit was the outcome of an invitation which Dr. A. R. L. Dohme had extended to the members some years ago while lecturing before the society. The party was welcomed by Dr. Dohme, the vice-president, Mr. Sailer, the general manager, and several employees of the firm, and conveyed in special cars to the Hotel Caswell, where accommodations for the visitors had been provided. After supper the party

enjoyed a performance at the Maryland Theatre. The following morning the laboratories were visited. At noon the visitors were taken on a sight-seeing tour in automobiles through the city, the parks and adjoining suburbs and many places of interest were pointed out. At three o'clock a dinner was given them at the Baltimore Country Club, and then the well-known German "gemüthlichkeit" came to the front. Mr. Gilbert acted as toastmaster, the speakers of the evening being President Kleinau, Dr. Dohme, ex-President Hirseman, Dr. Alpers, Mr. Hynson and others.

The number of guests was more than 200.

New York Retail Druggists' Association.

The New York Retail Druggists' Association met on April 28th, at Westminster Hall. The meeting was well attended. Two new members, Paul J. Gillman and Alexander Krakower were added to the list.

A communication from Mr. Cook for the New York State Pharmaceutical Association in regard to the expenditures on entertainment during the coming convention was read and action on it was forthwith taken by passing a resolution to contribute \$50 for that purpose. A letter was read in which notice was given that the meeting of the association would take place June 20th to 23d, sooner than the date originally set.

Mr. Healy, representing Mulford & Co., was granted the privilege of the floor and explained fully how it happened that his house became involved in the *World* "exposure."

A paper was read by J. L. Lascoff entitled "A Comparative Resumé of the Different National Pharmacopœias," and twelve copies of the various Pharmacopœias, some in their original language, others in translation, were brought to the meeting for the inspection of the members. The author dwelt on the fact that some well known remedies adopted by some Pharmacopœias are not given recognition by the others; that some galenicals, the worth of which is never denied, and which are very often prescribed, are not found in all the books. He noted the special rules given by the Russian Pharmacopœia for keeping poisons under lock and key, and how the law required the prescribing physician to place an exclamation mark after the dose if such be above the maximal according to the table annexed to the book. The main object of the author was to advise the pharmacists who are practicing in a cosmopolitan city to familiarize themselves with the foreign Pharmacopœias, since prescriptions from doctors who are graduates from abroad and who adhere to their respective home Pharmacopœias are coming into the stores very often and, in order to fill their prescriptions correctly, the nature of such foreign preparations must be learned by the pharmacists.

Mr. Lascoff was given the thanks of the association, and in the discussion that followed many members participated.

Dr. Joseph Weinstein then began to talk on the pharmacy law, and his contention that in face of the multitude of laws that surround the pharmacist he may at times become puzzled and be in error as to what he may and what he may not do, was proven true when he began asking questions on the rights of the junior clerk in the absence of the registered man, and on the subject of registration of poisons. In replying to each and every question the opinions were divided, thus illustrating that many a point in the pharmacy law wants an elucidation, and this Dr. Weinstein started to give in a masterly way. But as the hour was late the continuation of the subject was postponed for a future meeting.

J. J. Stephenson, 1880 Lexington avenue, this city, was the victim of a bit of highway robbery recently, losing \$25.

Early in March burglars visited the store of John Coleman, of Wheeling, W. Va., an ex-treasurer of the National Association of Retail Druggists, and took away with them about \$35 in cash and fountain pens, Havana cigars, silver-mounted pipes, high-grade toilet soap, and other fastidiously selected merchandise to the value of \$50.

Statistics given in the calendar of the Pharmaceutical Society of Ireland for the current year show that at the end of 1910 there were 860 pharmaceutical chemists qualified to practice in the Emerald Isle, as compared with 825 a year previously, 186 chemists and druggists, against 190; 567 registered druggists, against 555; and 129 assistants to pharmaceutical chemists, against 122.

A Proposed International Federation of Pharmaceutical Associations.

At the International Congress of Pharmacy held at Brussels last September a movement was initiated for forming an international federation of pharmaceutical associations. The Dutch Pharmaceutical Society was the prime mover in the matter, we are told, and provisional headquarters for the proposed federation have been established at The Hague.

What the federation should undertake to do is set forth in a series of draft propositions which have been published, which propositions follow:

1. Collecting data with regard to the practice of pharmacy in all countries.
 2. Studying the laws regulating the pharmaceutical profession.
 3. Giving advice and supplying data with regard to the laws relating to pharmacy.
 4. Organizing international pharmaceutical congresses.
 5. Filing the papers of these international congresses, arranging and working out of the subjects treated there, and studying fresh subjects for treatment.
 6. Making arrangements for participation in congresses of interest to pharmacy, and by collaboration with other international societies.
 7. Promoting uniformity in the formulation of requirements for education and tuition.
 8. Protecting the rights of the pharmaceutical profession.
 9. Working against the practice of pharmacy and the sale of medicines by unqualified persons.
 10. Promoting the prosperity of the national pharmaceutical societies.
 11. Promoting uniformity in the form of medicines and methods of investigation.
 12. Doing all other things that may be considered conducive to the attainment of the object of the federation.
- The office of the Secrétariat Général is at 4 Schenkweg, The Hague.

The Right of Privacy.

In a decision handed down May 1st the United States Supreme Court upheld the constitutionality of the New York statute which forbids any one to use a person's photograph for advertising purposes or in any other way to exhibit it publicly without the consent of the person represented. This decision was given in the case of a Brooklyn woman against the Speery & Hutchinson Company. Suit was brought alleging that the company had displayed a photograph of the complainant in one of its store windows in Brooklyn without the complainant's knowledge and consent.

The complainant was awarded damages of \$1,000 in the local court, and later the Appellate Division and the Court of Appeals of this State confirmed the lower court's verdict. This case has been in the courts since the fall of 1905, and its progress has been attended with a great deal of interest.

New Interstate Habit-Forming Drug Bill.

Mr. Mann has introduced in the United States house of representatives a bill "to regulate the transportation of habit-forming drugs in interstate and foreign commerce." The text follows:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the term "interstate commerce" as used in this act shall include transportation by freight, express, mail or in any other manner between a place in any State, Territory or District of the United States, or place non-contiguous to but subject to the jurisdiction thereof, and a place in any other State, Territory or District of the United States, or place non-contiguous to but subject to the jurisdiction thereof, and the term "foreign commerce" as used in this act shall include transportation by freight, express, mail or in any other manner between a place in a foreign country and a place within or subject to the jurisdiction of the United States.

Sec. 2. That hereafter it shall be unlawful for any person to knowingly send or receive, directly or indirectly, himself or by servant, employee, agent, officer or otherwise, any opium, morphia, coca leaves, cocaine, alpha and beta eucaine, choral, cannabis or any derivative or preparation of any of them, in interstate or foreign commerce, except in accordance with the provisions of this act, and unless such person shall in every respect comply with the provisions of this act.

Sec. 3. That it shall be unlawful for any person to send or receive in interstate or foreign commerce any of the articles described or referred to in section 2 of this act, unless such

person shall keep a complete list of all shipments and receipts of such articles by such person in interstate and foreign commerce, which list shall furnish an accurate description of the article received or sent in interstate or foreign commerce, together with the quantity thereof and the name and address of the person from whom received or to whom sent, and which list shall be kept in such manner and form as shall be prescribed by the secretary of agriculture, and shall at all times be open to inspection by any United States or State employee designated for such purpose by the secretary of agriculture.

Sec. 4. That it shall be unlawful for any person to send or cause to be sent, either directly or indirectly, himself or by servant, employee, agent, officer or otherwise, any of the articles described or referred to in section 2 of this act, to any person other than a qualified practicing physician, dentist or veterinarian, a regular and legitimate manufacturer of or jobber or wholesale or retail dealer in drugs, or a hospital, college, scientific or public institution.

Sec. 5. That any person violating any of the provisions of this act shall for each offense be fined not exceeding \$1,000, or imprisoned not more than one year, or both.

Sec. 6. That nothing in this act shall be construed to repeal or affect any of the provisions of the act entitled "An act for preventing the manufacture, sale or transportation of adulterated or misbranded or poisonous or deleterious foods, drugs, medicines and liquors, and for regulating traffic therein, and for other purposes," approved June 29th, 1906.

The bill was referred to the committee on interstate and foreign commerce.

College Commencements.

Atlanta College.

Commencement exercises of the Atlanta College of Pharmacy were held in the Orpheum Theater, March 27th. The salutatory was made by William Ernest Sawyer, and the valedictory given by Thomas Henry Lander.

The degree of graduate in pharmacy was conferred on: A. G. Arapian, T. E. Anderson, J. L. Aven, C. J. Bible, C. A. Bynum, J. F. Beasley, J. T. Castleberry, G. A. Currie, J. E. Eaves, Max Freedman, J. V. Frederick, J. P. Grimes, Jay Gore, C. V. Gibson, James Hamilton, R. E. Howard, O. L. Hiett, C. Hixon, I. D. Houtz, R. M. Harper, O. E. Jordan, C. R. Jenkins, C. E. Liles, T. H. Lander, S. K. Lowry, T. E. Lowman, D. G. Mahon, Miss Clayton Mikell, V. H. Marechal, J. J. Moreing, H. T. Nelms, B. J. Parrish, H. J. Porter, J. G. Rawls, G. D. Sayle, A. C. Sawyer, W. E. Sawyer, C. D. Tedder, W. C. Touchton, O. G. Turner, C. K. Wheeler, and W. L. White.

The degree of pharmaceutical chemist was granted to: O. L. Hiett, James Hamilton, and R. F. Hixon.

Brooklyn College.

The exercises marking the twentieth commencement of the Brooklyn College of Pharmacy were held in the Baptist Temple, Thursday evening, May 11th.

The exercises were opened with prayer by the Rev. John Williams; an address was made by the Rev. Newell Dwight Hillis, D. D., prizes were awarded by first vice-president Clarence O. Douden (President Rehffuss being unavoidably absent); Prof. William C. Anderson, dean of the college, described the conditions of graduation; Prof. Percival Lohness read the list of graduates; and the valedictory was delivered by George M. Perry.

The degree of graduate in pharmacy was conferred upon the following candidates: Mario M. Abbene, Hyman Axelrod, Nathan Bachwitt, Adam S. Baczynski, Jacob Belkowitz, Theodore Blackman, Israel Bromberg, Samuel N. Burger, Joseph Bushel, Frank Carena, Michael Carlo, Carmine Cava, Walter C. Currey, Raymond De Angelis, B. Escover, Abraham Feinstein, Samuel Feiterson, Jacob Feldman, Harry Fried, Abraham Friedman, Benjamin Friedman, Leon Friedman, Julius Geiger, Charles L. Gesell, Jr., Nettie Giventer, Jacob W. Goldberg, Louis Goldberg, Nathaniel J. Goldberg, Jacob Greenberg, Max Goldsmith, Abraham Hoch, Maurice Horowitz, Joseph Itkind, Thomas G. Jaffe, Max Kalmanow, David Kaplan, Mordochy Kimmel, Morris Klein, Alexander Krone, Sebastian Karp, Solomon Lauter, Lemuel M. Lemelson, Ida Lesser, Joseph Lavitt, Hyman Levy, Morris Levy, Jennie Loeb, Abraham Lush, Harry Lessinger, William R. Markham, Samuel L. Mahl, Amelia L. Monaco, Guilio Marvello, Morris Moskowitz, Jacob Madoolman, Samuel Neham, Samuel Nirenblatt, Albert Ostroff, Harry Pachter, David Picker, George M. Perry, Benedict F. Pelonsky, Olga Praisner, Benjamin Promisloff, Samuel Rabinowitz, Benjamin Rappaport, Lucelle Rein, Benjamin Robins, Nathan Rogin, Leonard Rose, Moe Rosenbaum, Louis Rothenberg, Philip Rothenberg, Morris Rothstein, Donato Rossi, Samuel Saletan, David Saltz, Mary Schenck, Charles Shaitless, David Sheftelman, Rose Shuloff, Benjamin Siegel, Boris Schwartzman, Louis

Steinberg, Samuel Storch, Nathaniel Sternig, Samuel Strauss, Samuel Trager, Israel S. Turk, Frank Wallach, John Weinmann, Jr.; Benjamin J. Weiner, Morris R. Willner, William Wolf, Alexander Zeiger, George Zuckerman and Harry Zwilling.

The degree of doctor in pharmacy was granted to Harold T. Cartwright, Henry M. Giesselman, Jr.; Walter M. Hahn, Joseph R. Marino, Barnet Rosenhouse, Monroe H. Weil, and Samuel Wolf.

Prizes were awarded as follows: Senior gold medal, Samuel Saletan; senior silver medal, Israel Bromberg; senior bronze medal, Samuel Feiterson; Anderson pharmacy medal, Jennie Loeb; alumni microscope prize to Mordoochy Kimmel; post graduate gold medal, Samuel Wolf; junior silver medal, George A. Roscoe.

Chicago College.

The fifty-first commencement exercises of the University of Illinois school of Pharmacy (Chicago College of Pharmacy), were held at the Y. M. C. A. Central Auditorium, Chicago, Thursday afternoon, April 27th.

The principal address was made by Thomas H. Potts, secretary of the N. A. R. D. The class speakers were Thomas Ross, salutatorian, and George S. Churchhill, valedictorian.

President James conferred the degree of graduate in pharmacy upon the following:

Adolph Emil Anderson, Edwin John Backus, Carl F. Bode, Clifford Jerome Bower, Matthew Virgil Boutte, Bert Douglas Burley, George S. Churchill, Ben Lee Eicher, Anton William Fingl, Edgar Andrew Flynn, George Edward Franke, Lloyd Goveia, Edward Daniel Griffin, Edward Joseph Halfacre, Herbert Henry Heidebreder, Bernard James Hourigan, Ernest Theodore Jann, James Charles Keefrey, Reuben Leonard Lindstrom, Oscar John Machenheimer, Erwin Joseph Mark, Thompson Alexander Nooner, Michael Adalbert Pokorney, Rollo Bielby Sarginson, Benjamin Samuel Schildbarg, Charles George Schreiber, Edwin Joseph Setz, Harry Albert Sieben, William Adolphus Smith, Lou Archibald Watson, Harry Arthur White, Otto J. B. Wruck, John William Zellinger, Charles Patt Eck, Joseph Alfred Merrill, Clarence Oberg, Felix James Ratajik, Ruth-erford Gustavus Rosenstone, Charles Kraus Stulik, John Berger Anderson, Arthur Frederick Bagge, Roy Ernest Baker, Rush Arthur Brown, Arthur C. Corbin, William Arthur Herrick, Samuel May Hottar, Albert Philip Niemeyer, Henry Onno Peters, Warner Edmund Purcell.

Certificates were given the following: Stanley Clarke, Joseph Francis Hrejsa, Paul McCulloch Kepner, Orval Wilkie Lee, Chester Logan, Ernest Elmer Montgomery, Thomas Ross, William Sylvester White.

The prizes were awarded as follows: The Becker Prize, to Thomas Ross; the Biroth prize to L. A. Watson; A. Ph. A. membership to Reuben L. Lindstrom, B. S. Schildberg and Anton W. Fingl. Honorable mention for excellence in scholarship to A. E. Anderson and J. C. Keefrey.

Louisville College.

The commencement exercises of the Louisville College of Pharmacy were held at the Masonic Theater, Friday afternoon, May 21st.

The following candidates were graduated: Carl William Bader, James Edward Bass, Frank Moffett Brown, Joseph Adolphus Brown, Clarence D. Cunningham, James Baxter Frank, John E. Howley, Ralph Edward Julian, Anna Edmonia Keller, Franklin Stith Kinchloe, Harry Martin Merriman, Wilbur W. Morris, Benjamin Franklin, Frank Jacob Schweitzer, Jr.; Jesse Andrew Shaver, Harry Francis Pesel, Thomas P. Taylor, Jr.; and Paris L. Thomas.

New Jersey College.

Graduation exercises for the class of 1911 for the New Jersey College of Pharmacy were held in Krueger Auditorium, Tuesday evening, May 9th. An address to the graduates was made by Dr. Harvey W. Wiley. The awarding of diplomas was made by A. B. Poland, superintendent of public schools; and W. O. Kuebler, president of the college, read the roll of honor.

The members of the graduating class were: A. Bernardinelli, Paul D. Bloom, Rudolph Preitenfeld, Joseph E. Connolly, O. C. Hayes, Alfred Maier, Raphael Silber, Claude Van De Mark, Frank Walkenberg and Theodore Westerman, all of Newark; Morris H. Albach, of Elizabeth; W. G. Beucier, of Fort Lee; Emil Cataldi, of Orange; H. L. Debus, of Jersey City; Alexander Effros, of Paterson; Carl

Hoffmann, of Hoboken; Miss Helen Gluckman, of Jersey City; William J. Jordan, of Jersey City; Mortimer Kobelinsky, of Brooklyn; William G. Kroemmelbein, of Elizabeth; Richard Linehan, of Bloomfield; John T. Roe, of Paterson; Herman Strauss, of Elizabeth; Fred K. Thile, of West Hoboken; John Warzkiewicz, of Bloomfield; Joseph Weisberger, of New York city.

New Orleans College.

The annual commencement exercises of the New Orleans College of Pharmacy were held at the Tulane University Wednesday evening, May 10th.

The address to the class was made by James W. Porch, and the valedictory given by J. J. Gerache.

A. K. Lindsey received the alumni medal; E. J. Feahney, the faculty medal; and Thomas Cronan, of the junior class, the medal of the Louisiana Pharmaceutical Association.

The list of graduates follows: R. V. Armstrong, Herman H. Bierhorst, Andrew H. Bowmann, George V. Claren, Jr., Corrie C. Chapman, John R. Cooper, John E. Dixon, Juan Donestrevéz, Edward J. Feahney, Joseph J. Gerache, Jr., Max Graff, Oliver J. Hebert, Ashton R. Holloway, E. C. Kinder, Thomas I. K. Keoun, Lewis E. Koffskey, John B. Lavigne, Jr., A. Kent Lindsay, P. B. Manouvrier, Paul C. Mouton, Paulin J. Poche, C. E. Rielly, George A. Rojas, J. B. G. Canarens, Paul M. Schertz, Douglas V. Stuart, Hunter M. Todd, Segundo Toyas, Clarence J. Wichser, Lurline A. Wilson, William M. Windham and Guy L. Leefe.

New York College.

The eighty-first annual commencement exercises of the College of Pharmacy of the City of New York were held May 11th in Carnegie Hall. Vice-president C. F. Chandler conferred the degrees.

The alumni prizes were awarded by Dr. L. W. Geisler and the trustees' special prizes by Dean H. H. Rusby. The address to the graduating class was delivered by Dr. H. L. Taylor, of the department of education of New York State. C. W. Dunn addressed the class as valedictorian.

Prizes were awarded as follows: To E. D. Brooker, gold medal; Morris Arginteanu, silver medal; H. M. Dichter, bronze medal. Trustees' special prizes were given to Morris Arginteanu, H. M. Dichter and Frank Sansonne. On the roll of honor were Morris Arginteanu, Matthew Blair, J. T. Bongartz, F. J. Brannigan, E. D. Brookes, H. M. Dichter, C. W. Dunn, Samuel Fritz, John Garb, Isidor Kipuis, Samuel Klempner, Arthur Machol and Frank Sansonne.

The graduates in pharmacy were: S. A. Applebaum, Morris Arginteanu, Marion Astarita, Harry Balloff, B. H. Berning, Matthew Blair, Louis Breinin, E. D. Brookes, B. F. Charles, M. M. Cashan, R. L. Conklin, L. P. Costa, Solomon Domovsky, Samuel Dreyer, C. M. Driesen, Robert Filice, Samuel Finegold, Jacob Friedland, Samuel Fritz, John Garb, Jacob Goldberg, Solomon Greenbaum, Rose E. Greines, H. L. Hermes, Morris Kalish, J. V. Keyrouse, Isidor Kipuis, Samuel Klempner, Paul Taccorn, Philip Lacovara, C. E. La Gambina, F. W. Langen, Solomon Leder, Lillian Leiterman, Alexander Lichtner, Nicholas Lombardi, J. J. Loughlin, Arthur Machol, Giocchino Madonna, R. J. Melamade, J. D. Miller, Jacob Morgulis, Solomon Morris, Vincent Pica, Meyer Picker, Hyman Relin, A. A. Romano, Frank Sansonne, Israel Schwartz, J. J. Slofkin, Maurice Stein and W. E. Warner, all of New York.

George Alliton and J. T. Bongartz, both of Kingston; Samuel Bearman, of Hoboken, N. J.; E. H. Berry, of Malone; F. J. Brannigan, of Ware, Mass.; Louis Caggiano, of Utica; J. V. Cariffe, of Tuxedo Park; J. J. Cassidy, of Port Perry, Ont., Canada; F. D. Coleman, of Dover, N. J.; M. P. Cote, of Baltic, Conn.; H. M. Dichter, of Brooklyn; G. W. Dickie, of Morristown, N. J.; W. I. Dillingham, of Bernick, Me.; Frank Donohue, of Turners Falls, Mass.; W. H. Doolittle, of Far Rockaway; C. W. Dunn, of Jersey City, N. J.; L. H. Fried, of College Point, L. I.; Harold Goldstein, of Brooklyn; C. D. Hakes, of Orange, N. J.; B. A. Hamelin, of Champlain; E. N. Hammond, of Southampton, L. I.; H. T. Hughes, of Utica; F. L. Hunt, of Smithtown Branch, L. I.; P. S. Kneeland, of Newark, N. J.; H. G. Krepfel, of Brooklyn; W. A. Lenrow, of Newark, N. J.; L. G. Linford, of Liberty; John McKeown, of South Amboy, N. J.; Ernest McWhorter, of Highland Mills; Andrew Makaas, of Brooklyn; B. I. Marquez, of Pese, Panama; Philip Mazzoni, of Town of Union, N. J.; Harry Miller, of Portchester; Leon Monell, of Binghamton; Henry Miller, and S. I. Miller, both of Brooklyn; Solomon

Neiman, of Yonkers; O. J. Neundorfer, Jr., of Albany, Ga.; G. B. Noble, of New Milford, Conn.; H. A. Pietri, of Ponce, Porto Rico; G. L. Rogers, of Antwerp; Morris Salomon, of Brooklyn; G. W. Short, of Calais, Me.; Emil Steiert, of Astoria, L. I.; D. S. Treat, of Seymour, Conn.; A. E. Wick, of Utica; Theodore Weicker, of Stamford, Conn.; Samuel Wilkinson, of Livingston Manor; and Fred Gendell, of Rye.

The graduates in the food and drug analysis class were Ephraim Freedman and Miss Fannie Hart, both of New York city.

The officers of the graduating class were: President, W. E. Warner; vice-president, F. J. Brannigan; secretary, L. M. Monell; treasurer, D. S. Treat; historian, Harry Miller; reporter, H. G. Kreppel; and valedictorian, C. W. Dunn.

Northwestern University.

At the commencement exercises of the Northwestern University School of Pharmacy held April 13th the degree of graduate in pharmacy was conferred on the following class:

Charles C. Anderson, Lee Henry Andre, David Baxter, Edward V. Boarini, Roy E. Buck, Leo M. Cady, L. Bruce Campbell, Jay J. Cook, Robert E. Coughlan, Eugene F. Daudein, Harold P. Derebey, Robert W. Donaldson, Harry M. Donichy, Madison C. Donnell, C. S. Eftaxopoulos, Samuel Eppelsheimer, Charles I. Gimbel, Jack P. Halliwell, Selmer H. Hanson, Thomas F. Heffernan, Alfred Hendrickson, Waldemar H. Hendrickson, Fred Le Roy Hill, Herbert E. Hillebrecht, Clifford P. Hoaglund, Oscar H. Johanson, Bert N. Johnson, Melvern L. Johnson, Edward S. Kaufmann, Albert J. Kohlman, Raymond R. Little, Carl A. Mackh, H. Farris Miller, William S. Musser, G. William Nesbit, Maurice M. Newman, Mary C. Nolan, Walter O. Nolting, Edward L. Park, Walter L. Pulley, Arnold F. Schaeftgen, Thomas H. Schopp, Roy P. Stewart, Walter O. Stoll, Charles B. Stolz, Ernst A. Strassburger, Winfred E. Tanner, James W. Wade, Robert W. Weech, Fred D. Wilson, Arthur A. Zieske and John Zwack.

The degree of pharmaceutical chemist was given to James H. Dickey.

Philadelphia College.

Exercises marking the ninetieth commencement of the Philadelphia College of Pharmacy were held in the Academy of Music Thursday evening, May 25th.

The exercises were opened with prayer by the Rev. Edward S. Carson, and the class was addressed by Willis L. Moore, chief of the United States Weather Bureau.

It was announced that George W. Hayes, of Lebanon, Pa., '82, who died some months ago, had provided for an award to the best student in the first class graduated after his death of a gold watch which Mr. Hayes had received as a prize offered by a manufacturer at the time of his graduation. The award had been made to him for the best thesis on powdered drugs. His fellow-graduate, Joseph L. Lemberger, a vice-president of the college, had been charged with carrying out Mr. Hayes' wishes, and he presented the watch to Pierce Raymond Carpenter, of Lebanon.

The title of "distinguished" was shared with Mr. Carpenter by Herman Leo Hinski, of Philadelphia; the students named as meritorious were John Albert Butler and Morris Haimowitz.

Other prizes and honors were awarded as follows: Webb Memorial, to Mr. Carpenter; chemistry, to Edwin Kramer Morris; materia medica, also post-analytical chemistry, to Herman Leo Hinski; operative pharmacy, to Thomas Bernard Tanner; pharmacognosy, to William Wilson Rose; botany, to Adolf Gustav Wepfer; theoretical pharmacy, to Mr. Carpenter; commercial training, to Edward Percy Runyan; instructor's, to S. G. W. Martz; pharmacy quiz, also to Mr. Martz; Kappa Psi Fraternity, to Mr. Carpenter; athletic, to Clyde Raymond Hitchcock.

Degrees were conferred as follows:

Doctor in pharmacy, on James N. Allison, John W. Atkins, Samuel Baradofsky, De Wilton S. Berry, Lee O. Bloes, Chester E. Bollinger, Kersey E. Bradley, Oscar O. Bradley, Franklin C. Brush, Lloyd Burr, John A. Butler, William R. Calvin, George W. Carey, Pierce R. Carpenter, Philip Cohen, Clayton E. Costenbader, William B. Crawford, Elliot V. Davis, John Henry Donnelly, David E. Edwards, James H. Ennis, Jr., Nathan M. Friedman,

Walter J. Caskell, Charles W. Greeninger, Morris Haimowitz, Clyde R. Hancock, Clifton E. Heacock, John C. Held, Jr., Robert E. Hemminger, Herman L. Hinski, David E. Johnson, Carl F. Koehler, Oscar Perry Kraemer, Walter I. Lightner, Louis Longaker, Ellsworth W. Lynn, Edgar W. Lowe, William C. McNutt, William E. Marshall, Joseph Stanislaus Martin, S. G. W. Martz, Frederick T. Melville, Martin L. Messinger, Jacob J. Miller, Jr., Noble C. Miller, Louis H. Myers, Clark Neal, George W. Patterson, Jr., Leon K. Paxson, Robert E. Phillips, Albert Rachmil, John M. Ralston, Julius J. Rapaport, Thomas P. Read, Wallace S. Rice, Samuel Rosenberg, Roswell J. Rothrock, Edwin P. Runyan, Edward H. Ryan, George I. Sammons, Paul D. Sands, Howard C. Schauerman, Frank W. Schell, Nathaniel J. Segal, George K. Shearer, George F. Shugars, Edgar C. Smith, Marshall P. Synder, Morris Stein, Raymond A. Strauss, William E. Sylvestre, Thomas B. Tanner, Leith S. Temperton, William H. Udell, Samuel P. Verstine, Llewellyn J. Watkins, John Wear, John C. Winter, James S. Wolford and Frank A. Young, all of Pennsylvania; Robert O. Beicker, of New Jersey; Norman C. Beckley, of Russia; Miss Jennie Bellitz, of Maryland; Arthur H. Carington and Alvah F. Creaves, of New York; Louis E. Christopher, of Massachusetts; David W. Eisman, of Russia; Walter J. Farrell, of New York; Claude E. Gault, of Ohio; David H. Gordon, of Georgia; Forel Hart and Clarence S. Herr, of Ohio; Lyle V. Hendricks, of Oregon; Charles P. Hildebrand, of North Carolina; Herman S. Hasfield, of Ohio; Herman L. Lemen, of Maryland; William N. Lathrop, of Connecticut; Edwin K. Morris, of Virginia; Albert W. Moore and Charles Muthig, of New York; Samuel Millrood, of New Jersey; John E. Morley, of Russia; Lewis W. Oswald, of New York; Theodore R. Penney, of Oklahoma; Albert W. Pettit, of New Jersey; Frank O. Patton, of Massachusetts; William W. Rose, of Delaware; Edson W. Rogers and Israel Ronner, of New Jersey; Frank L. Riley, of Maine; Robert E. Smith, Jr., of Florida; Stanley A. Shiles, of Delaware; Ethelbert Steelman, of Indiana; Wilbert Somers, of New Jersey; Elias Shaker, of New York; Miss Selma L. Schmidt and Paul H. Southard, of Ohio; Arno R. Sasse, of Missouri; Frank P. Vaninweger, of New York; and Adolph G. Wepfer, of Wisconsin.

Pharmaceutical chemist, on Julius L. Charleston, Frank Duvoisin, William C. Flickinger, William L. Graeff, Harrison W. Gregory, Francis X. Hedges, Daniel J. Langton and C. F. Shoemaker, of Pennsylvania; Mrs. F. H. Greaves, of North Dakota; E. S. Hartenstein, of Illinois; and R. J. Kramer, of West Virginia.

Certificates of proficiency in chemistry were given to Charles Duvoisin and J. Harry Swain, of Pennsylvania; James H. Allen, of Georgia; Edward O. Dentzler, of Connecticut; and Frank E. Haines, of New Jersey.

The pure food and drug course was completed by Peter Amsterdam, of Russia.

St. Louis College.

At the forty-fifth annual commencement exercises of the St. Louis College of Pharmacy, held April 25th, the following students were graduated:

As graduate in pharmacy: C. B. Allen, E. Carnahan, J. B. Coats, J. G. Couper, L. L. Crocker, E. A. Dean, H. A. Dinges, H. C. Dyer, E. Erdsiek, A. C. Fisher, P. S. Grenslet, J. A. Gettinger, B. H. Griesedieck, R. H. Hale, H. P. Hansell, F. A. Hoch, C. E. Jones, L. R. Knewitz, O. W. H. Koch, R. H. Krummenacher, V. H. Krummenacher, J. Lieberstein, R. M. Llewellyn, G. A. McCall, E. L. Miche, T. L. Parrish, E. F. Paul, F. J. Reininger, C. F. Reinderer, E. S. Sauls, J. W. S'Renco, A. J. Sweeney, F. E. Tate, C. F. Warts, F. G. Ward, C. Y. White, L. T. White and M. Q. Williams.

As bachelor of pharmacy: C. R. Archibald, H. L. Baepeler, H. H. Bentz, E. M. Boehm, G. Bosche, H. A. Brown, A. G. Burnette, I. H. Copeland, A. J. Gerding, A. Guthrie, Jr., B. W. Holmes, F. J. Kiessling, G. W. Meeks, T. H. Mitchell, O. C. B. Nau, F. C. Raber, H. Riska, W. A. Scholz, F. W. Sittermann, T. G. Stanton, F. A. Steiner, F. M. Trotter, M. B. Tuck, G. C. Whiteside, and O. Williams.

As pharmaceutical chemist: E. M. Schaefer.

A writer to the *British Medical Journal* says that a coroner's jury in England recently gave the following verdict: "The man died from stone in the kidney, which stone he swallowed when lying on a gravel path in a state of drunkenness."

The Pharmaceutical Society of Great Britain.

The seventieth anniversary of the British Pharmaceutical Society recently commemorated, is an interesting event in the history of pharmacy.

In its way the society is a unique institution since it is the statutory examining body without whose diploma no person in England, Scotland or Wales can sell poison by retail or use the title of "chemist and druggist"; it also administers the law relating to the sale of poisons and prosecutes hundreds of persons each year for selling poison in an irregular manner. Membership of the society is voluntary, and the number of members is over 7,000, but all pharmacists, whether members or not, are obliged to comply with the law administered by the society.

It will be interesting to trace briefly the history of this organization, which has not been uneventful, and to look back at the conditions of pharmacy in the days before the society came into being. Prior to 1841 the sale of drugs and the compounding of medicines was in the hands of a variety of traders, including doctors, apothecaries, grocers, chemists and a comparatively small body who called themselves chemists and druggists. This body had been brought into existence a century earlier as the result of a quarrel between the physicians and the apothecaries. In those days the physicians obtained their diplomas from the Bishop of London and the Dean of St. Paul's and had the exclusive right by law to practice medicine; but the apothecaries, who were originally drug sellers, encroached upon their domain and aroused the ire of the physicians. In order to retaliate, the physicians established dispensaries and advised their patients to have their prescriptions made up there rather than at the apothecaries' shops. In course of time the assistants employed at these dispensaries opened shops of their own and it was from these that the chemists and druggists, who founded the Pharmaceutical Society in 1841, were descended. At that time doctors' shops doing a regular trade were quite as numerous as chemists' shops, even more so in some localities. They were often left in charge of young medical apprentices or of doctors' boys whose mistakes were covered by the wit of the employer; in fact the Bob Sawyer type of character, in a somewhat modified form, was not at all infrequently met with. Next in frequency would come the druggists, and there was a sprinkling of really good chemists and druggists' shops, carried on personally by men who in their youth had received a decent education and had served seven years' apprenticeship.

The consumption of medicines, chiefly aperients, was very large. Colocynth and other pills, extract of senna, Epsom salt, Gregory's powder, and like medicines were taken in enormous quantities. Boluses, of which one never hears nowadays, were a common form of medicine. The bolus consisted of 30 grains or so of a pasty mass which was placed on the middle of a piece of stiff writing paper 2 or 3 inches square. The paper was then folded diagonally across the middle, forming a right angled triangle, and the free edges folded tightly together as in folding a powder. The patient was instructed to lick the mass off the paper and swallow it with a mouthful of water. It was supposed to be more prompt in its action than pills, from its softness and consequent ready solubility. As now a large amount of dispensing was done by the medical man or his assistant.

No organization existed and if things had gone on in the same hap-hazard sort of way, pharmacy would never have advanced to the extent which it has done. Chemists and druggists were brought together in order to protect themselves against the physicians and encouraged by success in opposing legislation proposed by the latter they resolved to form a permanent organization and a meeting was summoned on April 15th, 1841, at the Crown and Anchor Tavern in Fleet street, at which it was unanimously resolved to form an association to be called the Pharmaceutical Society of Great Britain in order to increase the respectability of chemists and druggists, and protect their interests. Two months later, the first meeting was held and William Allen, F. R. S., was elected president. There can be little doubt that the society's success in the first few years of its existence was due to the influence of its first president.

Allen was a druggist with a business in Plough Court in the City of London, which business, by the way, was the beginning of the large concern now known as Allen & Hanbury's; he had as a partner Luke Howard, who, in course of time, left the shop and founded a manufacturing

business which has developed into the firm of Howard & Sons, Limited. He was a great friend of Wilberforce and associated with him in his campaign against the slave traffic; Clarkson wrote most of his History of the Slave Trade in Allen's house above the shop. The first president was indeed a notable character; in addition to being a scientist of no mean repute, he was a well known politician and philanthropist, and what was of still greater importance, was in close touch with royalty. Edward, Duke of Kent, the father of Queen Victoria, owing to one cause or another, was in financial difficulties and on Allen's advice he lived abroad on a small allowance and appointed trustees, of whom Allen was one, to pay off his debts with the remainder of his income. When all the debts were settled the Duke and Duchess returned to England, and so it happened that the future Queen was born on English soil. When the Duke died Allen was one of his executors and consequently was frequently brought into touch with the young princess. William Allen was also a friend of Alexander I., Emperor of all the Russias, who accompanied him to the Quakers' Meeting House in London at which Allen was a regular attendant; he also visited the Emperor at St. Petersburg. The founders of the society could not possibly have selected a more important or influential person as their leader.

The first efforts of the newly formed society were directed to the improvement of pharmaceutical education and within a few months of its foundation a school was established and within three years a laboratory was equipped which was the equal of any of its kind in Germany or France and the only one in England. Examinations were planned and diplomas granted to successful candidates. It was not, however, until 1852 that the society obtained any protection for its members from the government and all that the act of 1852 did was to restrict the title of pharmaceutical chemist, and other titles, to those who had passed the examination. Ten years earlier, the society had already obtained a royal charter and, while this gave them a good status, it gave chemists and druggists no privileges. It was not until 1868 that any legislation was had to restrict the sale of poisons to chemists and druggists and owing to a fault in the drafting of this act the protection which it was intended to afford failed, to a very large extent, because, while it prohibited the sale of poisons by an unregistered person, it did not prohibit the sale by companies. The consequence of this flaw was that the drug business was largely exploited by companies of unqualified persons to the detriment of qualified individuals. The difficulty was remedied to some extent a few years ago, but companies are still able to practice as pharmacists provided that they employ qualified managers.

The society has had some notable presidents besides William Allen, for instance, Morson, who was one of its earlier presidents, was the first to manufacture quinine and morphine on a commercial scale; this he did at the back of his little shop in the City of London. He sold the quinine at the equivalent of \$16 an ounce, and the morphine at \$36 an ounce. Another of the early presidents was Jacob Bell, who founded the *Pharmaceutical Journal* in 1841; he carried on business as a chemist in Oxford street, but was best known as a member of parliament and an art patron; he was a close personal friend of Millais. There have been other notable presidents but these three will suffice to show that the history of the Pharmaceutical Society has not been an uninteresting one.

The Bathroom Drug Store.*

By ROY L. MCCARDELL.

"I'm not feeling so very well this evening," said Mr. Jarr. "I wonder what would make me feel better?"

"Are you really feeling bad, or are you encouraging yourself to take a short walk in the direction of the corner, to your friend Gus's place?" asked Mrs. Jarr. "If this last is the case, I can assure you that your friend Gus has nothing to sell or give you that will do you any good. You have tried it often enough without success to know it by this time."

"No ulterior motive actuates me," replied Mr. Jarr. "I don't feel very good, that's all."

"It's your stomach," said Mrs. Jarr. "You would stay out late last night; you were playing pinochle and you drank more beer than was good for you."

*Copyrighted, by the Press Publishing Company; from the New York World, by permission.

Mr. Jarr only sighed and said nothing. What's the use to say anything?

"Maybe if you take a little cooling soda—a teaspoonful in half a glass of water—you'll feel better," suggested Mrs. Jarr. "You'll find some in the kitchen."

Mr. Jarr went out to look for it. He found washing soda, but not of the edible variety.

He returned and reported the fact.

"Look in the medicine closet in the bathroom," said Mrs. Jarr.

So Mr. Jarr looked and beheld an amazing collection of half-filled, sticky bottles; small packages in white and blue paper, folded, but not tied, from which all sorts of white, gray and yellow powders were sifting out. There were also wooden boxes and round milk-colored glass screw-top receptacles, holding salves, ointments and notions of all kinds. There were paper pill boxes, empty and half full; little square pink boxes with folded papers, containing powders, and marked "Take one every two hours," and many other odd-looking and queer-smelling holders of pills, potions and compounds, nameless and mysterious, such as every good wife and mother hoards up throughout the years, to the great astonishment of the male mind.

"Darn it! I can't find any soda!" shouted Mr. Jarr, as he knocked over and out on the floor a little avalanche of bottles, boxes and powders.

"My goodness! Why are you so careless?" cried Mrs. Jarr, coming in, "and I just straightened up that medicine closet last Saturday."

"What's this?" asked Mr. Jarr, opening a folded little paper packet. "Maybe this is it?"

"You put that right up; that's bismuth, I think—no, it's powdered alum." As she said this Mrs. Jarr moistened the tip of her finger and tasted the powder. "No, it isn't powdered alum," she said, "but it's something. You put it up on the top shelf, and the next time the doctor comes I'll ask him what it is."

"Maybe if I took some of this headache powder I'd feel all right," suggested Mr. Jarr. "This is one of the few things that has any mark on it saying what it is," and he opened one of the pasteboard boxes.

"Don't touch that!" said Mrs. Jarr. "That's foot powder to shake in your shoes. I remember I put it in there because Willie wanted the foot powder box because it was a pretty red color."

"What's this?" asked Mr. Jarr, holding up an extremely sticky bottle with a teaspoonful of heavy liquid in the bottom, in which reposed, for it was uncorked, some seven flies embalmed therein.

"I think that's the iron tonic we gave Willie when he had tonsillitis," said Mrs. Jarr. "No," here she smelled at the bottle, "it's syrup of squills."

"Don't you think it should be thrown out?" asked Mr. Jarr.

"Now you leave those things alone!" cried Mrs. Jarr: "Suppose the children should get sick in the night, and I hadn't a thing handy?"

"Do you think flies preserved in syrup of squills is a specific for infantile disorders?" said Mr. Jarr.

"You just come away from that medicine closet!" cried Mrs. Jarr sharply. "You've spilled the sweet spirits of nitre. No, it's the eye wash, and that reminds me—now I know what's in that paper package you wanted to take as soda if I hadn't stopped you; it's powdered borax. There it was all the time and I was going to send out and get some. It's just the thing to keep colors from running, borax and alum, if you are washing figured lawns or anything like that."

"What are these?" asked Mr. Jarr rattling a box of pills. "The box says 'External use only.' How can pills be taken externally?"

"You leave those things alone!" said Mrs. Jarr sharply. "They are three-grain quinine pills and I put them in that box for safekeeping. They were in a bottle, a hundred for twenty cents, and I needed the bottle to get paregoric in because the druggist charges you five cents for a bottle when you want ten cents worth of anything."

"What's the use keeping all this unknown dope, these odds and ends unnamed and unlabeled?" asked Mr. Jarr.

"Because any of them may come in handy when needed suddenly," replied Mrs. Jarr. "You see, if I had any cooking soda in here I wouldn't have to send out and buy some for you." And she pushed him away from the cabinet of mysteries.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

ALABAMA—E. P. Galt, Selma.

ARIZONA—November 8th, at Phoenix. A. G. Hulett, Phoenix.

ARKANSAS—J. F. Dowdy, Little Rock.

CALIFORNIA—July 19th, at Los Angeles; July 26th, at San Francisco. Louis Zeh, San Francisco.

CONNECTICUT—June 6th, at Hartford. J. A. Levery, Bridgeport.

COLORADO—June 10th and 11th, at Denver. S. L. Bresler, Denver.

DELAWARE—Albert Dougherty, Wilmington.

DISTRICT OF COLUMBIA—July 13th and 14th, at Washington. S. L. Hilton, Washington.

FLORIDA—June 12th and 13th, at Tampa. D. W. Ramsaur, Palatka.

GEORGIA—C. D. Jordan, Monticello.

IDAHO—J. M. Starrh, Shoshone.

ILLINOIS—F. C. Dodds, Springfield.

INDIANA—July 11th and 12th, at Indianapolis. W. H. Ruder, Salem.

IOWA—June 6th, at Des Moines. E. J. Moore, Des Moines.

KANSAS—W. E. Sherrieff, Ellsworth.

KENTUCKY—July 11th and 12th, at Paducah. J. W. Gayle, Frankfort.

LOUISIANA—August 4th and 5th, at New Orleans. F. A. Earhart, New Orleans.

MAINE—June 14th and 15th, at Augusta. F. W. Bucknam, Skowhegan.

MARYLAND—Ephraim Bacon, Roland Park.

MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.

MICHIGAN—E. J. Rodgers, Port Huron.

MINNESOTA—July 18th, at Minneapolis. C. T. Heller, St. Paul.

MISSISSIPPI—October 3d, at Jackson. L. H. Wilkinson, Greenwood.

MISSOURI—June 12th, at Cape Girardeau. C. E. Zinn, Kansas City.

MONTANA—October 11th, at Great Falls. S. J. Coffee, of Missoula.

NEBRASKA—A. V. Pease, Fairbury.

NEVADA—November 1st, at Reno. R. L. Prouty, Tonopah.

NEW HAMPSHIRE—F. H. Wingate, Nashua.

NEW JERSEY—July 20th and 21st, at Trenton. H. A. Jordan, Bridgeton.

NEW MEXICO—A. J. Fisher, Santa Fe.

NEW YORK—June 28th and 29th, at New York, Albany and Buffalo. W. L. Bradt, Albany.

NORTH CAROLINA—July 7th, at Morehead City. F. W. Hancock, Oxford.

NORTH DAKOTA—June 20th, at Fargo. W. S. Parker, Lisbon.

OHIO—June 20th to 23d, at Columbus. F. H. Frost, Columbus.

OKLAHOMA—July 11th and 12th, at Oklahoma City. J. C. Burton, Stroud.

OREGON—June 6th and 7th, at Portland. F. C. Pozzi, Portland.

PENNSYLVANIA—June 8th and 9th, at Pittsburg and Philadelphia. L. L. Walton, Williamsport.

RHODE ISLAND—June 6th, at Providence. J. E. Brennan, Pawtucket.

SOUTH CAROLINA—July 3d and 4th, at Greenville. F. M. Smith, Charleston.

SOUTH DAKOTA—July 12th, at Lead. E. C. Bent, Dell Rapids.

TENNESSEE—July 10th and 11th, at Nashville. I. B. Clark, Nashville.

TEXAS—R. H. Walker, Gonzales.

UTAH—July 18th and 19th, at Salt Lake City. W. H. Dayton, Salt Lake.

VERMONT—D. F. Davis, Barre.

VIRGINIA—July 25th, at Richmond. T. A. Miller, Richmond.

WASHINGTON—P. Jensen, Tacoma.
 WEST VIRGINIA—A. Walker, Sutton.
 WISCONSIN—Edward Williams, Madison.
 WYOMING—C. B. Gunnell, Evanston.

California Board.

At the meeting of the California Board of Pharmacy held at Los Angeles during the week beginning April 12th, and at San Francisco, in the following week, the successful applicants for registration were as follows:

As pharmacists—W. P. Bailey, B. A. Baldwin, H. V. Becker, D. A. Boal, Henry Boettcher, H. C. Brown, A. J. Bruce, E. M. Burns, H. A. Cook, W. W. Cope-land, J. F. Cramer, W. A. Davis, J. F. Delury, L. J. Dignan, W. S. Dupont, G. T. Edwards, J. P. Ferguson, C. J. Gillen, J. A. Godwin, S. D. Grove, Carl Hamilton, G. G. Harvey, M. W. Hefton, E. A. Heller, H. H. Hertz, F. T. Hoaglund, H. E. Kenyon, W. H. Koch, W. G. Lidley, W. C. Lovelace, C. B. Marsden, L. C. Marsh, H. C. Marvin, T. L. Moore, W. L. Mowry, S. H. Oliver, L. W. Oswald, Judson Oviatt, W. G. Peasson, R. J. Pedroni, F. H. Roberts, William Rolls, Oliver Savill, W. A. Sears, Jr., J. H. Serr, C. F. W. Smith, H. A. Smith, M. D. Stauffer, F. G. Tanck, A. F. Upp, Fernand Vigue, L. E. Walker, I. E. Wallace, J. C. Walton, and F. H. Whitman.

As assistants—O. Arnstad, A. C. Brown, E. V. Callander, L. S. Chambers, G. L. Dumpert, J. J. Early, L. G. Grossi, A. R. Harriman, G. E. Hitzelberger, A. S. Knudson, A. R. Lainer, C. La Moine, L. H. Leibe, J. I. Lorton, Glenn May, P. E. Meyer, A. N. Moody, J. F. Oldham, L. A. Ramey, W. L. Reburn, V. L. Rodda, L. M. Roeg, M. M. Sobel, C. A. Woodson, and G. T. Wolfe.

The next meeting of the board will begin July 17th, at Los Angeles and will be continued there and later at San Francisco for two weeks.

Several convictions have been secured by the board in prosecutions of doctors for prescribing morphine in illegal quantities, and of druggists for refilling prescriptions for morphine and dispensing more than the prescription called for.

Delaware Board.

There were eight applicants for registration at the meeting of the Delaware Board of Pharmacy held April 19th. The following four were successful:

As a pharmacist—Mrs. J. J. Gallagher, of Wilmington.
 As assistants—Leroy Collins, T. J. Grant, and R. M. Sanders, all of Wilmington.

Illinois Board.

The Illinois Board of Pharmacy asks that publicity be given to the appended notice to prospective applicants for registration as pharmacist and local pharmacist:

The prospective applicants for examination as registered pharmacist and local pharmacist in Illinois:

Your attention is called to the fact that the forty-seventh general assembly, in an amendment to the pharmacy law, raised the fee for filing applications for examination as registered pharmacist and local registered pharmacist from \$5 to \$10.

If this law is approved by the governor, it will be effective July 1st of this year, and the fee for filing all applications for examination as registered pharmacist and local registered pharmacist after that date will be \$10.

Kentucky Board.

At the meeting of the Kentucky Board of Pharmacy held April 11th and 12th, at Louisville, fifty applicants for registration were examined, and the following thirty-three were passed:

As pharmacists—F. T. Bisig, of Louisville; William Bleiweiss, of Newport; Jas. F. Conwell, of Covington; G. J. Ellis, of Glasgow; Louis Horwitz, of Lockland, O.; H. M. Hubbard, of Lexington; E. D. Mullins, of Wingo; B. F. Rowland, of Corbin; E. W. Sperzel, of Louisville; and Marvin Wells, of Greenville.

As assistants—J. W. Demling, F. L. Eisen, Katherine E. Fernow, J. H. Honaker, L. C. Krebs, G. A. Miller, W. C. Murphy, O. L. Perkins, H. F. Pesel, Clara L. Ritsert, and J. A. Thornton, all of Louisville; G. W. Beck, of Versailles; F. A. Burg, of Chillicothe, O.; R. P. Holland, of Murray, F. S. Kincheloe, of Hardinsburg; H. F. Klein, of Newport; Orin Lee, of Middlesboro; R. A. Martin, of Dayton; Leo Nesbitt, of Frankfort; F. E. Patterson, of Vine Grove; R. S. Quinn, of Henderson; G. A. Vallandingham, of Owenton; and Frederick Vermillion, of Winchester.

A report was received from the attorney for the board that the license of C. J. Dill, of Ashland, was void because

it had been falsely obtained, the licensee having been represented at the October, 1910, examination by James Fitzgerald, a licentiate of the Ohio Board of Pharmacy. Both these persons had subsequently been prosecuted and, pleading guilty, had been fined each \$100. To lessen the chances for such deception in the future the board decided to require applicants to submit photographs and to satisfy a referee in their home county as to their identity.

The next meeting of the board will be held July 11th and 12th, at Paducah.

Louisiana Board.

As a result of the examination at the meeting of the Louisiana Board of Pharmacy held May 5th and 6th, at New Orleans, fifteen persons have been licensed; fifty candidates were examined. The successful ones are:

As pharmacists—C. C. Chapman, of Centerville, Miss.; A. R. Holloway, of Bunkie; E. C. Kinder, of Homer; J. B. Lavigne, Jr., of New Orleans; F. C. Mouton, of Lafayette; M. L. Nash, of Monroe; J. D. Navarrine, of Palmira, Cuba; J. A. Nelson and G. A. Rojas, both of New Orleans; B. G. Sanarens, of Charenton; P. M. Schertz, of New Orleans; C. Stoppers, Jr., of Baton Rouge; D. V. Stuart, of Centreville, Miss.; and C. F. Williams, of New Orleans.

As assistants—G. V. Claren, Jr., of New Orleans; A. P. Lauve, of Jeanerette; T. P. Roggio, of De Ridder; and C. J. Wichser, of New Orleans.

The next meeting of the board will be held at New Orleans, August 4th and 5th.

Maine Board.

At the meeting of the Maine Board of Pharmacy held April 12th and 13th, at Augusta, eighteen applicants for registration were examined, of whom the following six were successful:

B. E. Bither, of Augusta; C. S. Blackington, of Bath; W. M. Chase, of Bangor; J. H. Coakley, of Rockland; W. E. Murphy, of Portland; and J. M. Sullivan, of Biddeford.

The next meeting of the board will be held June 14th and 15th, at Augusta.

Maryland Board.

At the meeting of the Maryland Board of Pharmacy held April 12th and 13th, at Baltimore, the following passed the examinations:

As pharmacists—Filberto Artigiani, C. M. Branning, Frederic Garrison, Louis Gitonirsky, W. S. Harrison, J. C. Hudson, L. R. Laroque, L. T. Lombard, E. L. Mueller, C. N. W. Oertel, P. E. Plunkett, T. F. Ragland, A. W. Smith, P. P. Towers, G. H. Waltz and C. W. Wilhelm, all of Baltimore; O. L. Johnson, of Lancaster, S. C.; Dr. M. D. Ke-tauver, of Smithsburg; and J. C. Woodland, of Crisfield.

As assistants—M. J. Bransky, S. A. Craig, Alexander Cohen, C. A. Davis, Herman Dietel, Jr.; H. F. Hein, W. V. Jackson, H. W. Jones, R. T. Kelly, Jr.; E. C. Krupnick, S. M. L. Leberman, D. P. Lillick, C. O. Miller, L. A. C. Munzert, and L. M. Richardson, all of Baltimore; B. T. Durdin, of Snow Hill; T. P. Flynn, of Unionville, Conn.; J. C. Jones, of Berlin; Cordelia L. Mikules, of Mt. Ranier; P. N. Stouffer, of Hagerstown; W. S. Walb, of Philadelphia, Pa.; D. C. Ward, of Elkins, W. Va.; D. A. Warren, of Snow Hill.

Massachusetts Board.

During the month of April the Massachusetts Board of Pharmacy conducted five examinations, passing upon the fitness of eighty-seven applicants for registration. The following thirty-nine were passed:

As pharmacists—A. L. Ballard, of Boston; H. H. Bronson, of Palmer; C. H. Creelin, of Pittsfield; J. H. Crowley, of Holliston; W. J. Danforth and L. Dronsich, both of Boston; C. E. Hoffman, of Clinton; H. B. McCormick, of Cambridge; J. J. McDonell, of Holyoke; C. C. Mathews, of Colchituate; H. F. Murray, of Boston; L. P. Pond, of Chelsea; A. J. Pratt, of North Adams; G. F. Ramponi, of Boston; and Fred Toohey, of Lawrence.

As assistants—F. Beauchamp, of Boston; H. F. Brightman, of Portsmouth, N. H.; D. J. Byrne and C. A. Clark, both of Boston; M. W. Corbin, of Worcester; F. H. Dowst, of Salem; C. L. Ely, of Springfield; F. A. Flynn, of Lawrence; F. W. Gardner, of Lawrence; J. T. Gurl, of Springfield; J. W. Harvey, of Danvers; W. T. Jackson, of Boston; T. P. Keating, of New Bedford; S. M. Lapp, of Boston; F. T. Lewis, of Worcester; T. Montcalm, of Holyoke; J. F. Mulcahy, of Brookfield; J. L. O'Reilly, of Lawrence;

H. Ostrer, of Boston; G. B. Sellers, of Lawrence; P. D. Spaulding, of Boston, G. H. Sweet, of Milford; and R. B. Wilkie, of Boston.

Minnesota Board.

Out of the 122 applicants for registration who were examined by the Minnesota Board of Pharmacy at its April meeting, only thirty-four were successful. The names of the successful ones follow:

As pharmacists—B. H. Day, of St. Paul; H. B. Jensen, of Bagley; E. P. Jones, of Blue Earth; T. T. Klovstadt, of Minneapolis; O. J. Lundemo, of Duluth; T. B. McGovern, of Minneapolis; W. J. Mueller, of Deer River; N. W. Root and F. E. Turton, of Minneapolis; J. M. Sansby, of St. Paul; and E. A. Wahlstrom, of Center City.

As assistants—E. M. Adams, A. J. Austin, J. E. Bierle, C. M. Larson, Frank Murray, J. F. Pelant, and S. L. Rosenfield, all of Minneapolis; O. J. Bruning, of St. Cloud; C. C. Cowden, of Anoka; M. J. Cox, of Hibbing; Joseph Demel, of St. Paul; F. A. De Witz, of Red Wing; V. E. Lundbohm, of Warroad; C. E. McLane, of Litchfield; R. B. Meland, of Pelican Rapids; P. C. Pederson, of Hawley; A. W. Peterson, of Litchfield; C. R. Reiersen, of Spring Grove; B. V. Stickney, of Wendell; G. C. Wirth, of Duluth; and O. E. Zandell and C. J. Zwerenz, both of St. Paul.

The next meeting of the board will be held at Minneapolis, beginning July 17th.

Montana Board.

Thirty-five applicants for registration were examined at the meeting of the Montana Board of Pharmacy held April 12th to 14th, at Butte. Twenty-four of these were successful, their names follow:

As pharmacists—C. E. Beckhorn, of Helena; B. A. Benedict, of Libby; C. S. Brown, of Anaconda; G. K. Carlson, of Polson; F. M. Chastek, of Thompson; H. A. Crane, of Forsyth; Richard Engstrom, of Minneapolis, Minn.; C. E. Kenyon, of Great Falls; LeRoy Larson, of Helena; J. R. Morford, of Billings; Lester Morris, of Corvallis; L. H. Morrow, of Helena; J. M. Princell, of Glendive; W. W. Wagstaff, of Butte; F. O. Wheeler, of Great Falls; M. F. Whiteman, of Missoula; N. W. Wilson, of Philbrook; and W. E. Young, of Three Forks.

As assistants—W. P. Callow, of Great Falls; C. A. Jensen, of Butte; J. L. Moore, of Manhattan; Frank Reavley, of Great Falls; H. E. Swanson, of Missoula; and H. O. Turner, of Sydney.

This being the annual meeting an election of officers occurred, which resulted in the choice of the following: President, T. M. Kehoe, of Billings; treasurer, Emil Starz, of Helena; and secretary, S. J. Coffee, of Missoula. Mr. Starz is a new member of the board, succeeding J. L. Kraker, of Bozeman.

Mr. Coffee was a caller at the CIRCULAR office a few weeks ago, and had some interesting information to impart concerning the endeavors of the board to assure for Montana a high-grade of pharmacists. He naively remarked that, as the pay of registered drug clerks in that State and their general condition are much above the average, the board felt it to be its duty to see that those securing registration possessed more than mediocre ability. The next meeting of the board will be held October 11th, at Great Falls.

New Jersey Board.

Appended are the names of the successful applicants for registration whose fitness was determined at the meeting of the New Jersey Board of Pharmacy held at Trenton, April 20th and 21st.

As pharmacists—R. E. V. Angresius, Annibale Berardinelli, P. D. Bloom, J. J. Cassidy, Vincenzo Cataldi, J. B. Grossman, W. A. Lenrow, Max Starr, and Joseph Weisberger, all of Newark; C. C. Christensen, Alfred Diedrich, J. W. Goldberg, Elvira Kalkbrenner, M. L. Kobelin, Jennie Loeb, G. M. Perry, Samuel Saletan, M. R. Willmer, and William Wolf, all of Brooklyn, N. Y.; Jacob Cohen, Roberto Filice, Max Fried, M. J. Fried, Jacob Morgulis, Solomon Neiman, Sachar Stehukin, and Herman Vogel, all of New York, N. Y.; H. L. Debus, C. W. Dunn, Ephraim Feldman, Helen Glucksmann, W. J. Jordan, Jacob Kessler, W. H. Moessner, F. E. Schwartz, and Matthew Weber, all of Jersey City; Emil Cataldi, of Orange; H. M. Dawson, of Boston, Mass.; Jacob Goldberg, of Philadelphia, Pa.; E. M. Holmes, of Trenton; A. T. Huffman, of Millville; W.

H. Legg, and B. R. MacPhail, both of Paterson; A. W. Pettit, of Merchantville; W. L. Pratt and Israel Rovner, both of Philadelphia, Pa.; G. E. Stevens, of Somerville; and C. A. Winter, of Hoboken.

As assistants—Ignatz Goldberg, Louis Horwitz, A. V. Palumbo, Meyer Rubin, and M. J. Weiss, all of Newark; D. F. Bentley, Jr., of Camden; G. W. Dickie, of Morristown; Samuel Engelman, of Elizabeth; G. J. Evans, of Ocean Grove; C. E. Gault, of McComb, O.; J. W. Hankinson, of Maplewood; J. A. Jaffe, of Jersey City; E. J. Morris, of Trenton; E. H. Prickitt, and Leslie Southgate, both of Burlington; C. H. Stuhler, of Roselle Park; H. E. Weiss, of Gloucester City; and John Waszkiewicz, of Bloomfield.

The next meeting of the board will be held at Trenton, July 20th and 21st.

Oklahoma Board.

Of the fifty-three persons examined for registration at the meeting of the Oklahoma Board of Pharmacy held April 11th and 12th, at Oklahoma City, only the following twelve were successful:

T. B. Adams, of Oklahoma City; H. C. Alston, of Atoka; J. D. Bender, of Canadian; Margaret Dykes, of Spearville, Kan.; Harry Eshelman, of Wichita, Kan.; J. J. Estus, of Mulhall; H. J. Hammonds, of Atoka; S. L. Hubbard, of Hooker; N. J. Jenkins, of Oklahoma City; L. H. Randle, of Holdenville; J. H. Simmons, of Jenks; and N. F. Woolard, of Miami.

At the same time registration was granted to the following, without examination, by virtue of their possession of diplomas from schools of pharmacy recognized by the board.

G. C. Allen, of Enid; Mrs. M. L. Davis, of Supply; F. C. Dulgenan, of Marysville, Kan.; A. K. Folger, of Bartlesville; Verde Harrison, of Fargo; J. H. Loeffler, of Ilion, N. Y.; Frederick Tergue, of Whittier, N. C.; L. L. Topper, of Gettysburg, Pa.; and Clara C. Wood, of Jones City.

Registration was also granted to the following licensees of other boards with which the board has reciprocal relations:

M. D. Butler, of Okeene; E. J. Skidmore, of Oklahoma City; and Mary C. Weuster, of Wichita, Kan.

J. P. Mason, of Caddo, was registered on "original application."

The next meeting of the board will be held at Oklahoma City, July 11th and 12th.

Rhode Island Board.

At a meeting of the Rhode Island Board of Pharmacy held at Providence, May 2d, the following applicants for registration were successful:

A. W. Clafin, of Providence; A. M. McCaw, of Bristol; and A. J. Maille, of Providence.

The next meeting of the board will be held June 6th, at Providence.

Tennessee Board.

A meeting of the Tennessee Board of Pharmacy was held at Memphis, April 16th, at which thirty-three applicants for registration were examined. Nine were successful as follows:

F. M. Brown, of Morristown; Gertrude Bullock, of Nashville; M. L. Bullock, of Memphis; C. F. Gaylord, of Knoxville; M. L. Hurts, of Memphis; W. L. Lipscomb, of Dyersburg; E. J. Miller, of Jackson; J. N. M. Taylor, of Mason; and H. L. Waggoner, of Memphis.

W. H. Rudder, the secretary of the Indiana Board of Pharmacy was a visitor at the meeting.

W. A. McBath, of Knoxville, has been reappointed a member of the board.

The board will hold its next meeting July 10th and 11th at Nashville.

Utah Board.

At the meeting of the Utah Board of Pharmacy held April 18th and 19th, at Salt Lake City, eight of the fourteen candidates applying for registration passed the examination. The successful ones are:

D. E. Degeian, F. X. A. Eble, F. J. Folland, F. C. Hansen, and W. P. Stephenson, all of Salt Lake City; S. M. Brown, of Ogden; S. P. Lexow, Jr., of Castle Dale; and G. H. Lyon, of Murray.

The next meeting of the board will be held July 18th and 19th, at Salt Lake City.

Virginia Board.

The Virginia Board of Pharmacy held an annual meeting at Richmond, April 24th to 29th. During the session thirty-six applicants for registration as pharmacists and forty-four as assistants were examined. Of these, twenty-three and twenty-seven, respectively, were successful, these being the following:

As pharmacists—J. W. Fox, H. L. Livick, E. B. Moncure, J. W. Smith, Ward Stark, and B. L. Wright, all of Richmond; C. G. Brice, F. S. Hoback, M. J. Patzel, R. K. Rector, and L. G. Stiff, all of Roanoke; C. S. Bruce, of Culpeper; H. P. Carlin, of Alexandria; A. S. Cross, of Norfolk; C. H. DeFord, of Phoebus; J. B. Gillispie, of Lynchburg; W. H. Harrison, and F. N. Hillis, both of Norfolk; C. M. Lindley, of Emporia; L. G. Smith, of Hampton; L. C. Stratton, of Newport News; E. C. Thornton, of Warrenton; and R. H. Williams, of Petersburg.

As assistants—W. J. Adamson, Hugh Andrews, J. L. Blackburn, C. B. Board, B. F. Bowles, C. F. Dirickson, J. J. Harris, W. L. Irwin, C. W. Johnston, C. G. Patterson, E. A. Schaaf, A. B. Smellings, W. A. Smith, R. I. Stanley, and C. H. Thomasson, all of Richmond; W. G. Anderson, of Petersburg; W. W. Briggs, of Portsmouth; W. B. Furr, of Harrisonburg; M. B. Holtzclaw, of Jarrett; D. A. Lassiter, of Norfolk; Owen Morris, of Clifton Forge; H. M. Pettus, of Chase City; H. C. Reece, of Orange; P. S. Roach, of South Norfolk; J. A. Smith, of Belle Haven; G. B. Stover, of Norfolk; and H. S. Wyatt, of Hampton.

After a lengthy discussion, the board voted its approval of the National Pharmaceutical Syllabus.

The next meeting of the board will be held at Richmond, July 25th.

Wisconsin Board.

At the meeting of the Wisconsin Board of Pharmacy held April 11th and 12th, the following applicants for registration were successful:

As pharmacists—L. M. Broene, O. F. Haneisen, G. D. Howard, Oscar Rennebohm, H. E. Rubel, and H. F. Zimpelmann, all of Milwaukee; C. A. Abbott, of Ashland; W. M. Atwood, of Madison; A. B. Averbook, of Superior; W. C. Becker, of Watertown; W. R. Denu, of Madison; R. O. Fischer, of Jefferson; W. F. Gerbinsky, of Manitowoc; E. J. Gitter, of Oshkosh; E. H. Hahn, of DePere; W. S. Hammersley, of Lake Geneva; J. E. Hutchinson, of Columbus; W. O. Klenheim, of Madison; V. E. Noer, of Colfax; P. F. Pfeil, of Fond du Lac; W. R. Powals, of Ft. Atkinson; F. D. Schlitz, of Appleton; and E. J. Setz, of Lake Mills.

As assistants—A. H. Clark, James Flarity, N. T. Grasser, C. F. Bintz, Louis Moersch, and M. F. Wren, all of Milwaukee; J. A. Baker, of Randolph; A. E. Erickson, of Kenosha; W. G. Evenson, of Wareham; R. G. Germanson, of Grand Rapids; L. A. Hecker, of Watertown; Thorman Jacobson, of Escanaba, Mich.; J. J. Kazmierowski, of St. Francis; A. H. Krueger, of Watertown; W. C. Lalis, of Fond du Lac; T. J. Muehlbauer, of Sheboygan; G. A. Nelson, of Waupaca; Henry Nutzhorn, of Osseo; M. L. Olander, of Superior; R. R. Reed, of Rhinelander; E. R. Schilling, of Minocqua; Win Suits, of Medford; R. E. Wareham, of Baraboo; B. A. Weichmann, of Wausau; C. A. Winter, of Port Washington; and L. F. Winterburn, of Lone Rock.

Association of Southern Boards.

The annual meeting of the Association of Southern Boards of Pharmacy was held at Birmingham, Ala., May 18th. The association approved a plan for securing uniformity in the examinations of the boards represented. There was also some discussion of the reciprocal interchange of licensure, but no definite action was taken.

Officers were elected as follows: President, F. W. Ward, of Nashville, Tenn.; vice-presidents, C. P. Kearfoot, of Virginia; S. E. Bayne, of Georgia; R. H. Walker, of Texas; and D. W. Ramsaur, of Florida; secretary and treasurer, L. C. Lewis, of Tuskegee, Ala.; executive committee, I. B. Clark, of Tennessee; W. S. Elkin, of Georgia; and T. A. Miller, of Virginia.

This is the way the *New York Times* describes a well-known character: Dr. H. W. Wiley, who has done so much to protect the American people from poisoners—and who would have done so much more had not the well-earned enmity of those whose fraudulent profits he diminished succeeded in depriving him of a part of his power to protect the public.

Obituaries.

SAMUEL W. RICHARDSON.

Samuel William Richardson, pharmacist at the United States Marine Hospital in Chelsea, Mass., died there May 11th.

Mr. Richardson was born April 19th, 1850, at Rochester, N. Y., was educated in the public schools of that city and also spent a year at the University of Notre Dame at South Bend, Ind. He enlisted in the United States Army when a young man and served for fourteen years in the infantry and later was in the medical department. He served under General Crook, ending that service in 1881. He was in various Indian campaigns and then became a member of the public health and marine-hospital service, with which he had continued to be connected during most of the past thirty years.

Mr. Richardson was married in 1873 to Emma Cornelia Butler. He is survived by a son, William Butler Richardson.

J. FRED. KIEDAISCH.

J. Fred Kiedaisch died May 9th at his home in Keokuk, Iowa, after a lingering illness. He was 73 years of age and was probably the oldest druggist in point of service in the State, having been continuously in the drug business in Keokuk for fifty-four years.

He was born in Wurtemberg, Germany, and came to this country at the age of fourteen. After spending several years in the drug business at Portsmouth, Ohio, he located at Keokuk in 1857 and worked to the time of his death in the same store, becoming the president of Wilkinson & Company, a corporation operating a wholesale drug house and the largest retail drug store in Southeastern Iowa, and was also senior partner of J. F. Kiedaisch & Son, who conducted another large retail store at Keokuk.

Mr. Kiedaisch was vice-president of the State Central Savings Bank and held many other positions of honor and trust. He had a wide circle of acquaintances in the Middle West. He survived his wife but a few months. Six sons, J. Fred, Jr., G. Arthur, Walter C., J. Albert, Karl and Edward, and two daughters, Lydia F. and Marie M. survive.

HENRY H. STAFFORD.

Henry H. Stafford died at Newton, Mass., April 26th aged seventy-eight years. In 1850 he entered the drug business with Joseph Kldder, of Boston, going to Michigan in 1856, where he opened the business now conducted by The Stafford Drug Co., at Marquette, in 1859. He was one of the best known druggists of his day.

DR. RICHARD SAPPINGTON.

Dr. Richard Sappington, of Baltimore, the oldest physician and the oldest druggist in the actual practice of his profession in the city, died May 14th at his home in Waverly, a suburb, at the age of nearly 84 years.

Dr. Sappington was a son of Dr. John Sappington and was born in Darlington, Harford county, Maryland, in 1827. He was named after his grandfather, a surgeon in the Continental army during the revolutionary war. He attended the Darlington Academy, where he got the rudiments of a classical education, and in 1846 went to Baltimore and at once became an apprentice in a drug store, which was at that time the only way to learn the business, the Maryland College of Pharmacy not having been established. In 1848 he bought the stock and fixtures of a drug store on Pennsylvania avenue and removed them to Gay and Aisquith streets. While conducting the store there he attended lectures at the University of Maryland, School of Medicine, where he was graduated in March, 1851.

Altogether Dr. Sappington was engaged in the drug business for 64 years. In later years he had as a partner his son, Reginald Power Sappington. He was personally known to practically all of the older members of the drug trade, and they held him in the highest esteem.

JOSEPH P. URBEN.

Joseph P. Urben died at his home in Mt. Lebanon, Pa., April 30th, in his sixty-seventh year.

Mr. Urben was one of the organizers of the Western Pennsylvania Retail Druggists' Association, and also of the Pittsburgh College of Pharmacy. He retired from the business in 1905. He was married January 16th, 1868, to Mary Elizabeth Lake, of Pittsburg. Mr. Urben was prom-

inent in civic affairs, having been one of the active members of the South Hills board of trade. He was a member of St. Joseph's Catholic church.

Following are recently reported deaths of other persons in the pharmaceutical world:

MARCUS L. BLANCHARD, at Delmar, N. Y., April 20th, aged sixty-nine years.

JOHN T. BOND, at Tamaqua, Pa., May 16th, aged seventy years.

WILLIAM H. CONGER, in this city, April 20th, aged fifty-four years.

ALFRED F. FELLOWS, at Newton, N. J., May 18th, in his seventy-eighth year. He had been in business at one address for about forty-five years.

CLINTON GILSON, at Portland, Me., May 8th, aged forty-three years.

ALBERT GOODER, at Brookville, Pa., April 23d, aged forty-five years.

JAMES FRANKLIN HAYES, at Philadelphia, May 12th, aged sixty years.

REINHOLD OTTO HOEFLE at St. Louis, April 21st, aged twenty-nine years.

CHARLES G. HORNUNG, of Washington, D. C., at Blauefeldt, near Wurtemberg, Germany, in May. He was in his forty-third year.

GEORGE H. HUMMEL, at Blissville, N. Y., May 20th, aged thirty-five years. He was chief pharmacist at the hospital of the Post Graduate College, this city.

WARREN A. SPALDING, at New Haven, Conn., April 14th, aged sixty-seven years.

J. B. WEBB, at De Witt, Ia., April 12th, aged seventy-one years.

J. J. WHITTIN, at Concord, N. H., March 6th, aged forty-nine years.

LEO WIGHT, at Uniontown, Ky., April 18th, aged thirty-five years.

The body of Dr. William Gray, an aged and wealthy druggist of Washington, D. C., who disappeared March 1st, was found in the Chesapeake and Ohio canal on April 30th by some boys. It was at first thought that Dr. Gray might have been a victim of foul play, but a gold watch and other valuables intact on the body disposed of this theory. He was 75 years old and left a Washington hospital on March 1st with a large sum of money. He was rather eccentric and for some days his family gave themselves no concern as to his safety, thinking he had gone on a visit to another city.

D. J. Puffer, president of the Puffer Manufacturing Company, of Boston, Mass., died at his home at Medford, May 22d.

An Anti-Sampling Law in Ohio.

The anti-sampling bill, which was furthered by the National Association of Pharmacologists in the Ohio legislature, has passed both branches without a dissenting vote.

The bill prohibits the distribution of samples of "patent medicines" and of all other drug preparations which are dangerous to health.

Prior to the passage of this law the author, P. A. Mandabach, had collected a list of 14 deaths of children from samples in a period of about five years.

In celebrating their thirty-fourth anniversary during the week of May 22d, Stoddart Brothers, of Buffalo, N. Y., offered many bargains in every department of their large store. Ice cream and soda water were sold at half price, with strawberry shortcake free, and there were free packets of lavender flowers, talcum and other summer specialties.

So high is the temperature of Miss E—M—, a fever patient, that the bulbs of three thermometers placed beneath her tongue by physicians burst after the mercury had registered the highest figure on the graduated scale.—*Chicago Daily News*.

F. W. Heyl, of Philadelphia, has been appointed special federal examiner of drugs, medicines, and chemicals at that port.

P. C. P. Again Plays Better Ball Than N. Y. C.

Just as if to prove that luck had nothing to do with the outcome of the two preceding games the baseball team of the Philadelphia College of Pharmacy a third time trounced the ball-tossers from the College of Pharmacy of the City of New York in the ratio of 13 to 6. This game was played at Philadelphia, May 6th. Offensively the teams were quite evenly matched, but the porous gloves of the New Yorkers let the Quakers get through for many of their baker's dozen runs.

Among the spectators none were more enthusiastic than the trustees of the United States Pharmacopoeial Convention who had been in session at Philadelphia earlier in the week.

A report from the Bahama Islands has it that the world's largest sponge has been collected there. This adjunct of Neptune's bath resembles in shape an immense fruit-cake, being 6 feet in circumference and about 2 feet in diameter in every direction. When taken from the water it weighed between 80 and 90 pounds. After being dried and freed of all excrescences it weighs about 12 pounds. This immense sponge had no permanent attachment, being known as a "roller," and acquired its spherical shape by being tossed about by the waves.

"Sorry," said the constable, "but I'll have to arrest ye—you been drivin' along at the rate of fifty miles an hour." "You are wrong, my friend," said the driver. "I say I wasn't and here's a ten-dollar bill that says I wasn't." "All right," returned the constable, pocketing the money. "With eleven to one against me I ain't goin' to subject the county to th' expense of a trial."—A waif.

Obliged, because of the increasing volume of his business, to seek larger quarters, J. B. Bond, Jr., of Little Rock, Ark., has moved his wholesale establishment to 113 East Markham street, that city.

The Mexican Chemical Society is making an effort to have a federal school of chemistry and pharmacy established at Mexico City.

"Has the doctor a large practice?" "So large that when people have nothing the matter with them he tells them so."—*Pittsburg Post*.

NEW YORK, JULY, 1911.

WHOLE NUMBER 655

Prohibition of the Word "Cure" Illegal.

Called upon to construe a passage in the food and drugs act concerning the meaning of which the officials appointed to enforce the act and some of those whose businesses were affected by its provision were at variance, the supreme court of the United States has decided in favor of the manufacturers and against the officials. The point at issue was whether or not the prohibition in the law against "false and misleading statements" on the labels of medicines was intended to apply to statements concerning the therapeutic efficacy of the drug; or, in short, whether the government could prohibit the use of such words as "cure" as part of a label, as it succeeded in doing in the famous Harper "cuforhedake brane fude" case, as a result of a criminal suit, and as it has done in a number of other cases, which were not contested. With three justices dissenting, the court held that the phrase "false and misleading" was intended by congress to apply only to statements concerning the composition of foods and drugs and not to predictions as to what the effects of the drug would be.

The language of the statute is as follows:

Sec. 8. That the term "misbranded," as used herein, shall apply to all drugs or articles of food, the package or label of which shall bear any statement, design or device regarding such article, or the ingredients or substances contained therein, which shall be false or misleading in any particular, and to any food or drug product which is falsely branded as to the State, territory or country in which it is manufactured or produced.

In the regulations adopted by the secretaries of the three departments of the government to which the administration of the law was assigned we read:

The use of any false or misleading statement, design or device shall not be justified by any statement given as the opinion of an expert or other person [etc.]

In delivering the majority opinion of the court Justice Holmes said that congress would hardly attempt to make an interstate shipper criminally responsible for mistaken praise, and pointed out that the language of the act itself seemed to refer to actual ingredients of drugs rather than to their effect. If by the words "false and misleading" in the act, every possible false and misleading statement were included, then why, asked the court, did the makers of the law deem it necessary in the same paragraph to specify a prohibition as to false and misleading statements regarding the place of the manufacture of the remedy; and, again, if they had in mind a prohibition of false and misleading statements as to the therapeutic prop-

erties of a drug, why did they not provide for referring any question which might arise in this connection to physicians rather than to chemists, the latter being trained to separate and identify the ingredients of a preparation, but not to pass upon its remedial properties?

While the view of the case indicated by these questions was taken by a majority of the court, this line of reasoning did not convince Justices Hughes, Harlan and Day. A dissenting opinion was filed by Justice Hughes, and no one can read its clear-cut language, follow its cogent reasoning, and study its analysis of the history of the section of the law under consideration without being impressed by the fact that there are two sides to the case, and reflecting that our judges have extremely nice points to decide. Said the learned justice: "If congress had intended to restrict the offense to misstatement as to identity, it could easily have said so. But it did not say so," and again: "If false and misleading statements regarding such articles were put upon their labels, was it not the intention of congress to reach them? And was it not for this very purpose that the general language of section eight was used?"

Put in this way it would seem that to these questions there could be but one reply, yet by a two-thirds majority the court negatived what seems to be the obvious answer. As to their legal correctness in so doing it is not for us to pass judgment, but we believe, and our belief, we are sure, is shared by manufacturers of high-grade goods, that in deciding against the government they indirectly helped the cause of honest dealing in the drug business by showing the necessity for a strengthened food and drugs act. Until the act has been strengthened with respect to the point raised, we are in no worse position in the matter of false and misleading claims for drugs than we were before the passage of the law, and we are in a much better position in a great many other ways.

Food and Drugs Law Needs Strengthening.

According to the old story, the Irishman who laughed at the joke he was going to play on the angry bull, and then tried to rub the animal's nose on the ground, with a result which may be left to the imagination, sagely observed, when he recovered his breath, that it was well that he had had his laugh first, as otherwise he would not have had it at all.

We are reminded of this well-known and well-worn yarn by the attitude of those who are hilarious

over the recent decision of the supreme court of the United States in the Johnson "cancer-cure case". Evidently they think that they have "put one over" the officials of the department of agriculture—and they have. Let them laugh now, while they may, for the time for the aforesaid officials and the better men in the trade and the general public to laugh is coming on apace. The supreme court having decided that the food and drugs act does not confer authority upon the executive officers of the government to prevent the use of extravagant praise of the curative properties of a medicine upon its label, all who wish may now proceed to call their preparations "cures," no matter what chemists say as to their inertness, and regardless of the protestations of physicians that the diseases for which the "cures" are extolled are incurable.

In a way this seems unfortunate, yet we take the view that it is a blessing in disguise, for it is a sort of "last straw" that will cause congress to amend and strengthen in many ways the admittedly weak and inadequate law which we now have. Ever since the passage of the law prohibiting "false and misleading statements" on the labels of drugs, there has been some question in the minds of many thoughtful people as to the propriety of delegating to an official board the authority to decide, under a non-specific law, what therapeutic statement may appear on a label and what may not. Manifestly the just way is to have the law so specific on the question of labeling that questions growing out of the exercise of judgment can not rise under it; then all will know what their rights and privileges are without consulting the regulations of executive officials or waiting for decisions of the judiciary.

By settling once and for all time the question at issue between the department of agriculture and those proprietors of medicines who would make extravagant claims as to the curative properties of their wares, the supreme court has cleared the way for an amendment to the law which will do away with any ground for differences of opinion, and the amended law will undoubtedly be couched in such language that medicine manufacturers will know just where the dividing line is between what they may say and what they must refrain from saying. And no doubt, too, the amended act will be precise as to what is meant by a label: it would be well to have the law so drawn as to include in its definition of labels, the wrappers, circulars, cartons, etc., of the medicine, or better, for it to go so far as to extend the prohibition of "false and misleading statements" to all printed matter to be used for the purpose of advertising it.

President Taft himself has officially recognized the necessity for a better law, and in an emergency message to congress has called upon that body of law-makers to remove "an evil which menaces the general health of the people" and "strikes at the life of the nation." That the chief magistrate of our country should take cognizance of the fraud so long practiced with impunity by nostrum fakers, and make it the subject of a special message to congress, means more

for decency in medicine than we are able to express and perhaps even more than we are able to realize. It is a sign of the times which means that the people are becoming more enlightened and are no longer to be deceived by the cruel lies in "patent"-medicine almanacs and the crafty sophistry in "red clause" newspapers. Senator McCumber and Representative Sherley have already introduced bills in congress to amend the food and drugs act, and the chances for the passage at this session for a law embodying the president's views seem good.

How Wisconsin Regulates the Label.

As if to cheer up those who may be cast down by the decision of the United States supreme court in the Johnson case, discussed in this issue, comes some reassuring news from the good State of Wisconsin. That Commonwealth, like many or most others in the Union, has a food and drugs act of its own, which act is intended to prevent, among other things, deceptive statements on labels of foods and drugs.

In 1908 the United States department of agriculture decided that the product commonly known as glucose was not misbranded if labeled "corn syrup." The food commissioner of Wisconsin refused to be guided by the federal decision, and proceeded against several dealers for selling glucose as "corn syrup." His action was sustained in the circuit court and the action of that court was affirmed in the supreme court of the State, as was mentioned at the time, in the CIRCULAR for September, 1910, page 452. In our report of the case we printed a portion of the opinion of the highest Wisconsin tribunal, which will bear repetition. It follows:

Nor can it be said that the great mass of persons understand that "corn syrup" is a mixture of glucose and syrup. The natural result of such use of the term "corn syrup" is to mislead the consumers into the belief that they are obtaining a table-food of the variety and kind commonly known as syrup, the product of sugar-producing plants, and the consequences of such practice are that the consumers are misled and deceived in the respects as to the actual nature, the constituents and the value of the article as a food product.

The manufacturers of glucose did not accept this opinion as a final blow to the "corn syrup" business in the State in question, but at once brought pressure to bear to have the law changed. They refused to ship their product into Wisconsin, and withdrew most of their advertising from the newspapers there. Then, early in the session of the legislature this year, two bills to change the law were introduced. One of these was withdrawn, but the other came up for final reading in the house, when it was defeated by the decisive vote of sixty-eight to twenty-two.

If glucose is a good thing for people to eat, why should it not be sold under its own name? If it is not a good thing for people to eat, it is not made better by reaching them under a deceptive label. Evidently the executive and judicial branches of the government of Wisconsin take this view, and the legislative has now shown an equal regard for the rights of the people. The latter are to be congratulated upon the

firm stand against deceptive labels taken by their officials, and the examples of these men ought to strengthen the advocates of honesty everywhere. It is confidently believed that the federal law will soon be so amended as to afford fuller protection to the public. Meanwhile, as we have before pointed out, the individual States can have all the protection under their own laws that they want. At best federal law can regulate only foreign and interstate traffic and transactions in certain federal territory. The States must protect themselves against adulteration and misbranding done within their own borders.

Reform Needed in Our Pharmacy Schools.

After a dozen years of the existence of the American Conference of Pharmaceutical Faculties, and after something like half that number of years of effort on the part of the educational authorities of this and other States to separate the reputable from the other kind of colleges of pharmacy, and after there has been prescribed by many of our States a minimum amount of education which a student must have before he can enter a college of pharmacy, and by at least two States a minimum number of hours he must attend lectures and do laboratory work before he shall be entitled to his diploma and be privileged to come before the board of pharmacy for examination for license as a pharmacist, what do we see? We are treated to the humiliating spectacle made by college-of-pharmacy graduates, many of them doctors of pharmacy, and all of them with at least four years of experience in prescription pharmacies, giving most absurd or inane answers, or failing to give any answer at all, to board questions which any intelligent boy who has been working as a messenger or porter in a drug store for twelve months ought to be able to dispose of as a matter of course by putting to use his mother wit and the information he has absorbed by contact with drugs and druggists. When we consider the fact that "doctor" means a learned man—literally, one who is qualified to teach—and that to become a doctor of pharmacy one must take a three years' course at college, the question must naturally arise, What kind of standard can there be in a college which confers this degree upon a candidate who shows the lamentable ignorance revealed to board examiners by some who have received it? How long will our really learned men in pharmacy, the real doctors and leaders and teachers permit this travesty upon education? Whether or not the requirement that a young man to become a registered pharmacist must be a college graduate is a good one, we are not now considering. That is another story. But it may safely be asked how much better is a college that takes poor material, forces it through a certain course and labels it "Graduate in Pharmacy" or "Doctor of Pharmacy," than a manufacturer who mixes spoiled tomatoes, sodium benzoate, red anilin dye and a few other things and labels the product "Pure Tomato Catsup." Both turn loose upon the public a misbranded article which threatens the public's health and even life—and

just here is where boards of pharmacy do good work as public inspectors and public protectors.

Elsewhere in this issue we publish the questions asked by a board at an examination of candidates for licensure as pharmacists, and some answers. The examination is a "stiff" one we admit. We go further and say that we believe that some men who are excellent pharmacists would make a rather low percentage on many of its questions. But before anyone says that the examination questions are too hard, let him consider that they were intended only for graduates of reputable colleges of pharmacy. The point we make, however, is not that certain college graduates failed to pass this examination as a whole, but that they showed such woeful lack of ordinary intelligence in some of their answers—or lack of answers. A man need not be a pharmacist in order to frame an intelligent reply to the question, "Is there any difference in the weight of a pound of cotton and a pound of lead?" yet we see a graduate in pharmacy, and also a doctor of pharmacy, turning in blank sheets instead of answers to this question. The weight of a bushel of wheat having been given as sixty pounds, the examiners asked, "How many bushels are contained in one hundred and fifty pounds of wheat?" and the same two men, who have not only college diplomas—degrees, if you please—but four years' experience each in the practice of pharmacy, are struck dumb by the intricacies of the problem presented! If this were all, we should draw the mantle of charity and say the boys were "rattled"—were in too much of a hurry—or something like that, but this is *not* all; they showed equal inability to answer questions of other and widely varying natures.

While the examiners prepared a hard set of questions, they were very lenient in grading the papers received; sometimes even going so far as to give perfect marks (as to portions of their papers) to each of two candidates who gave irreconcilable answers to the same question; so on the whole it may be said that it appears that the candidates fared about as they deserved at the hands of the board.

To comment on the details of the examination and the answers which we have published would consume more additional space than we feel justified in giving to the subject: these details are now before our readers and each may reach his own conclusions as to conditions which they reveal and his duty in the matter of bringing about an improvement in these conditions. But we cannot let this opportunity pass without congratulating the State of Pennsylvania, and especially her pharmacists, upon having a board of pharmacy that rises so fearlessly to the occasion, and in reply to the criticism in our May issue, says: "This is what we have done; we have nothing to conceal; let the world look into it and say whether or not the fault found lies in us." We believe that much good will result from the action of President Emanuel and his fellow board members in offering for publication the details of their methods of rating candidates, and we hope other boards will follow their example to the end that a much needed reform may be wrought; and

if some of the colleges show their examination questions and the answers given by a few students who pass and a few who fail, so much the better for pharmacy.

PUBLICITY FOR PHARMACOPŒIAL WORK has not been forthcoming to any appreciable extent during the first year of the work of the committee of revision of the United States Pharmacopœial Convention, but such deductions as may be made from the first annual report of the treasurer of the present board of trustees of the convention seem to indicate that the promise of the completed Pharmacopœia in two years from the adjournment of the convention in May, 1910, may be fulfilled. Comparing some of the items of expense ten years ago with similar items for the present decade we find figures as set forth in the accompanying table:

	Year. 1900-1.	Year. 1910-11.
Revision.		
Clerical	\$929.85	\$1,847.50
Supplies	159.35	1,140.97
Experts		52.60
General	759.44	112.67
Meetings		13.89
Postage and telegrams.....		146.88
Total	\$1,848.64	\$3,314.51

Now let us apply the rule of three: If by expending \$1848.64 the first year the 1900 committee of revision completed its work in 5 years, then by expending \$3314.51 the first year, the 1910 committee should complete its work in 2 years and 8 months. The conclusion pointed to by these figures is that copies of the ninth revision of the United States Pharmacopœia should be ready for distribution in about a year-and-a-half from now—say January first, 1913.

MANY CLERKS OF TO-DAY WILL BE PROPRIETORS soon, and we can prove it. According to the most trustworthy statistics available, the annual average death rate in this country is fifteen per thousand. The number of proprietors of retail drug stores in the country is believed to be approximately forty-five thousand. Assuming that the death rate among druggists is the same as it is among the people generally (offsetting the lack of deaths from infantile diseases in their ranks by the increased proportion of deaths from senile troubles), the number of drug store proprietors who die in the United States each year is about six hundred and seventy-five. Many proprietors go out of business voluntarily or for causes beyond their control without waiting to be taken out of it by death; and when druggists die or retire from business their stores, as a rule, are not discontinued, but are conducted by successors. All this means that probably over a thousand—maybe four or five thousand—druggists in business to-day will be out of business this day one year from now. It also means that their places will be filled, in the main, by young men who are clerking to-day. In other words, basing our calculation on the very conservative estimate of one thousand druggists who will make room for others during the ensuing twelve months, to say nothing of those who will create junior partnerships in their business, out of every forty-five men clerking in drug stores this year, one will be a proprietor a year hence. We believe one out of every twenty would be nearer the truth. The question of most importance to the young men themselves is, Which one will it be? That

question can not be answered off-hand, but it is a safe guess that, other things being equal, it will not be the one who, when a disagreeable task is to be done, holds back in the hope that it will fall to the lot of one of the other clerks; or the one who, on the ground that he was not hired for that purpose, refuses to do a thing which ought to be done; or the one who, in order that he may read a paper and smoke a cigarette, makes some excuse to get out of the store during business hours; or the one who is a fast worker or efficient salesman when the eye of the proprietor is on him, but who neglects his work or waits upon his trade in a slovenly and indifferent manner when the proprietor is not looking; or the one who shirks all responsibility; or the one who wastes his money; or the one who spends his nights and time "off" in demoralizing company; or the one who does not love the business in spite of its "long hours" and many "small" features. And in case, on account of other things not being equal, one of the kind mentioned should be the one in the forty-five or the twenty to step out of the ranks of clerks to join the proprietors, the chances are that he will soon be found among those proprietors who will be forced out of business by another year or so. What we have said is not intended to be "preachy"—it is just a collection of facts, deductions and prophecies which may be worth a moment's reflection on the part of some of the young men who are striving to advance themselves.

WHAT IS "LOVE POWDER"? may yet become as burning a question as the famous "What is whisky?" The newspapers report that a Louisiana druggist has been convicted through prosecution by the board of health of that State under the food and drugs law for selling prepared chalk under the name so potent in the relief of heartache. What would the board have had the poor man dispense?

DAILY NEWSPAPERS GET RAPPED so often by the technical press—and deserve rappings so much oftener than they get them—that it is a genuine pleasure to us to reprint elsewhere in this issue a little editorial note from the *New York Globe* and to commend the *Globe* for its utterance. The subject treated is the selling of wood alcohol for whisky, and—but read the note and see.

SARCASM may be all right in a court trial or political debate, but the salesman who uses it in dealing with the public upon whom he depends for his living is a candidate for the mad house—or poor house.

Speaking of those nostrum proprietors who will profit by the decision of the supreme court that false and misleading statements on labels concerning the curative value of medicines are not barred by the food and drugs act, the *New York Times* says: "The manufacturers of these injurious nostrums consciously injure, for gain, the ignorant and enfeebled and dying. They are worse than forgers and counterfeiters. Yet, under the law, and until it shall be amended, they may resume their detestable business and go scot free."

Why do makers of inks for use in fountain pens put soda foam in it? And if the answer is, "Do they?" our reply will be, Did you ever try to fill a fountain pen?

The Waking of Funeral Row.

BY VICTOR LAURISTON.

Funeral row was the proposition Wilkins the Druggist faced when he bought the Bobney stock and took hold of the Bobney business, after young Tom Bobney had gone to the wall with a financial bang which nearly jolted the wall itself off its foundations.

And Funeral row was a forbidding prospect for anyone young and ambitious. Every business street in every city, large or small, has its bad side—the side where business is poor. Carisford's Main street was no exception; and of all the "dead" side of Main street, the deadest section was Funeral row. Carisford is full of people who think that wealth is easily gained behind the counter; and every retired farmer and broken down workman in the neighborhood who has saved a trifle cherishes the illusion that all he has to do in order to roll in wealth is to rent and stock a Main-street store. This competition has pretty well filled both sides of the street; but even this competition proved powerless to rouse to business life the dark, dull stretch of stores between the Royal Arms Hotel at the southernmost limit of the street and the city market, from time immemorial nicknamed "Funeral row."

Funeral row stared Wilkins in the face. He had bought the Bobney stock, but Bassett, the shoe-man, across the way, had bought the Bobney store. And Bassett proposed forthwith to move from his own old premises to those newly acquired, and leave the bad side of the street forever behind him.

Wilkins protested.

"I can let you have the balance of my old lease," remarked Bassett, obligingly.

"That's not so bad," returned Wilkins, brightening. "How much is the rental?"

"Seven hundred a year," rejoined Bassett, smoothly.

Wilkins gasped.

"Why, the lease you hold calls for only \$450," he exclaimed.

Bassett shrugged his shoulders and smiled benignantly.

"It's the only place vacant on the entire street," he returned, coolly—"that is, the only place outside of Funeral row."

"Would you remodel the front?" suggested Wilkins, tentatively.

Bassett shook his head.

"Not at that price," he replied. "And, if you don't take it at that price," he added, serenely, "you'll have to move down to Funeral row——"

"Then," returned Wilkins, grimly, "I'll move down to Funeral row."

He stalked out without another word. He put on a bold front; but as the prospect loomed up before him, he felt a sinking sensation. Here was he, just starting business on limited capital, shoved ruthlessly into the worst location in town. True, the rent of one of the four vacant stores in Funeral row was but \$275 a year, but—there was no casual trade on which the new druggist so much depends, and to that out-of-the-way section few even of the old, tried customers whose ranks had been so sadly decimated by Tom Bobney's mismanagement would care to come. In a day's time there wouldn't be two score people of the buying class passing the door; and at night—death itself was not so quiet as that long stretch of dark-

ened stores at night, and the sidewalk that fronted them.

Wilkins gritted his teeth, and moved. He took in three dollars and eighty-two cents the first Saturday he was in the new location. At the old Bobney stand, when he was just starting, a Saturday's trade was nearer fifty dollars. The druggist half regretted that he hadn't surrendered to Bassett's exorbitant terms.

And then his anger surged up.

"I'll show them yet," he muttered. Then, sharply, he added, "Jimmie, clear out that front window and get busy with a new display."

After a few moments he went forward to supervise the display. There was really nothing else to do. He expended a deal of care upon the designing of that display—more than he might have expended had there been any certainty that there would be passers-by to see it.

"By the way, Jimmie," he remarked, "people from both sides of the street who go over the river would find it shorter to take this side of the street?"

Jimmie nodded.

"And for people living on this side of Main street, all the way back, to the city limits, this side of the street is the shortest way to the railway depot, and to half the business places in town?"

Again the boy nodded.

Wilkins said no more on the subject. Instead, while waiting for the customers who never came, he did a little figuring. The Bassett lease would have cost him \$700 a year. The present stand was costing him \$275. Where he was he had a larger, better furnished, better lighted store, and one with a modern front. He made no allowance for that, however. The figures he jotted down represented a difference of \$425 a year in the rental. With rapidly flying pencil he chopped this total into a number of smaller sums.

"The trade should come," he muttered.

"Jimmie," he added, without glancing up, "telephone both the newspapers to send their advertising men down here right away."

"Tom Bobney used to advertise," he mused. "He used to tell the people, 'This wet weather's just the thing for coughs and colds,' and he told it to them all the year 'round. Well, we'll show the old stagers a thing or two about advertising."

"And—Jimmie," he added, aloud. "Telephone Mildreth to come right up here—I want to see him about painting some signs—and telephone the Carisford Power Company to send their electric expert. That's all, I think."

"Can't be here for an hour, anyway," commented Jimmie, when the telephoning was done.

"Which one?"

"The electrical man. The others can't be around till morning."

"Oh, all right, Jimmie. You just stay here a few minutes and wait on this great tide of eager customers while I go out for a little stroll. I won't be long."

He paced meditatively to the head of Funeral row, just opposite the market. The piano store there marked the beginning of the dead line. Wilkins sauntered in, and conversed earnestly with the proprietor for some ten minutes. Then, coming out, he passed into the seed store next door. And so on he journeyed down the line—taking mental note of the three remaining vacant stores out of the dozen. After which he called up the landlord over the telephone and had a long and earnest talk with him.

Next morning electric linemen were busily at work all along the front of the block. Over Wilkins' door hung a huge cloth sign with flaring letters, and workmen were painting the woodwork and pillars in glaring tones of red and yellow, defiant absolutely of all the rules of good taste or artistic decency.

"Watch for Carisford's Broadway," shrilled the big sign. "Lights turned on Saturday night."

Bassett, strolling that way, crossed the street and hailed the druggist, who was gazing thoughtfully up at the big sign.

"Hello," the shoe man exclaimed. "Trying to make things go, old fellow?"

"I'm making things come," retorted Wilkins, coolly.

Bassett shook his head mournfully.

"I'm afraid the job's too big for you, old boy," he commented, genially. "Trouble is, you've set up in a dead section of the street. You should have sub-let my old store. It's too late now, though," he added, hurriedly. "Thompson's opening up a restaurant there—he took it for six months."

"He's welcome," returned Wilkins, serenely. "I have the best stand in the city and the best landlord on earth."

Bassett, laughing contemptuously, went his way.

On Saturday night from end to end the long block, once so dark, glowed with a long line of incandescent lights in red and white and blue, the colors fitfully alternating every moment; while over the Wilkins store in the center of the block a huge electric sign flared forth. And, where formerly people had shrank timidly from the darkness, now venturesome wayfarers were actually promenading in the uncanny glare of the illuminations; and every now and then passers-by would drop into one of the stores—and most often into Wilkins'—to buy something, or maybe to inquire as to how he changed the colors of the lights.

And such as stayed at home, reading their evening papers by the fireside, were struck by the outstanding headline, "Carisford's Broadway," upon a full page advertisement, in which were displayed the joint announcements of the nine merchants doing business in Funeral row. Well written, interesting talks they were; and by no means unconvincing.

"Carisford's Broadway" for six months continued, day in and day out, to figure just as strikingly in the advertising pages of both the Carisford dailies; and for six months, night after night, the long line of lights and the huge sign glowed welcomingly where once was darkness, but where now the only darkness was that which told of steadily growing throngs, who, fearful no longer of the shadows that had once haunted that spot, now gladly took the natural shortcut, coming and going.

"The best stand in the city," chuckled Wilkins, long before the six months were up.

At the end of the six months he called a conference of his fellow merchants along Carisford's Broadway.

"The time limit for our experiment has run out," he remarked. "Shall we quit, or shall we renew?"

"Renew!" exclaimed the piano dealer, enthusiastically; and "Renew" echoed each of the others with equal heartiness.

"But," interjected the man from the seed store, "what about the new members?"

"Oh," exclaimed Wilkins, "you mean the man who's starting the grocery at the other end of the line. I had a talk with him to-day and he's perfectly willing to come in on the regular terms."

"I know about him," returned the seed man, "but I didn't mean him. The fellow I was talking about is leasing the store right next to yours. You ought to know him, Wilkins—his name's Thompson and he's been running a restaurant in Bassett's old stand up the street."

Wilkins smiled ever so little.

"I know him," he said, softly. "He's making a good move, too. He's locating right next door to the best stand in the city."

Inside and Outside Work for Honesty in Medicine and Pharmacy.

The pure food and drug laws, instead of resulting from co-operative effort on the part of the medical profession and the retail druggists to reform conditions, are largely due to public resentment of the deplorable conditions mentioned. This reform should have come from the medical and pharmaceutical press, not from *Collier's Weekly*, the *Ladies' Home Journal*, and other non-professional publications.—Dr. F. E. Stewart, in a paper entitled "Shall We Have a Profession of Pharmacy?" published in the *American Journal of Pharmacy* for December, 1910, page 562.

It took nearly fifty years of effort on the part of the CIRCULAR to create enough interest in the subject to make the general public pay any attention to it. Had the CIRCULAR received the support which it deserved from other pharmaceutical journals and from medical journals during the intervening time, there can be little doubt as to what the results would have been by this time. Had the pharmaceutical press, or any great proportion of it, presented a solid front in defense of principles like these it would not have been necessary to have waited until 1905 for such influential journals as *Collier's Weekly* and the *Ladies' Home Journal* to step in and popularize them. Honestly conducted journals lacked adequate means for determining just how great the wrong was. Not until nearly half a century had passed and the CIRCULAR had won recognition as the defender of the interests of the best class of pharmacists, did it dawn on the minds of their editors that the subject was one that deserved their care.—Dr. R. G. Eccles in a paper entitled "Fifty Years of Battling for Pharmaceutical Reform," published in THE DRUGGISTS CIRCULAR for January, 1907, page 15.

In other words, the CIRCULAR started the popular periodicals and the popular periodicals reached the public. Mr. Bok, editor of the *Ladies' Home Journal*; Samuel Hopkins Adams, author of "The Great American Fraud" series in *Collier's Weekly*; and a lawyer, who aided both publications, obtained much of the basic information which they used in their magnificent work, by repeated personal visits to the CIRCULAR office.

Pantopon and the Council of the A. M. A.

The council of the American Medical Association has decided that pantopon is not eligible for inclusion in the association's list of new and non-official remedies. The preparation consists of a mixture of the hydrochlorides of the various opium alkaloids, as extracted directly from the drug, with more or less purification. The council holds that this name does not effectively suggest that the preparation is a mixture of opium alkaloids, as is required by a rule which reads: "In the case of pharmaceutical preparations or mixtures the trade name must be so framed as to indicate the most potent ingredients," and further explains: "It is particularly important that actively poisonous or habit-forming drugs be not disguised under an innocently worded title." The council maintains that the name "pantopon" does not sufficiently protect the public against the habit-forming and other dangers inherent in such mixtures.

The Ethical Consideration of the Prescription.*

BY G. C. DIEKMAN, M. D.

The subject assigned to me on this evening's programme is "The Ethical Consideration of the Prescription." While there can be no question concerning what may be properly designated a prescription, the question of what constitutes a strictly "ethical" prescription is no doubt a debatable one, and I shall not attempt to draw a sharp line between a prescription and an "ethical" prescription.

In general, a prescription may be defined as follows: A prescription is a written formula for a remedy or remedies, with directions to the pharmacist for compounding, and instructions to the patient or attendant for administration.

In the treatment of the subject, I shall confine myself to the prescription as furnished by the physician to the patient, omitting mention of formulas, copied perhaps from the daily papers, and presented to the pharmacist in the form of a prescription, bearing, perhaps, even what purports to be the signature of a physician.

Some have declared a prescription to be non-ethical if written for a proprietary remedy, or if such a remedy constituted one of the components. I do not coincide with this view, believing that much broader principles should govern; without question, many of the proprietary articles, more especially chemicals, of to-day, will become the official ones of to-morrow.

Code Prescriptions.

I believe, however, that no prescription should be written the terms of which are not intelligible to every pharmacist. For example, we have instances like these:

R Rheumatic mixture..... 3 iv.
Sig: One teaspoonful every three hours.

R Migraine powders..... A. B. C. No. 1.
Six powders.
Sig: One when required.

The "A. B. C." in this case stands for acetanilide, sodium bicarbonate and caffeine.

R Migraine powders..... A. B. C. No. 2.
Six powders.
Sig: One when required.

In this case the "A" stands for acetphenetidin.

These prescriptions are only intelligible to the pharmacist by whom the doctor wishes to have them compounded. If by chance they are presented for compounding in another establishment, the pharmacist is compelled to admit his inability to furnish the required article. This always creates the impression that he is less skillful than his neighbor who, by virtue of his understanding with this particular doctor, has no difficulty in dispensing the prescription. Instances of this kind are numerous, and such a prescription, in my opinion, should not be classed among the "ethical" ones.

Deviations from the Terms of the Prescription.

In general, deviations of any kind on the part of the compounder are not permissible, excepting in rare in-

stances. When it seems necessary or desirable to deviate, the pharmacist should use every endeavor to communicate with the writer of the prescription and consult with him in relation to the matter. The use of one chemical for another, as, for instance, the use of quinine sulphate for quinine hydrobromide, or the use of alum for aluminium sulphate is never justified. There are, however, instances where a deviation is desirable or even necessary, as in the following:

R Silver nitrate..... 3 ss
Cocaine hydrochloride..... 3 i
Distilled water..... 3 ii

Mix and label "Eye Wash."

In this instance, the silver nitrate will be decomposed by the cocaine hydrochloride into insoluble silver chloride. Of course, this could be removed by filtration, and a clear mixture be dispensed; such a mixture would, however, contain little or no silver nitrate. If cocaine nitrate is employed instead of cocaine hydrochloride, no chemical change will take place. I am certain that the physician will not take offense if his attention is called to the matter in a proper manner.

Another instance:

R Oil of turpentine..... 3 iss
Glycerin 3 iii
Syrup of wild cherry..... 3 iv
Water..... enough to make 3 iii
Mix.

While this mixture can, of course, be dispensed as written, it would separate into layers. A much more accurate dosage can be obtained by adding a sufficient quantity of an emulsifying agent to emulsify, and thus obtain a mixture which will not separate into layers upon standing. Here again the physician will hardly object if such an addition be made. Many other instances might be cited where the addition of a mucilaginous agent will make a more accurate dosage possible:

A third example:

R Tincture of iodine..... 3 ss
Collodion 3 ii
Liniment of camphor..... 3 ss
Ammonia water..... enough to make 3 iii
Mix. Label "Liniment."

The ammonia water is, of course, immiscible with the collodion and liniment of camphor. Spirit of ammonia used in its place will obviate the difficulty, and I have no doubt that the writer of the prescription will sanction the change. [There still remains, outside of the ethical phase of the subject of course—the risk of injury to the compounder or the patient by the violent interaction of the iodine, ether and ammonia.—Editor THE DRUGGISTS CIRCULAR.] Even in such cases, however, I think it would be only proper that the pharmacist consult with the writer of the prescription if at all possible to reach him. If the physician can not be communicated with, and if the terms of the prescription are deviated from, the pharmacist should notify the physician that a change was made.

Price of the Prescription.

In certain neighborhoods of this city, and I presume in other localities, a prescription is taken to a number of pharmacies and priced. In other words, the prescription is purchased much like one would purchase

* Read at the recent meeting of the New York branch of the American Pharmaceutical Association with the Medical Society of the County of New York, and contributed by the author.

clothing, hats, shoes, etc. It becomes the subject of "shopping." Competition being keen, it happens that some pharmacists allow the prescription to undergo a "cheapening process," either by dispensing a lesser quantity than that called for, or by substituting a cheaper for a more expensive article, or by leaving out the article in question entirely. This condition of affairs is aggravated by some physicians who advise the patient concerning the probable cost of the prescription. When the price has been stated approximately correctly, there can, of course, be no objection to this practice. It, however, often happens that the price stated is far below the actual value of the ingredients, not considering the cost of labor and of incidentals such as containers. In one instance which came to my knowledge, the physician had stated that a prescription containing 15 grains of pilocarpine hydrochloride would cost no more than 35 cents: much less than the actual cost of the salt. After considerable "shopping," a pharmacist was found who actually furnished the article, an ointment, for 50 cents. It is needless to state that the pilocarpine was conspicuous by its absence. Much can be done by the physician to remedy this so-called "shopping."

Refilling of Prescriptions.

In this matter the pharmacist is "between the devil and the deep sea." One physician requires that the pharmacist refuse to refill any one of his prescriptions. Another physician takes the pharmacist to task for refusing to refill a prescription, even in cases where he is expressly forbidden by law to refill it. Then again the general public refuses to believe the statement that the physician objects to the refilling of his prescriptions, scenting a deeply laid plot on the part of physician and pharmacist to exact another fee for consultation. The indiscriminate refilling of prescriptions is, of course, to be condemned. Who does not know of the ergot prescription that is refilled over and over again, so often in fact that the label requires renewing repeatedly? I do not believe it is wise to refill a prescription for anyone other than the person for whom it was originally intended, if the pharmacist is aware of the fact. I am acquainted with a case which occurred among friends of mine, where a child had been suffering from a stubborn cough which refused to yield to the ordinary forms of treatment. A noted specialist of this city was finally consulted, and even then several weeks elapsed before the trouble yielded to treatment. A number of remedies were employed, the last one of which had the desired effect. This last prescription was treasured highly, and has done duty among relatives, friends, neighbors, and others, wherever a child was unfortunate enough to show signs of a cough.

Copies of Prescriptions.

With regard to the giving of copies of prescriptions no hard and fast rule can be drawn. Pharmacists in general are not adverse to furnishing copies of prescriptions in proper cases. This courtesy is often abused on part of the public. For instance, after a certain prescription has been compounded and paid for, it occurs to someone that the price charged was excessive. A copy is immediately obtained and is "priced" in other pharmacies. In these cases the "shopping" is done afterward.

The practice of giving copies which are illegible or unintelligible, a practice which is indulged in by some

pharmacists, cannot be too severely condemned. In a recent case, the following copy was furnished:

R Tincture of opium.
Wine of colchicum.
Sodium salicylate.
Peppermint water.
Mix, and give.

Quantities had been omitted and no directions for administration were given. When the copy was presented for compounding in a near-by city, the pharmacist was, of course, unable to fill it. The patient in this case obtained another prescription from the physician, who becoming incensed at such action refused to any longer patronize this particular pharmacist.

Comment upon the Prescription.

Comment by the pharmacist upon the prescription, either to the patient, or other person, medical or lay, should never be indulged in. There is, in my opinion, no instance where such is necessary or justified. The pharmacist should guard the secrets of his prescription file most carefully, allowing no one access to it, excepting, of course, employees engaged in compounding. The pharmacist should remember that he is hardly qualified to make comment or criticism, even were it wise to do this. Yet at times "fools rush in where angels fear to tread." The public will often ask questions like these: "What is this medicine good for?" or "Is this medicine good for a cold?" In these cases the answer can always be made in such a manner as to avoid absolutely even the semblance of comment or criticism.

A worse offense is permitting physicians to examine the prescription file and to look over prescriptions other than their own. For this there is absolutely no warrant. Fortunately such a condition cannot prevail in a well-conducted establishment and exists only in a few cases. I am certain that the great majority of my pharmaceutical brethren will agree with me on this point.

Age of the Patient.

In my opinion, it is desirable, and in some instances even necessary to indicate the age of the patient upon the prescription. This may be done by simply stating whether for an adult or a child. I will endeavor to show the necessity for this by the following illustration:

R Deodorized tincture of opium..... ʒ iii
Syrup of wild cherry..... ʒ ss
Syrup of senega..... ʒ i
Syrup of tolu..... ʒ ss
Water..... enough to make ʒ ii

Mix; label: ʒ i every four hours.

The dose of deodorized tincture of opium in this mixture is $11\frac{1}{4}$ minims, a proper dose for an adult, but a very large dose for a child. The pharmacist to whom the prescription was presented for compounding happened to be in a position to know that the patient was a child about five years of age. Upon communicating with the physician who wrote the prescription he was informed that *camphorated* tincture of opium was what the physician wanted. Had the pharmacist not known that the patient was a child, serious results certainly would have resulted from the administration of the mixture as originally written for. If the physician had indicated that the prescription was for a child, there would have been no question about the matter. Thus it would not have been

a matter of chance or of good fortune that the error was rectified in time to prevent a serious outcome.

There is much more that could be said on the subject assigned to me. I have endeavored to confine myself to what seemed to me to be the more important of its features.

The Hot Plate: A Handy Drug Store Apparatus.*

By DR. JOSEPH L. MAYER.

It is remarkable that in connection with all the exhibitions and demonstrations of handy drug-store apparatus, mention is never made of the hot plate.

The hot plate is simply a flat sheet of iron which is supported either by a metal tripod, or, if purchased, the best form is that with removable legs.

To avoid rusting of glassware, it is well to place a sheet of very thin asbestos paper on top of the iron. Of course, the heat is an ordinary bunsen burner or any other convenient means.

Among other advantages are the fact that by moving the material being heated, either nearer or further away from that portion of the plate where the flame is, varying temperatures are obtained.

In determining sugar volumetrically, using potassium ferrocyanide in the solution as an indicator, the process is easily carried out by placing the beaker containing the Fehling's solution, etc., on the hot plate, and heating until the liquid boils; and after each addition of sugar solution putting the beaker back on the plate at a point which is just beyond the zone where the solution boils. In this manner very accurate results are obtained.

The hot plate is an invaluable aid in drying glassware.

An attempt to call your attention to the innumerable uses for the hot plate would consume too much time. Suffice it to say that its use presents so many advantages over the method of using a wire gauze, that the wonder is how so many pharmacists do without it.

A New Adulterant of Olive Oil.

Cutolo (*Boll. Soc. Nat. Napoli*) reports that olive oil is adulterated with mineral oil colored yellow by the addition of methylazodimethyl anilin. by the appearance and the taste of the oil this adulteration can hardly be detected; the saponification number, however, is very low and the refractive index is high. An addition of an alkali produces in an oil thus sophisticated a yellow color, an addition of a mineral acid a red color. The author has also examined olive oils which had been adulterated with paraffin oils which were not colored.

Cleansing Platinum Wire Used in Flame Tests.

De Koninck (*Bull. Soc. Belg. Chim. through Sch. Mines Quart.*) notes that when platinum wire is used in flame tests many substances adhere to it tenaciously. When this occurs he recommends that borax be fused on the wire, the bead run along it, then shaken off, and the remainder of the borax volatilized by long heating.

* Read at the 1911 meeting of the New York State Pharmaceutical Association and contributed by the author.

Little Sins at the Prescription Counter.*

By DR. CURT P. WIMMER.

A few months ago a certain newspaper in the city of New York had a large number of prescriptions compounded and analyzed, and 50 per cent. of them were claimed to have been found deficient. This was done for sensational purposes, no doubt. The sensation caused at the time met with the usual fate of being forgotten, if not forgiven—like the straw-fire which suddenly and unexpectedly blazes forth, surprising and startling the onlooker, and then dying out as quickly as it started, and the average mind turns to other subjects and forgets. But to him who goes to the bottom of things, there is a lesson hidden even in a straw fire. It could not blaze were there no straw. Let us then for a few minutes consider what that straw was that furnished food for the newspaper's pharmaco-pyrotechnical display.

We will not say anything at all about the very few cases in which an intentional substitution or gross alteration of the prescription was claimed to have been found (a number so small that the entire so-called "exposure" was, to my mind, a compliment to the pharmaceutical profession rather than a slap), but let us consider causes for some of the smaller deficiencies found in prescriptions.

We might say, in short, that many of the smaller deficiencies are simply due to small negligences which, with persistence and watchfulness, can be overcome and eradicated.

Let us take a simple prescription as an example:

Potassium iodide.....	2.00
Water	50.00
M. ft. sol. Sig: As directed.	

This prescription, upon analysis, should show 3.8 per cent. of potassium iodide, yet, I dare say, that about 50 per cent. of any number of this prescription compounded in different stores would be found deficient in quantities ranging from 3 to 10 per cent. The cause of the deviation lies simply in the fact that not sufficient attention is paid to details in compounding prescriptions. Do we not often forget to counterbalance the powder paper on which the potassium iodide is weighed out? A powder paper weighs about 0.040 grammes, which represents in our case 1.33 per cent. of the weight of the iodide. Do we not laboriously convert the 2 grammes into grains, because we have no metric weights on hand? We use, of course, 15 grains as equivalent to 1 gramme and forget that we should use 15.5 grains, or, better still, 15.432, which deviation represents in the above case no less than 3.22 per cent. of the weight of the salt. But why not have metric weights on hand, and use them? A good set of them can be procured so cheaply!

Do we not put the salt into the 2-ounce bottle and then add water until the level of the liquid is about 2 drams from the top of the bottle? And it never occurs to us that a 2-ounce bottle is not at all a measuring vessel, and holds, in most cases, considerably more than the specified amount. Let it be said right here, that the practice of filling prescription bottles to the top without measuring the liquid in a graduate

* Read at the 1911 meeting of the New York State Pharmaceutical Association. In a few instances our mathematical results are not exactly the same as the author's, the difference not being great enough to affect the general conclusion.—Editor THE DRUGGISTS CIRCULAR.

is a most reprehensible one. One-ounce bottles usually hold about 9 drams; 2-ounce bottles hold about 18 drams; therefore, filling a 2-ounce bottle to the top and calling this a 2-ounce mixture is a guess, and means dispensing about 11 per cent. more volume than prescribed. An accurate measuring vessel is the only apparatus which tells us the exact volume of a liquid: let us use it and get away from guessing.

Again, too many of us consider the cash register a more important piece of apparatus in the store than the balance. How often do we test the balance to see whether it weighs correctly? What care do we bestow upon the weights, those pieces of metal upon which our reputation so often depends? The balance should be examined at least once, the weights twice a year, unless they are properly kept and handled with care and due respect to their importance. I am sure that the various colleges of pharmacy would gladly test weights and scales, if requested to do so.

Other little points could be mentioned. Suppose we have a prescription for 1 ounce of a 2-per cent. solution of silver nitrate. Many of us will simply weigh off 10 grains of silver nitrate and add to it 1 ounce of water, not realizing that in doing so we dispense 9 per cent. more silver nitrate than required. We do not stop to calculate the exact amount of the salt, which in this case is 9.11 grains, nor do we weigh the final amount of solution which should be exactly 455.7 grains. The solution prepared without these precautions will, upon analysis, show 2.14 per cent. of silver nitrate, or 7 per cent. more than prescribed by the physician.

A good deal could be added about the preparation of ointments, the subdivision of powder mixtures, the losses in filtration, etc., but this will be reserved for another occasion.

The object of this paper is not to criticize or condemn. It is simply to call attention to some of our little sins which we can avoid with patience and attention. No law can punish us for them, nor should it be able to do so, for many small deficiencies found by the analysis of a prescription are entirely beyond our control. However, our own moral sense should warn us constantly that the most painstaking accuracy in our work is the only factor which elevates pharmacy to the rank of a profession. The claim that the physiological action of a prescription is not changed by such slight deviation is, while it may be true in most cases, not well founded, for it is not the pharmacist's office to be a judge of the action of a prescription. A physician who writes for a 2-per cent. solution of any salt is entitled to have it so, not 2.20 per cent or 1.80 per cent. strong, and the conscientious pharmacist will use all possible means to prepare it of just the right strength. Unless this is done, newspaper crusades against the pharmacists may become as interesting a sport as "Sunday saloon closing" or "vice" crusades, which, indeed, would be a deplorable state of affairs.

Contact Poisoning by Radium.

Dr. Boetau, a French physicist, died in May from corrosive radium poisoning. During some experimentation with radium his hand had been burned by the substance. The corrosion spread despite several surgical attempts to check it, an extensive area of tissue became involved and death followed several months after the original accident.

Can This Be Even Half True?*

It will be noted with keen interest, we think, that a woman on trial here this week on the charge of practicing medicine illegally said while testifying in her own defense that when she delivered a lecture in a church she increased the likelihood of having a numerous audience by paying the priest or minister in charge of it 10 cents for every hearer present.

The lectures in question, while nominally on the general subjects of health and hygiene, were really devoted to the exploitation of medicaments in the manufacture of which the lecturer is interested, and it is hard to believe that many clergymen could be thus moved to countenance and assist an enterprise medically so heterodox.

When the witness was asked to name those whom she had hired in this way to "drum up" listeners to such advice as she had to give, her lawyer promptly intervened to save her from the necessity to reply, and, as the court sustained his objection to the inquiry, the public's eager curiosity will go unsatisfied.

That seems a pity, for the thing charged either is or isn't done, and the matter is one of sufficient importance to make its clearing up desirable.

Pix Cresol.

Puckner and Hilpert (*Journ. Am. Med. Asso.*) report an examination in the laboratory of the association of a preparation advertised as a germicide under the name of pix cresol. Inquiries had been made regarding its composition. No mention could be found in works of reference of a chemical formula assigned it in advertisements. Two analyses were made, and in each case it was found that pix cresol was a mixture of oxyquinoline sulphate, potassium sulphate and milk sugar. The proportion of the first was approximately 21 per cent. An analysis made independently disclosed the presence of oxyquinoline sulphate and milk sugar, but not of potassium sulphate. These results indicated that pix cresol contains, as its essential ingredient, the substance known under the proprietary name of chinisol. Old specimens of chinisol contained oxyquinoline sulphate and potassium sulphate, while the newer samples of this preparation consist of oxyquinoline sulphate alone. It appears, therefore, that pix cresol is merely chinisol mixed with a large amount of inert substance, namely, milk sugar. In an appended editorial note attention is called to findings of the association's council that chinisol is a "powerful antiseptic" but a "feeble germicide."

Chemistry of Centaury.

Reis (*Apoth. Zeit.*) has found that centaury (*erythraea centaurium*) contains in addition to erythrocentaurin and a bitter principle, called by him erythramarin, a lactone-like substance erytauron, which possesses the empirical formula $C_{10}H_{10}O_4$ and melts at 225–275°. From the waxy constituents of the plant a phytosterol $C_{26}H_{34}O$, melting at 79° could be isolated, while the existence of the glucoside, erytaurin, reported by several investigators, could not be proven. Erythrocentaurin was found to possess the formula $C_{10}H_{10}O_3$; it crystallized from absolute alcohol in colorless prismatic crystals, which melted at 145° and turned red when exposed to the light.

* From the *New York Times* of June 2d, 1911.

Abstracts

An Unusual Powder Smoke Fatality.

Johnson (*Colorado Medicine*) reports an unusual and fatal accident from inhalation of smoke after a blasting operation. Men at work in a tunnel had retired to a safe distance before a blast was set off as they had done several times daily for many weeks, to allow the smoke to clear away. In less than three days nine of a party of thirteen men who inhaled the smoke died of acute pulmonary trouble. A like disaster had never been heard of by engineers in charge of the work. There were many old miners among the men who were working in the tunnel, and none of them had ever known of a similar occurrence. An analysis of the circumstances by Gilbert and Whitman seems to show that the cause of the deaths was the inhalation of nitrous fumes, particularly of nitrogen tetroxide, N_2O_4 , and that these poisonous fumes were formed by the action of the electric power current on the smoke from the burning powder. Although no record can be found of the formation of N_2O_4 in this manner, sufficient has been written on the subject to show the entire reasonableness of this explanation. When nitric acid is exposed to the air or is brought into contact with organic matter or metals it is partly volatilized and partly decomposed, and the oxides of nitrogen are formed, particularly nitrogen tetroxide. The simpler and less poisonous form of this gas is NO_2 . It will be shown that NO_2 was present in the smoke. Only the action of the electric current could then be necessary to convert it into its allotropic or nascent form N_2O_2 . The author calls attention to the possibility that some of the rapidly fatal cases of pneumonia to which miners are subject may be due to nitrogen tetroxide.

Artificially Bleached Flour.

The bleaching of flour with the various oxy-compounds of nitrogen is rather common at the present time. Buchwald and Trembl (*Ann. pharm. through Ann. d. Falsif.*) have used with success Griess-Ilosway's reagent for the detection of such bleaching. The reagent consists of a solution of 0.5 gramme of sulphanilic acid and 0.1 gramme of naphthylamine in 300 c.c. (mils) of 30 per cent. acetic acid, and is applied in the following way: A small quantity of the flour is transferred to a piece of white paper and moistened with three drops of the reagent. A pink or red color produced within one minute indicates that the flour has been bleached by nitrous acid or similar compounds. Unbleached flour gives at times a pink coloration also, but only after having been in contact with the reagent for at least four minutes.

Estimation of Spirit of Camphor.

The Dutch Pharmacopœia requires that when 10 c.c. (mils) of spirit of camphor are shaken with water not less than 4 c.c. (mils) and not more than 4.5 c.c. (mils) of the latter should be necessary to produce a permanent turbidity. Scheringa (*Pharm. Weekbl.*) reports that the temperature at which this test is carried out is of great importance, he having found that the amount of water necessary for producing turbidity increases with the rise of temperature.

Curious Accident with a Catheter.

Wilson (*Boston Med. and Surg. Journ.*) reports a curious accident with a catheter. A young man suffering from typhoid fever had so much difficulty in passing urine that his physician was obliged to introduce a catheter and had to repeat the operation several times. The last time he emptied the basin before withdrawing the instrument, which was of a soft rubber type. On returning to withdraw it he was astounded to find that it had disappeared. He made several attempts to grasp it, but all were ineffectual. The author was called with the idea of immediate removal. He concluded after satisfying himself that the catheter was wholly in the bladder, that, being probably sterile and the patient ill, not much harm would follow leaving it there and that the traumatism attendant upon removal might be the turning point in the critical stage of the dangerous disease. He therefore recommended washing out the bladder daily with sterile water. On the seventh day after the accident, after the physician had washed out the bladder, that organ being partially filled, the patient had a desire to strain and out came the catheter, eye-end first. There was no cystitis nor any other untoward result. The patient made a complete recovery from the typhoid. This accident naturally points out that firm hold should be retained on the catheter as long as it is in use, and also that it would be well if they were provided in making with a collar large enough to preclude passage beyond a certain point.

Hydrogen Dioxide Ointment.

On account of its strong oxidizing action on organic substances solution of hydrogen dioxide, when incorporated into an ointment base very rapidly loses its therapeutic value. According to Sylla (*Deutsch. med. Woch.*) an ointment giving off hydrogen dioxide can be prepared by incorporating pergenol (sodium perborate and sodium bitartrate) with petrolatum. This ointment is very stable. In preparing it 10 to 20 per cent. of pergenol should be used, and water, naturally, omitted.

Potassium Permanganate as a Hemostatic.

Buckle (*Journ. Am. Med. Asso.*) reports a case in which hemorrhage from a surgical wound which had persisted after treatment with the customarily-used styptics was stopped by the application of powdered potassium permanganate. The author had used it on several occasions before on small cuts with good results.

Unguentum Solubile.

As an antiseptic, easily absorbent, non-irritant and water-soluble ointment base Stephan (*Apoth. Zeit.*) recommends a mixture which he has called unguentum solubile. This ointment base is prepared by triturating 3 grammes of tragacanth with 5 grammes of alcohol and adding to the mixture 50 grammes of glycerin and 42 grammes of water. The ointment can easily be washed off. In cases where highly diluted solutions have to be incorporated into the ointment, unguentum solubile anhydricum should be used, which is prepared from tragacanth, alcohol and glycerin only. This base should be prepared only for immediate use.

Liquid Petrolatum as a Mounting Medium in Microscopy.

Coles (*Lancet*) having found that many of his microscopic preparations when stained with anilin dyes and mounted in the ordinary way in Canada balsam, faded or lost some of their color after a variable time, endeavored to find the cause, and, if possible, a remedy. The greatest cause of fading in balsam-mounted preparations is acidity, whether present at the time, or developing subsequently from oxidation of the mounting medium. Canada balsam, it appears, cannot be obtained neutral, in the strict sense of the word, since it contains many resinous acids, and in any case practically all substances of the nature of balsams, oleo-resins, or cedar oil will sooner or later oxidize and become acid, and therefore are liable to cause fading of anilin stains. Liquid petrolatum was suggested as a suitable medium, being considered absolutely neutral and one not liable to change. The following method was finally adopted: A small drop of the liquid is placed on a perfectly clean cover-glass, which has been held over the flame of a spirit lamp to drive off any moisture on the glass, and this is applied to the air-dried film, which is also held for a second considerably above the flame, just long enough to make the moisture disappear. After placing on the slide, the margin of the cover-glass is ringed with Apathy's gum syrup, made as follows: Picked gum arabic, cane sugar, ordinary, not candied, distilled water of each 50 grammes. Dissolve over a water-bath and add 0.05 gramme of thymol. This is tested with litmus paper, and if acid made neutral with sodium carbonate. The gum syrup sets quickly in a warm room and when dry, a coat of Bell's cement is applied. The author gives reasons for considering liquid petrolatum superior to cedar oil or balsam in optical respects.

Detection of Indican in Urine.

Barbeiro (*Policlínico* through *Journ. Am. Med. Asso.*) recommends a 1 in 2000 solution of sodium nitrite as a reagent in testing urine for the presence of indican. Two or 3 drops are to be mixed with 5 c.c. (mils) of filtered urine and well shaken. Then 5 c.c. (mils) of concentrated hydrochloric acid and 2 c.c. (mils) of chloroform are to be added. The tint changes from clear yellow to violet; the chloroform, colorless at first, changes to blue, while the supernatant fluid is dark-yellow, pinkish or violet. Comparison of the findings with this technic and with Obermayer's shows that the chloroform takes up the indigo blue more rapidly and intensely with the former. The rapidity of the technic avoids the formation of indirubin and thus protects against another source of error, but its chief advantage is that the reagent, the sodium nitrite solution, is so easily prepared, so stable and acts so promptly, thus adapting it for every-day routine practice.

Precipitation of Aluminum Hydroxide.

Taylor (*Chem. News*) says that if instead of boiling a solution containing aluminum before adding ammonia to precipitate the hydroxide, the precipitant is added at 66° C. subsequently boiling, the aluminum compound separates in a granular form. This change renders filtration very easy.

Determination of Free Carbonic Acid in Water.

Tillmans and Heublein (*Zeit. Unters. Nahr. u. Genussm.* through *Pharm. Journ.*) finds that accurate results in determination of free carbonic acid in water are obtained by titration of the carbonic acid with lime water or other alkalies, using phenolphthalein as indicator, if special precautions are taken to prevent loss of carbon dioxide. The sulphates, chlorides, nitrates, and bicarbonates of the alkalies and alkaline earths are neutral toward this indicator. The nitrates, chlorides, and sulphates are neutral to rosolic acid, but the bicarbonates react strongly alkaline with this indicator. One milligramme of bicarbonate-carbonic acid neutralizes the acid reaction of 0.25 milligramme of free carbonic acid. Large quantities of free carbonic acid may, therefore, escape detection by Pettenkofer's rosolic acid test, if considerable quantities of bicarbonate are present. Titration of the free carbonic acid with alkali or borax solutions, using rosolic acid as indicator, gives results which are too low, the error increasing as the quantity of bicarbonate present increases.

An Oil Resembling that of Anise.

Heckel (*Compt. rend.* through *Journ. Soc. Chem. Ind.*) reports that a large quantity of the leaves, fruits and fruit-stalks of a plant, probably identical with the *pelea madagascariensis* of Baillon has been recently imported into France from Madagascar and now placed for the first time on the European market. The parts named above have a strong odor of anise and contain 4 to 5 per cent. of yellowish essential oil. The oil is most abundant in the fruit, which somewhat resembles that of *ruta*, but is much larger and uniformly tetrameric. The density of the oil is 0.953 at 15° C., its optical rotatory power is + 32° 22' and its refractive index at 20° C. is 1.51469. It is soluble in four times its volume of 80 per cent. alcohol. No anethol separates on cooling the oil to -18° C., but the behavior towards sodium bisulphite indicates a large content of aldehydes, probably anisic aldehydes.

Salvarsan and "Arsenic Cancer."

Sir Jonathan Hutchinson (*Brit. Med. Journ.*) cites literature and cases indicating that the administration of arsenic creates a proclivity towards malignant forms of growth, which he describes as "arsenic cancer." He utters a warning to those inclined to prescribe salvarsan without due recognition of its possible danger.

Superheated Air in Skin Diseases.

Esau (*Münch. med. Woch.* through *Journ. Am. Med. Asso.*) urges the more general application of superheated air in treatment of dermatoses, declaring that it should at least be given a fair trial before starting a tedious, complicated course of treatment. Stopping the itching is its most grateful effect while in treatment of weeping and scaling skin affections, he says that it is at least as effectual as other measures at our command. One specially interesting feature of the treatment is that when one patch is exposed, other patches seem to feel the benefit, too, and display an evident, though milder, reaction.

Poisoning by Eucalyptus Oil.

Foggie (*Brit. Med. Journ.*) reports a case of serious poisoning by eucalyptus oil. The case was that of a boy, six years of age, who had been accustomed to have a drop or two of the oil on sugar, but was given a teaspoonful by mistake. About four hours afterwards abdominal pain and severe vomiting set in, accompanied by diarrhea. Later the boy became semi-comatose, and could only be roused by very vigorous slapping of the face, and on being roused the vomiting again set in. After two or three hours of external stimulation very much along the lines usually adopted for opium poisoning the comatose condition passed off, and the boy was allowed to sleep. The next morning, beyond being tired, he was quite himself again, although the breath had a smell of oil of eucalyptus for three days. The poison showed itself by gastro-intestinal irritation and cerebral paresis, but there was no irritation of the urinary tract. The author gives a summary of other cases of poisoning by eucalyptus oil which have been recorded from time to time. In these the symptoms have varied greatly according to the amount of oil taken, and apparently also according to the idiosyncrasies of the patient. Incidentally it is mentioned that Davies knew a patient who fainted even at the smell of it. In general, toxic symptoms have been noted after doses of 1 dram or more, but Taylor speaks of a patient who felt a little giddiness and confusion after $\frac{1}{2}$ dram. Most of the cases, however, developed marked toxic symptoms after doses of 1 dram or more. With such different dosage the time of onset of toxic symptoms has naturally varied greatly—from ten minutes in one case to one or two hours in another. In like manner the kind of symptoms and the order of their development have shown differences. Vomiting was generally the first sign, and it was frequently followed by abdominal pain and diarrhea. In most of the cases, whether preceded by gastrointestinal irritation or not, unconsciousness, varying in degree from mere drowsiness to coma, supervened. In some the first symptom noticed was a giddiness. In all but the slightest cases further effects manifested themselves in pallor, quick pulse, and general collapse, as well as frequently respiratory disturbance. No after effects were noted beyond the temporary odor of the breath.

Detection of Subnitrate in Bismuth Salicylate.

Caron and Raquet (*Rép. pharm. through Pharm. Journ.*) propose the following method for detecting subnitrate in bismuth salicylate. The latter nearly always, it is said, contains some of the former. A half gramme of the sample is treated with about 50 c.c. (mils) of a dilute solution of soda, boiled for five to ten minutes, made up to 100 c.c. (mils) and filtered. A known volume of the filtrate (5, 10, 50 c.c. [mils]) according to the supposed content of nitric acid) is evaporated on the water-bath; the residue, which contains a certain quantity of sodium salicylate besides any nitrate, is mixed intimately with 1 c.c. (mil) of pure sulphuric acid, and then 10 c.c. (mils) of water and 10 c.c. (mils) of ammonia are added. The color obtained is compared with that produced by the residue of evaporation of a nitrate solution of known strength treated with 1 c.c. (mil) of a 1 per cent. solution of sodium salicylate, under the same conditions.

Fused Silica Ware.

Bottomley (*Proc. Seventh Int. Cong. Appl. Chem., 1909, through Journ. Soc. Chem. Ind.*) stated that the limits of temperature at which a furnace for the production of fused silica ware can be worked, are very narrow, as the temperature at which the carbon used as resistance material reacts with silica to form carborundum is very close to the temperature required for working the silica. The high viscosity of the silica even at very high temperatures renders it very difficult to get rid of air-bubbles and obtain a transparent product. At the present time charges of 70 lb. of fused silica can be made and the plastic mass is so ductile that it can be drawn to a length of 60 feet or more of $\frac{3}{4}$ in. tubing. Fused silica ware which has been subjected for long periods to a very high temperature tends to become brittle owing to reversion of the silica from the vitreous to the crystalline state. An investigation of this change at the National Physical Laboratory showed that it became evident at about 1188° C., but was not serious even after heating for 8 hours at that temperature. Heating for 4 hours at 1353° C., however, caused a reduction of 40 to 60 per cent. in the strength. Transparent silica proved stronger than the non-transparent material at all temperatures. For short periods, for example, in pyrometric measurements, fused silica ware can be used at temperatures much above 1200° C. Fused silica is a better insulator than glass, especially at high temperatures; its specific inductive capacity is 3.5 to 3.6. The non-transparent material has the specific gravity 2.07, and the transparent, 2.22. The largest article yet made of fused silica is a cylindrical vessel, 2 ft. 6 in. high and 12 in. diameter, with a capacity of 50 liters. A silica tube which has been quenched from 1000° C. for a number of times, gradually becomes porous, so that a vacuum cannot be maintained in it. Silica tubes can be bent and worked at temperatures very little above 1500° C.

Preservation of Diaminophenol Photographic Developers.

Namias (*Proc. Seventh Int. Cong. Appl. Chem.*) says that boric acid acts well as a preservative agent for diaminophenol developing solutions. When 50 grammes per liter are present, the solution can be used after several months, and its reducing power is not impaired to the same extent as it would be by the use of bisulphites. The time necessary for development is only slightly greater than when boric acid is absent, and the quality of the images is unaffected. If potassium bromide is added to the solution, the rate of development greatly decreases, and the contrasts increase, so this is a convenient method for developing over-exposed images.

Precipitate in Fluidextract of Cinchona.

Javillier and Guérithault (*Bull. scienc. pharm.*) have examined the precipitate which is very frequently formed in fluidextract of cinchona after prolonged standing and have found that it consists entirely of calcium quinate. No alkaloids are precipitated from the fluidextract. The authors also report on Yvon's silico-tungstic acid method for the estimation of the total alkaloids in fluidextract of cinchona with which they have obtained very satisfactory results.

The Modern Materia Medica.

Adralgin chirurgicum is a liquid said to contain cocaine thymolsulphonate and adrenalin; *adrenalin dentale* is said to be of the same constitution, the proportion of the active ingredients differing.

Agarophen are tablets containing agar-agar and phenolphthalein.

Antiverminzaepfchen (suppositories) contain naphthalin.

Bardet's Serum is said to contain sodium chloride, phenol, sodium phosphate, and sodium sulphate.

Biofaex-Pillen is another name for *furunkulose-blutgeschwuer* pills.

Calcium Bromo-carbamide is offered as a remedy in heart complaints.

Cantani's Serum is an aqueous solution of sodium chloride and sodium carbonate.

Cebeda Powder is said to consist of powdered Roman chamomile. *Cebeda drops* is an alcoholic distillate said to contain the volatile constituents of cinnamon, cloves, juniper berries, rosemary and Roman chamomile.

Cheron's No. 1 Serum is a solution said to contain sodium chloride, sodium sulphate, sodium phosphate, and phenol. In No. 2 the phenol is omitted.

Choanol, offered for the treatment of rhinitis, contains as chief ingredient, cedar-wood oil.

Crocq's Serum is a solution of sodium phosphate.

Cusylol is a combination of copper citrate and sodium borocitrate.

Digitalis Blomberg is the name for a digitalis preparation, made by infusion from two-year-old plants.

Diglyco-disalicylic Acid is put forward as possessing the full physiological activity of salicylic acid, and having certain advantages over acetyl-salicylic acid.

Dujardin-Beaumetz's Serum is said to contain potassium carbonate, potassium sulphate, sodium lactate, sodium phosphate, and sodium chloride.

Dyspnop Tablets, put forward as a prophylactic in angina pectoris, contain diuretin, agurin and extract of quebracho.

Eisensanguinose contains 1.2 per cent. of iron.

Erdol Prunier, exploited for the treatment of rheumatism and similar diseases, is quinoline salicylate.

Ergotine Blomberg is prepared from fresh ergot by infusion. After the inorganic acids have been removed, glycerin is added as a preservative.

Fichtel's Diabetiker Pulver, exploited for the treatment of diabetes, is said to contain malic acid, sodium citrate, sodium phosphate, sodium bicarbonate, and potassium bitartrate.

Figopur is a laxative syrup of figs.

Fleig's Serum is said to contain sodium chloride, calcium chloride, magnesium sulphate, sodium bicarbonate, sodium glycerophosphate and glucose.

Fritze's Enfettungstee, for the treatment of obesity, which has been described as a preparation of the fruits of dog-rose, whortleberries, elder flowers, senna leaves, peppermint leaves, walnut leaves, horse-

tail, rosemary leaves, sassafras wood and buckthorn bark, contains, according to Zernik, only the extracts of senna leaves and buckthorn bark.

Guajacol Haemofer is a name for *tinctura ferri sulphoguaiacol aperiens*.

Heufieber Salbe (hay fever ointment), contains paranephrin.

Horvell's Serum is said to contain sodium chloride, calcium chloride, potassium chloride, and sodium bicarbonate.

Huchard's Serum is an aqueous solution said to contain sodium phosphate, sodium chloride, and sodium sulphate. *Huchard's concentrated serum* is said to contain phenol in addition to these ingredients.

Hexametin is an effervescent salt containing hexamethylenetramine.

Iodex is the name for an iodine ointment.

Irbitol is a name applied to two entirely different preparations. One is a compound aromatic spirit, formerly called *spirussol*; the other is said to contain salicylic acid with menthol-camphor.

Kranecker and Lichtenstein's Serum is said to contain sodium chloride, and sodium carbonate.

Lactochol is the name for tablets containing milk ferments and decolorized gall extract.

Levurine Extractive Couturieux, marketed in the form of tablets, is said to represent beer yeast.

Lipojodin is the ethyl ester of an iodized unsaturated fatty acid. It has the formula $C_{19}H_{39}Cl=Cl-COOC_6H_5$. It is obtained from erucic acid and contains 41 per cent. of iodine.

Locke's Serum is said to contain sodium chloride, calcium chloride, potassium chloride, and calcium bicarbonate.

Luton's Serum is said to contain sodium phosphate, and sodium sulphate.

Mathieu's Serum is said to contain sodium sulphate, sodium phosphate, sodium chloride, and glycerin.

Megapist, exploited for removing gall-stones, is said to consist of iron chloride, aloes, rhubarb, buckbean, blessed thistle, boldo leaves, buckthorn bark, ammonia, and oil of peppermint.

Menthenon, prepared from oil of peppermint, is said to possess antiseptic properties. It occurs as a liquid with a disagreeable, bitter taste, and unlike oil of peppermint, it does not produce a cooling sensation when applied to the tongue.

Milchlin is a condensed skimmed milk.

Netter's Serum is said to contain sodium chloride, calcium chloride, potassium chloride, and sodium bicarbonate.

Nervacolade Chocolate, a nutritive preparation, is a chocolate containing iron combined with albumin, manganese, calcium glycerophosphate, and ovoid lecithin. *Nervacolade cocoa* contains iron hemaglobin, ovo-lecithin, and calcium glycerophosphate.

Noton are tablets, containing among other ingredients, sodium amidophenylarsinate.

Novoconeprhin contains novocaine and paranephrin.

Novotussin is the name for a saccharated compound extract of sage.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Darkening of Compound Resorcin Ointment.—J. O. F., Illinois.—Many have been the suggestions offered for improving the appearance of compound resorcin ointment. To prevent or retard the change in color W. T. Hankey has suggested the use of anhydrous wool-fat and the addition of about 12 per cent. of starch. A. Hoch has reported that the color change was considerably lessened by the use of the white variety of petrolatum. It must, however, be borne in mind that the laws of most States forbid the sale of "modified" official preparations under official titles.

One of the first things necessary to secure an ointment that will darken but little—the color change cannot altogether be prevented—is to use a resorcin that is entirely free from related phenolic derivatives. The presence of these impurities is responsible for much of the complaint often heard because a resorcin "hair tonic" has dyed the scalp to an Indian tint. A satisfactory resorcin having been obtained, the next consideration is the securing of oil of cade that is nothing more. Then, having assured himself that the petrolatum has not an acid reaction and that there are no evidences of the wool-fat being rancid, the operator is ready to go ahead—but he should not adhere to the official directions.

First the resorcin should be reduced to the finest possible powder—if it acquires a pronounced pinkish tint a new start had better be made with cleaner utensils—the powdered resorcin should be mixed thoroughly with the petrolatum and the paraffin, previously melted together and not quite cooled. The zinc oxide and the bismuth subnitrate—of course they are to be of official quality—having been sieved together, should be incorporated with the wool-fat by slow and careful trituration. Into this ointment the fatty resorcin mixture should be gradually incorporated; the entire batch is then triturated or milled thoroughly, the oil of cade being slowly added the while.

Best Solvents for Sulphur.—"Old Reader," Georgia.—In the absence of any information as to your object in dissolving the sulphur, it seems that the best thing we can do is to refer you to the Pharmacopœia, in which it is stated that this element is "readily soluble in carbon disulphide, petroleum benzin, benzene, oil of turpentine, and many other oils; also in ether, chloroform, and in boiling aqueous solutions of alkali hydroxides." If experiments are made with these solvents it should be noted that all except the last two are highly inflammable.

"Unguentum Cydonium."—H. W., Pennsylvania.—Dermatologists sometimes use the synonym "unguentum cydonium" for a glycerin "jelly" made with quince seed instead of the usual tragacanth. A mixture of glycerin and quince seed mucilage affords practically the same thing. Boric acid and starch are occasionally added.

Opaque Paint for Blocking Out Photographic Negatives.—E. G. A., Pennsylvania.—The parts of a negative which are not desired in the print may be blocked out by painting the glass side of the negative with semi-liquid caramel. Another opaque paint consists of—

Burnt sienna.....	1 ounce.
Powdered acacia.....	2 ounces.
Water	10 ounces.

Any finely-powdered red, brown or black pigment rubbed up with mucilage of acacia will answer. The addition of a little glycerin to prevent cracking is frequently made.

Elixir of Lactated Pepsin.—M. E. M., Pennsylvania.—In the CIRCULAR for January, 1911, page 29, appears a lengthy article about the therapeutic and pharmacal shortcomings of the proprietary and official elixirs of lactated pepsin. Several formulas are given and reference is made to four preceding issues of the CIRCULAR in which other formulas and criticisms appear.

Formulas of this type are legion, and, not wishing to limit you to those referred to above—which may have proved unsatisfactory—we offer the following with which we have had practical experience:

Powdered pepsin, soluble.....	20 grains.
Pancreatin	200 grains.
Malt diastase.....	12 grains.
Lactic acid.....	12 minims.
Hydrochloric acid.....	20 minims.
Milk sugar.....	2 av. ozs.
Tincture of cudbear.....	3½ drams.
Special elixir....	enough to make 1 pint.

Triturate the pepsin with the milk sugar until they are intimately blended; stir in the other ferments and the acids and mix thoroughly. Dissolve the powder in the elixir and add the coloring.

Special Elixir.

Oil of sweet orange peel.....	100 minims.
Oil of citron.....	25 minims.
Oil of coriander.....	20 minims.
Oil of rose.....	10 minims.
Tincture of vanilla.....	2 ounces.
Syrup	2 pints.
Deodorized alcohol.....	2 pints.
Distilled water....	enough to make 8 pints.
Purified talc.....	enough.
Absorbent cotton.....	enough.

Pick into shreds a handful of absorbent cotton and place this in a wide-mouthed covered jar. Drop the oils on the cotton, shaking the vessel occasionally so as to get thorough distribution; add (all at once) a mixture of the deodorized alcohol and 3 pints of distilled water; add the tincture of vanilla. Shake this mixture thoroughly for several minutes at a time, about six times daily for two days. Filter in a covered funnel through double filter paper sprinkled with purified talc. Finally add the syrup and enough water to make the required volume.

Liquid Soap.—"Doctor," New Hampshire.—When you wrote your query you doubtless had not received your copy of the CIRCULAR for June, on page 304 of which appear several formulas, suggestions and references under this head.

Making Hydrogen Dioxide and Other Dioxide Preparations.—L. D., Montana.—Concerns which manufacture hydrogen dioxide in a commercial way guard their individual processes as trade secrets. The usual text-books on pharmacy give the fundamental principles of some of the processes employed.

Peroxide Cold Cream.

Suggestions for making this preparation are given in the adjoining column, in answer to another querist.

Peroxide Tooth Powder.

The right to the use of calcium peroxide and the perborates and percarbonates of all the alkaline earth metals in the manufacture of tooth powders is claimed by one manufacturer, under a patent issued by the United States government. A note on this phase of the subject may be seen in the CIRCULAR for November, 1907, page 737.

An oxygen-yielding tooth powder which does not contain calcium peroxide or any perborate or percarbonate may be made of—

Magnesium peroxide.....	1 dram.
Precipitated chalk.....	6 drams.
Powdered soap.....	20 grains.
Oil of wintergreen.....	12 minims.

It has been said that bactericidal tooth preparations may do harm by destroying beneficent as well as malignant bacteria when used in the mouth.

Peroxide Tooth Paste.

Just to what extent and how long solution of hydrogen dioxide will remain active when combined with other ingredients necessary to form a tooth paste, we are unable to say, but herewith is a formula for a dental cream which calls for that rather unstable ingredient:

Precipitated chalk.....	5 parts.
Powdered castile soap.....	1 part.
Solution of hydrogen dioxide.	
Glycerin, of each.....	enough.
Form a paste, and flavor to suit.	

Converting "Old Style" into the Metric System.—"Constant Reader" is in trouble and comes to us for help. He writes:

Please explain me, the principle, how to convert the following examples, from Apothecaries' system into the equivalent of metric system.

- (1) 0.03 gtt. into cubic centimeter.
- (2) 0.02 gr. into gramme.

There is no absolutely correct mathematical way of converting a certain weight or measure of one system into terms of another system. Bases for such converting are approximately determined by actual experiment; but, of course, when the equivalent of 1 gramme, for instance, in grains has been settled upon, the equivalent of a fraction or a multiple of a gramme in grains may be calculated arithmetically, as may the equivalent of any number of grains in grammes or grammes in grains.

Actual experiment has shown that for all practical purposes 1 gramme is equivalent to 15.4324 grains. Therefore 1 grain is the equivalent, in grammes, to 1 divided by 15.4324, which is 0.0648. Now, if 1 grain is the equivalent of 0.0648 gramme, it is plain that 0.02 grain is equivalent, in grammes, to 2/100 of 0.0648 grammes, or 0.0648×0.02 , which is 0.001296 gramme.

This disposes of the second half of the question, but the first half is not so easy. By "0.03 gtt." is of course, meant 0.03 drop, and as drops vary in size it will be necessary for us to know the size of the drop in question before we can proceed to calculate its equivalent. As no information is offered on this point we must acknowledge our inability to answer this half of the question. However, if it is desired to ascertain the equivalent in cubic centimeters of 0.03 minim, that is an easy matter. It has been settled by experiment that 1 cubic centimeter is approximately equal to 16.23 minims. Proceeding as before we find that 1 minim is the equivalent of 0.06161 cubic centimeters, and 0.03 minim is equivalent to 0.0018483 minim.

In the CIRCULAR for April, part 2, page 147, may be found a useful table of approximate equivalents of metric and old-style weights and measures.

Greaseless "Peroxide" Cream.—S. D. C., New Jersey.—By adding the desired quantity of 30-per cent. solution of hydrogen dioxide to the finished cream made by the process described in the CIRCULAR for May, page 257, a typical "peroxide" cream is produced. A freshly made solution of sodium peroxide may be used instead of the solution of hydrogen dioxide.

Other notes on this subject, with formulas, may be seen in the issues of the CIRCULAR for February, 1909, page 77; and November, 1908, page 566.

Moisture in Boric Acid.—W. C. T., New Jersey. was informed by a traveling salesman that the boric acid the salesman had to offer contained but 1 per cent. of moisture and was therefore to be preferred to the commercial acid which the informant said contained 37 per cent. of moisture. W. C. T. was puzzled to reconcile this information with the text of the Pharmacopœia which describes the official product as containing "not less than 99.8 per cent. of pure boric acid $[B(OH)_3]$," so he sought our aid.

Boric acid U. S. P. (H_3BO_3) contains no uncombined water of crystallization. It does, however, contain something more than $43\frac{1}{2}$ per cent. of combined water of hydration, and loses about 29 per cent. when heated to $100^\circ C$. At this temperature meta-boric acid or glacial boric acid (HBO_2) is formed, and, if boric acid be heated, above $160^\circ C$., it loses all its water of hydration and becomes boric anhydride or boron trioxide (B_2O_3). It is scarcely necessary to say that neither HBO_2 nor B_2O_3 is boric acid U. S. P.

So far as we are aware, boric acid containing uncombined water of crystallization does not exist.

Alcohol Percentage.—Referring again to the query of M. S. G., Pennsylvania (see the CIRCULAR for last month, page 310), it should be stated, although he did not request this information, that when the percentage of alcohol is declared on a label, the percentage of absolute alcohol by volume is meant. This is in accordance with food inspection decision 54, issued by the secretary of agriculture. When a certain proportion of alcohol of less than 100 per cent. strength (as the usual 95 per cent. alcohol, for instance) is used in a preparation, the declaration on the label should not refer to the proportion of the weaker alcohol employed, but to the proportion of absolute alcohol represented by the weaker spirit.

Paint and Varnish Removers.—C. E. H., Iowa.—Some of the more successful paint and varnish removers on the market are covered by basic patents which prohibit the use by unauthorized manufacturers of their principal ingredients, which are alcohol, benzol and wax or their equivalent.

Perhaps you would find a preparation made according to one of the following formulas efficacious:

I.

Flour (or wood pulp).....	385 parts.
Hydrochloric acid.....	450 parts.
Chlorinated lime.....	160 parts.
Oil of turpentine.....	5 parts.

This mixture is applied to the surface and left for some time. It is then brushed off, and brings the paint away with it. It keeps moist quite long enough to be easily removed after it has acted.

II.

Sodium hydroxide.....	5 parts.
Solution of sodium silicate.....	3 parts.
Flour paste.....	6 parts.
Water	4 parts.

III.

Soap	10 parts.
Potassium hydroxide.....	7 parts.
Potassium silicate.....	2 parts.

IV.

Sodium hydroxide.....	3 pounds.
Whiting	4 pounds.
Flour	1 pound.
Water	1/2 gallon.

Dissolve the sodium hydroxide in part of the water and mix the whiting with more water to form a cream. Add the sodium hydroxide solution to the whiting cream, then mix in the flour made into a paste with the rest of the water.

For use, 1 pint of this solution is mixed with about 2 gallons of water.

A note on this subject embodying other formulas, some of them quite different from any of the foregoing, appears in the CIRCULAR for March, 1910, page 123.

Face Powder.—A. K. P., New Jersey.—A "healthful" face powder, we fear, does not exist. While a simple powder may in many instances conduce to bodily comfort by protecting the skin from the injurious effects of sun or rain, the least harmful of powders will upon continued application exert a pernicious influence upon the skin. The injurious effects of a face powder consist chiefly in the formation of comedones due to the clogging of the dermal pores by a mass formed of the powder and the sebaceous secretions. The more injurious effects are due to the use of a salt of lead or bismuth as an ingredient, the absorption of which gives rise to systemic poisoning by the metal. Powders made with a base of talc or kaolin are perhaps the least injurious. These substances are less absorbent than the starches and also more protective.

Saalfeld gives the following formula for a simple white cosmetic powder:

Zinc oxide.....	215 parts.
Finest talc.....	345 parts.
Heavy magnesium carbonate.....	35 parts.

This may be perfumed as desired and colored; so-

lution of carmine is used to produce a rose tint, and solution of carmine and yellow ochre combined give the brunette tint known as Rachel.

Zinc stearate, or oleo-stearate, is said to be superior to zinc oxide as a dermatological application. Many dermatologists advise against the use of the zinc salts for the reasons given above with reference to the salts of lead and bismuth. In the foregoing formula the zinc oxide may well be replaced with a high grade of white kaolin.

A number of formulas for basic and complete face powders appear in the CIRCULAR for August, 1910, page 416.

Rubber Tire Cement.—I. L., New Jersey.—Cements for thin rubber fabric such as the inner tubes of vehicle tires are usually simple solutions of gutta-percha or scrap unvulcanized rubber in carbon disulphide or benzol; sometimes a little rosin or shellac is added. The first of the following formulas is taken from a previous issue of the CIRCULAR:

I.

Gutta-percha	1/2 av. oz.
Rosin	40 grains.
Carbon disulphide.....	8 ounces.

II.

Scrap rubber.....	1/2 ounce.
Rosin	1/8 ounce.
Beeswax	1/4 ounce.
Carbon disulphide.....	8 ounces.

Digest the rubber in 4 ounces of the carbon disulphide for twenty-four hours; add the rosin, finely powdered and lastly the beeswax mixed with the rest of the solvent.

For cuts or rips in outer tires a heavier cement is necessary, the following being a typical formula:

Gutta-percha	2 ounces.
Caoutchouc	4 ounces.
Isinglass	1 ounce.
Carbon disulphide.....	1 pint.

In handling carbon disulphide or benzol or preparations containing either the fact that both are extremely inflammable should be borne in mind.

A solution of gutta-percha was official in the 1880 Pharmacopœia; the formula may be found in the appendix to the National Formulary.

"Mortification Powder."—A. W., Pennsylvania.—This medicament (?) is a survivor of the day when gun-powder was taken for "that run-down feeling," and no household was considered ready for summer until the members thereof had been "spring-cleaned" by heroic doses of sulphur and molasses and cream of tartar. The powder concerning which you inquire is the analogue for human use of the veterinary condition powder, and has much the same composition; as the constituents of "horse powder" vary considerably with geographical location, so does mortification powder. The following formula was at one time quite popular not a hundred miles from your city:

Potassium bitartrate.....	60 parts.
Potassium nitrate.....	15 parts.
Sulphur	60 parts.
Wood charcoal.....	3 parts.

The ingredients are powdered separately and mixed carefully, the saltpeter being added last.

Oils, Butter, Etc.—D. W., Mississippi, asks some five-and-a-half questions, as follows:

1. What is the wholesale price of coconut oil?
2. What is the price of peanut oil?
3. I notice that *vegetable butter* is being made from coconut oil, a little cream, and yolk of eggs. It sells for 14 cents a pound. Can you tell me (a) how it is made, and (b) whether it could be made on a small scale and sold profitably?
4. What is the scent or perfume called *asfalath*?
5. From whom can the coconut oil be bought?

Our answers to them, as far as we are able to make them, follow:

1. About 8 to 10 cents a pound.
2. About the same.
3. (a) There are many preparations on the market which may be described roughly as "vegetable butter," and some of them contain coconut oil, butter, cream, or egg yolks. Failing to find just the information desired by our querist nearer home, we wrote to the editor of a dairy paper in the cattle belt, and to the editor of an egg paper out West, but could learn nothing of importance on the subject from either of them. We also applied at the department of agriculture and to a well-known patent attorney at Washington. From the former we received this reply:

In regard to the use of prepared coconut oil in the manufacture of a butter substitute, I would say that we do not think the department of agriculture has ever published anything on this particular subject, as such a process is rarely if ever practiced in this country.

Regarding the records of the patent office on this subject, the attorney, William G. Henderson, wrote:

The delay in acknowledging receipt of your favor of the 14th inst., received the 15th, has been occasioned by the time necessary to look up the subject of "vegetable butter" made of coconut oil, cream and yolk of eggs, forming the subject of your inquiry.

I am enclosing herewith copy of patent No. 430,536 to Delia McGregory, which describes a butter compound comprising the yellow portion of eggs added to a proportion of milk and a proportion of dairy butter; also copy of patent No. 489,814 to Messrs. Hudson, Strong and Bunch, which describes a butter compound comprising ordinary butter, sweet milk and coconut oil; and also patent No. 390,682 to Paul Kolesch, which describes a vegetable butter compound comprising coconut oil, palm oil and refined alcohol. These are the nearest patents found to the vegetable butter compound specified in your letter. There are a number of other patents on artificial butter, but none of them is any nearer to what you describe than the patents mentioned above.

The disposition of the patent office at the present time is against the granting of any additional patents on butter compounds. There are some other patents that specify the yolk of eggs as one of the ingredients in artificial butter compounds, but they are not any closer than the patents of which copies are being sent to you.

On the subject of coconut oil or butter, Dr. Harvey W. Wiley, in his book, *Foods and their Adulteration*, says:

This is a very abundant natural fat and is obtained from the kernel of the coconut, especially the two species, *cocos nucifera* L. and *cocos butyracea* L. At ordinary temperature coconut oil is of the consistency of fat. Its taste is pleasant, and it possesses an odor which is not disagreeable or undesirable. It differs from cacao butter in the ease with which it becomes rancid, at which time it takes on a very disagreeable flavor and taste. The coconut oil of commerce is distinguished by different names, according to the country in which it is made.

While we have had no experience in the manufacture of vegetable butter, that being somewhat out of our line, we are at least able to infer from what we have found on the subject that coconut oil is in itself a sort of vegetable butter, and the addition to it of egg

yolks for color and milk or cream for flavor, is but a matter of detail.

3. (b) We do not know; but on general principles it may be stated that manufacturers who work on a small scale are at a disadvantage as to cost, compared with those who do business on a larger scale. In the drug business that disadvantage often is offset by the fact that the retail manufacturer is at no extra expense for rent, help and equipment.

4. Perfumery experts in the trade to whom we have referred this question seem unable to throw any light upon it.

5. From wholesale druggists generally, who either carry it in stock or will get it for customers. It might pay those who use very large quantities of it to buy direct from importers, or to import it themselves. Names of coconut oil brokers will be supplied by letter to those who need their services.

Insect Destroyers.—T. S. C., Illinois, wants a formula for a good louse and other insect destroyer in powder form, and also one for a liquid louse killer.

So far as we know there is nothing quite so practicable and efficacious as an insect destroyer in powder form, as pulverized pyethrum flowers—but the powder should be pure and either fresh or properly preserved. Notes on the use of *cevadilla* and *hellebore* as insect powders appear in the issues of the CIRCULAR for June, page 309, and May, page 253.

As a liquid louse killer tincture of larkspur seed is much used, we believe, as is also tincture of *cevadilla*. A formula follows:

Tincture of Larkspur Seed.

Potassium carbonate.....	1 ounce.
Green soap.....	2 ounces.
Ground larkspur seed.....	8 ounces.
Alcohol	2 pints.
Water	2 pints.
Tincture of lavender.....	to perfume.

Macerate for ten days, decant the clear liquid, place the dregs in a percolator and allow the liquid to drip out.

Other formulas for a preparation of this kind may be found in the issues of the CIRCULAR for April, 1910, page 166; and June, 1909, page 290.

Larkspur seed are poisonous and appropriate care should be used in handling preparations made from them. Their poisonous effect may be produced by application to an abraded surface.

Gourard's Oriental Cream.—O. F. K., Ohio.—In its issue for April, 1907, the *Sanitary Bulletin* of the New Hampshire Board of Health published the results of examinations of a large number of toilet and other preparations. The article is reprinted in the CIRCULAR for September, 1907, page 589. In this report it is stated that Dr. T. Felix Gouraud's oriental cream or magical beautifier "was found to consist of approximately ½ ounce of calomel suspended in a short half-pint of water."

Stockholm Tar.—L. H. H., Missouri.—This is a name, common in Great Britain, for ordinary wood tar which enters commerce via the city of Stockholm. It occurs in the dispensaries and other reference works on pharmacy and materia medica.

Price of Elixir of Lactated Pepsin.—F. P., West Virginia, writes us a letter in which he says:

Will you please give us some information regarding the elixir of lactated pepsin, 40 grains to the ounce, and the method of manufacture so that it would be profitable for us to manufacture our own. We buy it for \$1.50 a gallon, in 5-gallon lots, and any way and any formula we can ever create to contain the constituents costs far above that amount.

When a powdered drug is offered at a lower price than the same drug sells for before it is powdered, the wary buyer will draw his own conclusions. And it is the same way when a mixture or solution of drugs is offered for less than the price of the drugs and the solvent. We do not say that this cap fits the seller of the elixir in question, but—well, as before remarked, each man may draw his own conclusions. One conclusion forces itself upon us as we read our querist's letter, and that is this—either the formula for the elixir which sells at \$1.50 a gallon calls for very small proportions of the various active ingredients which usually go into a preparation of this kind; or, the materials that are used are "short" in quantity or quality.

A similar question of price was discussed in the CIRCULAR for May, 1908, page 232, the preparation about which this question arose being essence of pepsin, N. F., which was sold by a physicians' supply house for \$1.50 a gallon. At that time we calculated that to make a single gallon of the "essence" would probably cost the retail druggist somewhere in the neighborhood of \$2.75. A figuring friend in the trade estimated that a wholesaler might make the essence at a cost to himself of \$1.86.

Just exactly what is meant by "elixir of lactated pepsin" we do not know, as there is no official formula under this name. In the National Formulary is a formula for the essence of pepsin just referred to, which is really a "lactated" product, and one for compound elixir of pepsin, which we think is probably more nearly the formula our querist has in mind. To make a gallon of the latter would probably cost a retail druggist not far from \$3, and by cheapening the elixir as much as possible by using low grade materials and a minimum of alcohol—producing a preparation which it would be illegal to sell under an official name—the cost could hardly be brought down to \$1.50. It seems probable that this \$1.50 elixir of lactated pepsin is made to meet the demands of those who are not over particular about knowing the composition of medicinal preparations so long as their prices are "right."

Solution of Peptonate of Iron with Manganese.—S. P., California, wants to know how the ingredients of this preparation may be manipulated so as to yield a product having no objectionable odor. "So far as I can see," he writes, "the N. F. product is three or four times as strong as the various makes on the market."

This whole question was taken up and discussed in an exhaustive manner by W. H. Harrison in a paper which may be seen in the CIRCULAR for May, 1908, page 210. The length of this paper precludes its reproduction here and to abstract it would be to do the subject an injustice.

At a discussion of this preparation at a meeting of the New York branch of the American Pharmaceutical Association reported in the CIRCULAR for April,

1910, page 198, the J. A. Dunn process for preparing it was described by Cornelius De Yonge. In this process the peptone is added to a solution of basic ferric chloride, and when the mixture begins to thicken the sodium citrate is added; when the mixture has cleared up the soluble manganese citrate is dissolved therein. Tincture of vanilla and spirit of curaçao are used as the flavor.

The improved Dunning formula for making this solution was published in the CIRCULAR for May, 1907, page 361.

Elixir of Calisaya, Iron and Manganese.—T. A. H., North Carolina.—A satisfactory working formula for an elixir of calisaya, iron and manganese depends much upon the form in which the prescriber wishes to give the iron and the manganese and upon the doses he desires. The simplest elixir containing the required medicaments would be a solution of manganese citrate and tincture of iron citro-chloride in elixir of calisaya N. F. As a detailed process for making such an elixir representing an average dose of the several constituents in each dessertspoonful we offer the following:

Quinine citrate.....	2 grammes.
Cinchonine sulphate.....	1 gramme.
Cinchonidine sulphate.....	1 gramme.
Manganese citrate.....	4 grammes.
Tincture of iron citro-chloride.....	24 c.c. (mils).
Glycerin	150 c.c. (mils).
Alcohol	250 c.c. (mils).
Tincture of turmeric.....	2 c.c. (mils).
Purified talc.....	15 grammes.
Oil of orange.....	2 c.c. (mils).
Oil of lemon.....	2 c.c. (mils).
Syrup	200 c.c. (mils).
Distilled water enough to make	1000 c.c. (mils).

Dissolve the two citrates in 300 c.c. (mils) of distilled water with the aid of a gentle heat, and the sulphates in the alcohol. Add the glycerin and the oils to the alcoholic liquid; add the syrup to the aqueous liquid. Shake the alcoholic liquid with the talc; mix the two liquids and set aside for a day or two, shaking occasionally. Filter through paper; add the two tinctures and filter again, adding enough distilled water through the filter to produce the required volume.

Liquid Shampoo Without Alcohol.—C. K.—Perhaps you will find the following formula, taken from a recent number of the CIRCULAR, satisfactory:

Ammonium carbonate.....	1 ounce.
Borax	1 ounce.
Soap, dried, in fine powder.....	1 ounce.
Oil of orris.....	enough.

Directions for use: Place in a vessel of boiling water, and cover tight. When the water has cooled sufficiently, apply as a wash to the hair, then rinse.

Palmer's Vegetable Lotion.—L. T., Ohio.—So far as we know the composition of this preparation has never been divulged to the public. The files of the CIRCULAR contain formulas for toilet preparations of all kinds, and among them you will doubtless be able to find suggestions for preparing a lotion which will make you independent of the large manufacturers of this line of goods.

Cigars, Clerks, Formulas.—Frank E. McKamy, Illinois, is a man who is so full of kindness and information that he is moved by the one to put the other at the disposal of all his brother pharmacists. He writes:

Keeping Cigars in Condition.

Like numerous other druggists who carry a small line of cigars, I have had considerable difficulty in keeping my stock in that line of merchandise anywhere near moist.

I tried the water pans, clay moisteners, and numerous devices without success. Finally I hit upon this plan, which "works like a charm": First of all, I do not attempt to get along without a hygrometer. I place a brick in the lower part of the case, to serve as a base for a small alcohol stove. Then a small pan of water is placed over the lighted stove, and as the water rises in temperature the vapor rises and covers the glass of the case as if it was frosted. When this stage is reached, I extinguish the flame, and leave the cigars to do the rest. They absorb the moisture in about ten minutes, leaving the glass clear again, and not streaked.

By following this method, I am able to keep the cigars at any desired stage of moisture, and at little inconvenience.

Clerks Who "Knock" Pharmacy.

I would like to say a word to the clerks that are "knocking" pharmacy.

It seems to me that a man is a chump, and that he is considerably lacking in nerve, if he raises a hue and cry about the long hours and the insultingly low salary he receives as a drug clerk, and then the first time he is out of a job, hot foots it to the nearest wholesale house to see if anybody there knows of a vacant position in a pharmacy.

If the drug clerk envies plumbers or masons their hours and salary, why doesn't he go after the same for himself? Simply because he considers himself above laying brick, or screwing pipes together; he is a professional man, a pill roller. If he wants to sit down with a high collar on, and be dignified, why doesn't he study for the ministry? But if he chooses to stick to pharmacy, then let him pull off his coat, forget his professionalism, and get down to plain business.

I enclose formulas of several preparations that we are using in our prescription department with satisfaction. They were devised by Dr. E. V. D. Morris, who is not only a registered pharmacist, but a physician and a dentist as well:

Celery, Iron and Kola Compound.

Iron and quinine citrate (soluble).....	40 grains.
Fluidextract of celery seed.....	90 minims.
Fluidextract of kola nut.....	2 drams.
Angelica wine.....	1 pint.
Aromatic elixir.....	enough to make 2 pints.

Improved Cathartic Pill.

Compound extract of colocynth.....	½ grain.
Jalapin	¼ grain.
Podophyllin	⅛ grain.
Leptandrin	¼ grain.
Extract of hyoscyamus.....	⅛ grain.
Extract of gentian.....	¼ grain.
Capsicum	1/12 grain.
Oil of peppermint.....	enough.

Compound Syrup of Sarsaparilla, Clover and Burdock.

Fluidextract of sarsaparilla.....	4 ounces.
Fluidextract of stillingia.....	2 ounces.
Fluidextract of red clover.....	2 ounces.
Fluidextract of senna.....	1½ ounces.
Fluidextract of glycyrrhiza.....	1 ounce.
Fluidextract of burdock.....	1 ounce.
Oil of anise.....	½ dram.
Oil of sassafras.....	½ dram.
Oil of gaultheria.....	½ dram.
Alcohol (80%).....	4 ounces.
Simple syrup.....	enough to make 4 pints.

The foregoing preparations are prescribed quite extensively by the Doctor, alone and in combinations. I hope they may prove of interest to some of the readers.

It is most gratifying to us to see this evidence of a reciprocal feeling on the part of a reader of our Notes and Queries Department. No man "knows it all"—not even an editor—and it is only by gathering, dis-

seminating and preserving information from many sources that a solid foundation for real progress in learning is laid. This is not the first time that we have been thus favored by Mr. McKamy, and we hope it will not be the last; and we trust that many others among our readers will be moved by his example to offer interesting notes and formulas for the benefit of all.

Two British Formulas.—C. S., New Jersey.—The two formulas for which you ask are given below:

Tincture of Quinine, B. P.

Quinine hydrochloride.....	175 grains.
Tincture of orange.....	1 pint.

Ammoniated Tincture of Quinine, B. P.

Quinine sulphate.....	175 grains.
Ammonia water.....	2 fl. ozs.
Alcohol (60%).....	18 fl. ozs.

Mix the ammonia water and alcohol, in this dissolve the quinine sulphate, set aside for three days, and filter.

A British fluid ounce is equivalent to 7 fluid drams, 41 minims, apothecaries' measure; and a British pint (imperial) contains 20 such ounces. When the metric system is used, no explanation of whether British, imperial, apothecaries', fluid or solid weights or measures are meant—a gramme is a gramme and a cubic centimeter is a cubic centimeter, and that is all there is about it.

Tracy's Vegetable Healing Balm.—G. A. G., New York, wants to know something of the composition of this preparation, which, he says, was made in New Hampshire some forty years ago—perhaps at Nashua or Concord. He asks that we or some reader of the CIRCULAR help him. As we are unable to supply the desired information we pass the request along to our readers and hope that one of them may be able to tell our querist what he wants to know.

Hints on Making Bay Rum.—As a postscript to his article on "Real Bay Rum," which appears in the CIRCULAR for April, page 183, Frederick T. Gordon sent the note which is printed below. It reached us too late to be incorporated in the original article, and has been crowded out of subsequent issues until now.

In the formula given for making a bay rum that will approximate closely in odor and qualities the original West Indian bay rum, it should be understood that the question of cheapness has not been considered any more than it is in manufacturing any first-class pharmaceutical product. There are also different tastes, and some would prefer only a small proportion of Santa Cruz rum while others would enjoy the reminiscent odor of the fast-disappearing *real* article.

The point I desire to emphasize is the use of a good quality of rum in lieu of alcohol and water in making bay rum, the proportionate amount to be decided by the tastes of the maker's customers. Of course, the proportion of alcohol used may be varied to correspond with the price to be charged for the product, that is, the cheaper the bay rum the less alcohol would be used. However, it must be borne in mind that when the proportion of alcohol is diminished there is less of the oil of bay in solution in the finished product, so that if you decide to use a weak alcoholic menstruum there is no use of wasting expensive oil of bay by putting into the mixture more than the solvent will dissolve. And here I believe is the cause of inferiority in much of the stuff called "bay rum"; to cheapen the article the makers do not use enough alcohol to dissolve a proper proportion of the essential oils, so while they may use a liberal amount of oils most of them are left in the

clearing medium or on the filter-paper. This is one reason the bay rum often becomes "cloudy" after keeping—there was not enough alcohol used at the start, but perhaps the high temperature of the work-room caused more oil to dissolve than could be held in solution at a lower temperature, hence in the cooler store the oil separated and made the bottled product appear turbid. This fact is considered in the making of bay rum by distillation—the freshly distilled product is collected in large containers and allowed to stand for some time, any excess of oil rising to the surface; then the bay rum for bottling is drawn through faucets from the bottom of the tanks, usually needing filtration. I have been told that sometimes enough oil of bay collects at the top to pay for collection.

The thing to bear in mind is that bay rum is a luxury of the toilet, and if it isn't good it isn't worth using. It is the pungent aromatic odor and the cooling effect of the evaporating alcoholic fluid that makes it so refreshing and grateful to the skin; you might just as well use oil of citronella if you only want something that smells like a barber shop. Make your bay rum of full alcoholic strength and it will be appreciated.

A Good Ink Formula.—Charles Steck, New Jersey, writes:

I have made ink according to a formula published with several others, a year or more ago and find it very satisfactory; the only trouble is to get indigotin—the jobber sent sulphate of indigo instead. Without this initial blue the ink has a gray-green appearance at first, then turns black after a few hours.

The formula referred to is doubtless the one given by Prof. Scoville in an exceptionally interesting paper on the making of ink, appearing in the CIRCULAR for January, 1909, page 13. It is here reproduced:

Tannic acid.....	3 ozs. av.
Gallic acid.....	1 oz. av.
Ferrous sulphate.....	2 ozs. av.
Solution of ferric chloride, U. S. P.	1 fl. oz.
Indigotin	1½ ozs. av.
Acacia	60 grains.
Phenol	60 grains.
Water	1 gallon.

Dissolve the tannic and gallic acids and indigotin in 6 pints of warm water. Dissolve the iron salts, acacia and phenol in the remaining (quart of) water and mix with the first solution. Shake frequently during several days. Allow the ink to stand at least two weeks before filtering.

A correspondent (see the CIRCULAR for April, 1910, page 177) said some very uncomplimentary things about this formula, to which its author replied that he made ink according to his printed formula; that it was a good article; that he had made tests by exposing writing done with this ink to sun and water, and that the ink stood them well. "All that I can say," he added, "is that it suits me, and I am sorry to have bothered the other fellows who are of a different mind." As to the solubility of indigotin, Prof. Scoville said that he found a soluble kind on the market which he used in making his ink.

Licorice Paste.—"Subscriber," Massachusetts.—We believe the licorice paste used by manufacturers of tobacco is nothing more than crude extract of licorice described in the United States Dispensatory and other pharmaceutical text-books. Your attention is also called to the solution of extract of licorice of the National Formulary.

Ant Exterminator.—H. H. S., Illinois, and J. H. K., North Carolina.—In the CIRCULAR for September, 1910, page 470, is an exhaustive note on destroying

ants in which are incorporated many formulas. This note is too long to be reproduced in full so soon, and to reproduce only a portion of it would be to do the subject an injustice.

Anonymous Queries.—R. S. B., New York; and L. Y. L., Maine.—Your attention is called to the standing notice at the head of this department in which it is stated that queries, to be answered by us, must be accompanied with the name and address of the writer. Not only do we keep that notice standing, but almost every month we print a note similar to this one, calling special attention to it; and now and then we give our reasons for having made such a rule.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Fidol.—R. C., New York. Where may it be obtained?

Tracy's Vegetable Healing Balm.—G. A. G., New York.

Tornado—for bed bugs. Where may it be obtained?

Asfalath—a perfume.—D. W., Mississippi.—What is it, chemically?

Palmer's Vegetable Lotion.—L. T., Ohio.

Pill Mass.

To overcome the difficulty of incorporating liquids, ethereal oils, balsams, creosote and similar substances into pills, Danzel (*Bull. comm.*) recommends an excipient prepared according to the following formula:

Extract of licorice.....	4.0
Powdered tragacanth.....	2.0
Powdered soap.....	2.0
Wheat starch.....	1.2
Powdered sugar.....	0.6
Magnesium hydroxide.....	0.6

Solid substances should first be mixed with mucilage of acacia, honey, etc., before being incorporated into this excipient.

Gray Oil.

Adams, writing in the *Journal of the Royal Army Medical Corps*, suggests the following formula for a mercurial injection, to be prepared according to art:

Mercury	20 grammes.
Anhydrous wool-fat.....	30 grammes.
Butyl-chloral hydrate.....	3 grammes.
Liquid petrolatum.....	to make 100 c.c. (mils).

Photographic Retouching Medium.

Oil of turpentine.....	6 ounces.
Oil of spike lavender.....	2 ounces.
Pale rosin.....	4 ounces.
Linseed oil.....	32 minims.
Terebene	80 minims.
Amyl acetate.....	1 ounce.

To Remove Corns and Warts.

Saturate one ounce of alcohol with salicylic acid, and add 50 drops of castor oil. Apply by dampening night and morning.—Dr. James L. Linder in the *Medical World*.

College Graduates Before the Board.

"What kind of pharmaceutical education can it be that our young men and women receive during their two or three years at college, if, when they are fresh from the class rooms and quizzes only one in every three or four or half a dozen or more is able to pass a board examination? Or, what kind of a board examination are they expected to pass?"

These questions, along with some others and a few figures and comments, in which the boards of New York and Pennsylvania are mentioned, appear in the CIRCULAR for May, page 238. In the issue for June, page 314, is published a letter from Louis Emanuel, president of the Pennsylvania Board of Pharmacy, on the subject. He states that of 56 applicants for registration as pharmacists examined in Pennsylvania in February, only 13, or less than 1 in 4, were successful. All the applicants had had four years of experience in compounding and dispensing medicines on physicians' prescriptions, and each one was a graduate of a "reputable college of pharmacy." Of the failures, the Philadelphia College of Pharmacy had 20 per cent.; the Pittsburg College of Pharmacy also had a 20 per cent. failure; and the department of pharmacy of the Medico-Chirurgical College of Philadelphia had a 40 per cent. failure.

Following up his previous letter, Mr. Emanuel sends us a further communication in which he shows himself to be quite in earnest in his endeavor to locate the blame for the inconsistency which we have pointed out, as he encloses with it a set of the questions used at the February examination of his board, and three sets of answers, given by three candidates, respectively, who were graduates, respectively, of the three colleges of pharmacy.

Mr. Emanuel writes:

College Curricula and Board Examinations.

I am a radical of RadicalsVille, and a muckraker from Muckrakersburg, and yet I feel like a fool rushing in where angels fear to tread.

The practice of pharmacy to-day may be compared to the "sick man of Europe," the various interests jealously regarding one another with distrust lest one or the other will reap a greater division of the spoils of dismemberment.

Here we have the pharmaceutical manufacturing interests, the dispensing doctor, the manufacturer of physicians' supplies, the general store interests, and lastly, but not least, the cut-rate interests, ravenously struggling for the largest share of that art, which the slaves of pharmaceutical toil keep in existence by the transfusion of new blood from year to year.

For nearly sixty years legislation has endeavored to confine the practice of pharmacy to those who are most fitted for it, but constitutional prerogatives have baffled the most skilled legislative experts, so that to-day only that part of the art of pharmacy is protected which applies to the compounding of prescriptions and the dispensing of drugs, which must be done by those who are deemed to be qualified and for which an examination is required.

Some schools of pharmacy do not take kindly to the examination of their graduates as to their qualifications, their argument being that after a person has had several years' experience in a drug store and is graduated, he should not be obliged to undergo an additional test; and some hold that a term in their pharmaceutical laboratory—where no postage stamps or soda water, etc., etc., are sold—is better than the four years' experience obtained in most drug stores.

The pharmacy board has examined many graduates of some of these schools, and I am prepared to prove that to register all graduates without a final test by a disinterested authority would convert some schools into depart-

ments for revenue primarily, and educational purposes secondarily.

The object of the present-day school-of-pharmacy curriculum seems to be to teach fundamental principles, and it is up to the graduate to apply these principles as the occasions present themselves. The methods of teaching pharmacy and its collateral branches appear to differ, and as I am not competent to enter into this feature of the matter under consideration, I will not give it attention. However, I feel that there is room for a systematic method, or rather a universal method or standard that should be adopted by schools of pharmacy for ascertaining the amount and character of knowledge which a student has absorbed before he is graduated. And I am inclined to observe that the teachers may forget when they note the failures to pass a board examination that all their students have not uniform capacities or capabilities, and as this is true, they should not expect to obtain a uniform result.

A pharmacy board's examination should be so constructed as to ascertain the amount of knowledge of the practice of pharmacy which a candidate may have who desires to hold himself out to the public as competent to conduct properly a first-class drug store. Of course our present board thinks its methods are proper, that they leave little to be improved upon, and that through these methods they are able to separate the efficient from the inefficient. The efficient are certainly entitled to the reward of success, and those not so efficient, either naturally or through indolence or indifference, must be expected to remain in the inefficient class, no matter whether they have been graduated or not.

I am not in favor of the board shaping its examinations in harmony with a college curriculum, because this would be in the nature of a "gentleman's agreement," which might in time lead to unsavory results. The college curriculum amounts to nothing if the graduation requirements are neglected. But with a broad curriculum, a high exit or graduation requirement, the board's examinations will appear insignificant.

I am inclined to contend that a college curriculum ought to embrace not only fundamental principles, but also matters of up-to-date concern. Indeed it may include advance matters or knowledge of pharmacological research, and thus keep in advance rather than in the rear of that element which is fast reducing the practice of pharmacy to a condition of barter and trade. Professionally a graduate should know how to distinguish between Hungarian and German chamomile, that the receptacle of the flower heads of *matricaria chamomila* are naked, conical and hollow; that the receptacles of *anthemis arvensis* and *maruta cotula* are chaffy, conical and solid. But this knowledge is of little practical value. Gray oil is a 10 per cent. mixture of mercury in a bland oil, and exported by a foreign manufacturer for hypodermic use; a knowledge of the manufacture of a 10 per cent. mixture of mercury in a bland oil would be of practical value and tend to cherish the art of pharmacy. In the same line are *mercurettes*, these being small tablets an inch long, a half an inch wide, and an eighth of an inch thick, weighing 100 grammes 30 grammes of which is mercury and 70 grammes cacao butter. I am inclined to hold that students should be taught how these may be made, in order that they may be able to cherish the art of pharmacy, and prove to the medical profession that they are competent and deserving of confidence.

But the question of the hour is, What is the most efficient method for ascertaining the amount of knowledge a student has absorbed? To this I will answer, Let the American Conference of Pharmaceutical Faculties appoint a committee on graduation, this committee to construct methods and rating values to answer for use by all its members, the examination and rating as constructed by this committee to be revised annually. And then if over 25 per cent. of those who are graduated under such a method, do not know how to properly compound the following prescriptions, then I will say that the method is not worth—well, is not a good one, and it should be improved.

[The prescriptions referred to are those used in the "practical examination," given on pages 368 and 369.]

Art requires much time and close application for its accomplishment. An artist will spend many months in painting a picture, beautiful and perfect to him; but an expert will at a glance discover the imperfection. And similarly

a graduate in pharmacy may spend years in gaining experience, and months at a college, perfecting the picture of a competent pharmacist, when along comes the pharmacy board and in almost a glance discovers that the fundamental principles have not been absorbed by the student, or if absorbed have not been put to practical use when required.

When the physician prescribes ten 3-grain Blaud's pills, he assumes that the pharmacist has learned how to prepare them properly. When concentrated hydrochloric acid is prescribed in a fluid mixture with potassium chlorate, then it is the pharmacist's opportunity to show that he has learned the fundamental principles of chemistry and of pharmacy. I fail to see the validity of such excuses as self-hypnotism, fright, nervousness, etc.: these affections come mostly to the incompetent who know their own shortcomings, or to those who lack self-confidence. Self-confidence is attainable, and it is up to the schools to render their graduates confident in the knowledge they have.

LOUIS EMANUEL.

Next below are given copies of the papers presented to the candidates for examination, including preliminary instructions, questions requiring written answers, and prescriptions; etc., to test the ability of the candidate in other directions, with the candidates' answers and ratings:

Take Notice.

"Close observation in all things and a thoroughness of your work is the price of success."

TO THE APPLICANT FOR EXAMINATION:

Please read the following rules for this examination, and be governed thereby during the time you are engaged with your work.

(1) In order to be eligible as an applicant for examination and registration as a pharmacist, you must have had not less than four years' practical experience in the business of retailing, compounding, or dispensing of drugs, chemicals and poisons, and of compounding of physician's prescriptions, and be a graduate of a reputable college of pharmacy; and be not less than twenty-one (21) years old.

(2) Your EXAMINATION NUMBER will be found printed at the top of the accompanying question sheet. On the answer sheets herewith attached will be found a line on which each applicant is required to enter the examination number. *Said numbering must not be neglected.* Write your number on each of the sheets now and you will be sure not to forget to do it.

(3) The questions are lettered from A to Z. The answer sheets are lettered from A to Z. The answer to question A can only be written on the corresponding answer sheet A. You may write on BOTH SIDES if necessary. Question B answers on answer sheet B and this system MUST be followed in answering all the questions. *Using these answer sheets in any other manner will make your examination unsatisfactory.*

(4) When you have completed your work arrange your answer sheets in ALPHABETICAL order from A to Z and, together with the question sheet, place them in the hands of the person having charge of your room.

(5) Copying from books or notes, or from the written work of any other candidate in the room, or giving or receiving information in any manner whatsoever during the examination will make BOTH persons liable to rejection, without further notice by the examiners.

(6) Candidates are not permitted to leave the examination room except in case of necessity, when permission must be obtained, and in that event their absence must be as brief as possible; during absence from the room the question sheet and answer papers must be left on the desk. Smoking during the examination is not permitted.

BY ORDER OF THE BOARD.

The principal question sheet was headed as follows:

THE QUESTION SHEET OF

THE STATE PHARMACEUTICAL EXAMINING BOARD OF PENNSYLVANIA

FOR REGISTERED PHARMACIST CERTIFICATE.

Candidate's Name.....
Address
Your Examination Number is.....(Put this number on every sheet of paper you write).

The Eighty-Eighth Examination.

Write your name and address at the top of this paper. Write the answers to each subject on a separate piece of paper, and put your examination number on each. Number or letter each answer to correspond with the number or letter preceding each separate question. Books or written memoranda are not allowed; nor is any intercourse whatever between the candidates permitted. Arrange your answer papers in alphabetical order from A to Z.

This question sheet must be handed in along with your answer papers.

There were twenty-five questions (one for each letter in the alphabet except J), and each question was divided into several parts, designated by figures. To each subdivision the examiners attached a certain weight (not revealed to the candidate) for use in grading the answers. The total weight of the entire twenty-five questions was 250, so that a candidate who answered all correctly would be graded 250, equal to 100 per cent. For each question missed by a candidate, a deduction of the weight of that question was made, with a corresponding falling off in his percentage. The questions (printed in italics) follow, their weights being indicated. The answers of each of three candidates, with the rating, expressed as "weight," given to such answers by the examiners, also follow. For purposes of identification, the three candidates are spoken of as "Smith," "Jones" and "Brown." "Smith" received the degree of doctor of pharmacy from the Philadelphia College of Pharmacy in 1906. Whether he waited five years after his graduation before applying for board license, or whether he has applied before and failed, as seems more probable, is not stated. "Jones" received his diploma as a graduate of the Pittsburg College of Pharmacy in 1907. "Brown" is a graduate of the department of pharmacy of the Medico-Chirurgical College, class of '10.

Question A.

1. Define specific gravity. (Weight 1.)

Smith did not attempt any of question A.

Jones: Specific Gravity is the comparative weight of substances as compared with the standard. Water is taken as the standard. (Weight 1.)

Brown: Specific gravity is the process of taking weight of any liquid.

2. If one liter of sulphuric acid weighs 1820 grammes what will its specific gravity be? (Weight 1.)

Jones: $1820 \div 1000 = 1.82$. Sp. Gr. of Sulphuric Acid. (Weight 1.)

Brown did not attempt any more of question A.

3. How many liters are contained in 4550 grammes of sulphuric acid? (Weight 1.)

Jones: $4550 \div 1.82 = 2500$ CC. of Sulphuric Acid. (Weight 1.)

4. If a cubic centimeter of a liquid weighs .716 grammes what will its specific gravity be? (Weight 1.)

Jones: $.716 \div 1 = .716$ Sp. Gr. of Liquid. (Weight 1.)

5. What will ten grammes of this liquid measure? (Weight 1.)

Jones: $10 \div .716 = 14$ CC. Liquid measures.

6. Demonstrate the number of minims contained in a cubic centimeter. (Weight 1.)

Jones: $60 \text{ M} = 1 \text{ dr.}; 1 \text{ dr.} = 3.7 \text{ CC.}; 60 \div 3.7 = 16.23$ Min in 1 CC. (Weight 1.)

7. Demonstrate the weight of one minim of water. (Weight 1.)

Jones: $455.7 \text{ Gr.} = \text{Weight of 1 ounce of Water. } 455.7 \div 480 = .95 \text{ gr.}$

8. State why a bushel of wheat weighs 60 pounds, and a bushel of oats only 30 pounds. (Weight 1.)

Jones did not attempt this.

9. How many bushels are contained in 150 pounds of wheat? (Weight 1.)

Jones: $2\frac{1}{2}$ Bushels. (Weight 1.)

10. Is there a difference in the weight of a pound of cotton and a pound of lead? (Weight 1.)

Jones: There is no difference in the weight. (Weight 1.)

Brown: Take my Strychnine Sulphate rub it together in mortar with the Quinine Sulphate add my Reduced Iron and Lastly my Extract of Belladonnae. The excess dose of the Strychnine Sulphate, The Extract Belladonna, The Acid Arseniosi.

Total weight of question D, 15; Smith made 12; Jones, 8; Brown, 7.

Question E.

1. What official drug is the result of a sting of an insect? (Weight 1.)

Smith: Powdered Nut Gall. (Weight 1.)

Jones: Nutgalls. Gallae. (Weight 1.)

Brown did not attempt any of Question E.

2. Name an official drug consisting of the whole insect. (Weight 1.)

Smith: Powdered cantharidies. (Weight 1.)

Jones: Cantharis vesicatoria. (Weight 1.)

3. What two official drugs consist of substances secreted by the digestive organs of Mammalia? (Weight 1.)

Smith: Pepsin. (Weight ½.)

Jones: (a) Pepsinum. (b) Pancreatinum. (Weight 1.)

4. What official saccharine substance is obtained from a member of the class Mammalia? (Weight 1.)

Smith: Sugar Milk. (Weight 1.)

Jones: Saccharum Lactis. (Weight 1.)

5. What saccharine substance is secreted by a member of the class Insecta? (Weight 1.)

Smith: Honey. (Weight 1.)

Jones: Mel. (Weight 1.)

Total weight of question E, 5; Smith made 4½; Jones, 5; Brown, 0.

Question F.

Give the official Latin title and botanical source of each of the following: (1) Dandelion. (2) Burdock. (3) Lobelia. (4) Bloodroot. (5) Witchazel Bark. (6) Boneset. (7) Saw Palmetto. (8) Indian Hemp. (9) Sweet Flag. (10) Marigold. (Weight of each subdivision, 1.)

Smith: (1) Dandelion—Taraxicum—United States. (2) Burdock Root. (3) Lobelia. (4) Bloodroot. (5) Witchazel Bark—Hamamelis—United States. (6) Boneset—Eupatorium (7) Saw Palmetto. (8) Indian Hemp. Cannabis Indica. Canada. (9) Sweet Flag. Calamus. (10) Marigold. (Weight 3.)

Jones: (1) Taraxacum—Taraxacum officinale. (2) Frangula—Rhamnus frangula. (3) Lobelia—Lobelia inflata. (4) Sanguinaria—Sanguinaria canadensis. (5) Hamamelis Cortex—Hamamelis Virginiana. (6) (7) Sabal—Seruna serulata. (8) Cannabis Indica—Cannabis sativa. (9) Calamus—Acorus Calamus. (10) (Weight 7.)

Brown did not attempt this.

Total weight of question F, 10; Smith made 3 (½ each on 1, 3, 5, 6, 8, and 9); Jones, 7; Brown, 0.

Question G.

Give the usual adult dose of the following: (1) Arsenic Trioxide. (2) Apomorphine Hydrochloride. (3) Silver Nitrate. (4) Atropine Sulphate. (5) Elaterin. (6) Elaterium. (7) Diluted Hydrocyanic Acid. (8) Morphine Sulphate. (9) Hyoscine Hydrobromide. (10) Strychnine Nitrate. (Weight of each subdivision ½.)

Smith: (1) grs. 1/16. (2) grs. ½. (3) grs. ¼. (4) grs. 1/150 to grs. 1/250. (5) grs. ½—grs. i. (6) grs. ⅛—grs. ¼. (7) M ½—M ½. (8) grs. ½—grs. i. (9) grs. 1/50—grs. 1/150. (10) grs. 1/60—grs. 1/32.

Jones: (1) 1/30 gr. (2) 1/10 gr. (3) ¼ gr. (4) 1/160 gr. (5) 1/10 gr. (6) (7) 1½ min. (8) ¼ gr. (9) 1/128 gr. (10) 1/64 gr.

Brown: (1) ¼ gr. (2) ½ to .1 gr. (3) ½ to 1 gr. (4) 1—2 gr. (5) (6) (7) 5—10 M. (8) 1/30. (9) ¼ gr. (10) ¼—½ gr.

Total weight of question G, 15 (1½ for each of the ten subdivisions); Smith made 8 (perfect score on 3, 4, 7, 9 and 10, and ½ on 6); Jones, 13 (perfect score on all but 2 and 6; 2 he made 1, and on 6 he made 0); Brown, 1 (½ on 3 and ½ on 8).

Question H.

Give the definition of the following terms applied to the action of certain drugs, and mention one drug belonging to each class: (1) Analgesic. (2) Antispasmodic. (3) Mydriatic. (4) Myotic. (5) Sternutatory. (6) Diaphoretic. (7) Galactagogue. (8) Pustulant. (Weight of each subdivision, 1.)

Smith: (1) Analgesic. One that reduces pain. (2) An-

tispasmodic. One that just opposite. One that stops spasmodic attacks. (3) Mydriatic. One that enlarges the pupil of the eyes. (4) Myotic. One that decreases or makes the pupil smaller. (5) Sternutatory. (6) Diaphoretic. One that reduces. (7) Galactagogue. One that produces the milk or makes Milk. (8) Pustulant.

Jones: (1) (2) An anti-spasmodic is a drug that allays spasms. Ex. Valerian Asafoetida. (3) Mydriatic is a drug that dilates the pupil of the eye. Ex. Belladonna. (4) Myotic is a drug that contracts the pupil of the eye. Jaborandi. (5) Sternutatory is a drug that causes sneezing. Soap Bark. (6) Diaphoretic is a drug that produces perspiration. Ipecac. (7) Galactagogue is a drug producing the secretion of milk.

Brown: (1) To sooth—camphor. (2) To quite a person—strychnine sulphate. (3) To enlarge pupil of eye—atropine Sulphate. (4) To decrease dilation of eye—apomorphine Hydrochloride. (5) To produce sneezing—soap bark.

Total weight of question H, 10; Smith made 3½ (1 each on 3 and 4, and ½ each on 1, 2 and 7; Jones, 5 (1 each on 2, 3, 5, and 6, and ½ each on 4 and 7); Brown, 2½ (1 each on 3 and 5, and ½ on 4).

Question I.

ACID HYDROCYANICUM DILUTUM.

Silver Cyanide..... 6.00 Gm.

Diluted Hydrochloric Acid..... 15.54 Cc.

Distilled Water..... 44.10 Cc.

(1) Construct an equation showing the production of hydrocyanic acid in the above formula. (Weight 4.)

Smith did not attempt any of question I.

Jones: $\text{HCl} + \text{Ag. Cn} = \text{Ag Cl} + \text{HCn.}$ (Weight 4.)

Brown. $\text{Ag Cn}_2 + \text{HCl} + \text{H}_2\text{O} = \text{AgNO}_2 + \text{HCN} + \text{Cl}$ (Weight 3.)

2. Show by chemical calculation the weight in grammes of absolute hydrocyanic acid that would be produced from this formula. (Atomic weights: Ag = 107.12, C = 11.91, N = 13.93, Cl = 35.18, H = 1.) (Weight 4.)

Jones did not attempt 2, 3, 4 or 5.

Brown did not attempt 2, 3, or 4.

3. Diluted hydrochloric acid contains ten per cent., by weight, of absolute acid, and has the specific gravity, 1.049: Show why exactly 15.54 Cc. of diluted hydrochloric acid is required. (Weight 4.)

4. Assuming that the diluted acid produced by the above formula weighs 60 Gm., demonstrate the per cent., by weight, of absolute hydrocyanic acid that it would contain. (Weight 2.)

5. How does the U. S. P. direct this acid to be kept? (Weight 1.)

Brown: Dark glass stoppered bottles away from light and heat. (Weight 1.)

6. What change takes place when this acid is improperly kept or when it is too old? (Weight 1.)

Jones: It should be kept in amber colored bottles with glass stoppers. It should be kept in a dark place. (Weight 1.)

Brown: Loses its strength & Color. (Weight 1.)

Total weight of question I, 16; Smith made 0; Jones, 5; Brown, 5.

Question K.

1. Give the botanical name of the plant yielding Jalap. (Weight ½.)

Smith: The Root Jalape Tuberosa.

Jones: Exogenium purga. (Weight ½.)

Brown did not attempt this.

2. What is the character of the drug, state also the character of the plant itself. (Weight ½.)

Smith: It is a tuberous root. (Weight ½.)

Jones did not attempt this.

Brown: It has the shape of an egg, has ridges in it and very dark in appearances. (Weight ½.)

3. In what family is the plant included? (Weight ½.)

Smith: In the family Convolvulaceae. (Weight ½.)

Jones: Convolvulaceae. (Weight ½.)

Brown: Solanaceae.

4. Name the official preparations of Jalap. (Weight ½.)

Smith: Pulvis-Jalapae Comp. (Weight ½.)

Jones: Compound Powder of Jalap. Resin of Jalap. (Weight ½.)

Brown: Tincture. (Weight ½.)

5. What menstruum is necessary to extract the medical properties of this drug? (Weight ½.)

Smith: Dilute Acetic Acid.

Jones: Alcohol. (Weight ½.)

Brown: Alcohol. (Weight $\frac{1}{2}$.)

6. Give medicinal properties and dose of powdered Jalap. (Weight $\frac{1}{2}$.)

Smith: It has action on the bowels. And a strong purgative. Dose grs. $\frac{1}{2}$ to grs. ii.

Jones: Diuretic, Hydrogogue Cathartic $7\frac{1}{2}$ grs. (Weight $\frac{1}{2}$.)

Brown: (6) Purgative. (7) $\frac{1}{2}$ gr.

Total weight of question K, 3; Smith made $1\frac{1}{2}$; Jones, $2\frac{1}{2}$; Brown, $1\frac{1}{2}$.

Question L.

Tinct opii M LXXX
... catechu 3vi
Bismuthi Subnit 3ij
Mist Cretae ad 3ii
M. Sig. Shake well take half table
spoonful in water, 1. R. S.

1. Give the English name and quantity that would be contained in each dose. (Weight 4.)

Smith: Laudanum, $13\frac{1}{4}$ minims; Tr. Catechu 3i; Bismuth Subnitrate grs. XV; Mist Cretae 3ii minims XL (Chalk Mixture).

Jones: Tincture of Opium 10 drops. (b) Tincture Catechu 45 min. (c) Bismuth Subnitrate $11\frac{1}{4}$ gr. (d) Chalk Mixture 1 dr. (Weight 2.)

Brown: Tincture opium M LXXX = 10 M; Tincture Catechu f3 vi = 12 M; Bismuth Subnitrate 3iss = gr $8\frac{3}{4}$; Mist Cretae ad 3ii = M. Sig. Shake well take half tablespoonful in water. (Weight 2.)

2. What official products would you use in compounding it? (Weight 2.)

Smith: Laudanum—Tincture Catechu—Bismuth Subnitrate—Chalk Mixture. (Weight 2.)

Jones: Tincture Opium. Tr. Gambir. Bismuth Subnitrate. Chalk Mixture. (Weight 2.)

Brown: The 1st ingredient I would dispense Laudanum for it & The rest as per prescription.

3. How much would it measure? (Weight 2.)

Smith: It would measure 3 ozs.

Jones: 33.

Brown passed it by.

4. How much granulated opium would be represented in each dose of this prescription? (Weight 3.)

Smith: Half to $\frac{1}{4}$ gr. Granulated Opium would be contained in each dose of this prescription.

Jones: $1/25$ gr.

Brown gave it up.

5. Why does the prescriber direct the use of a "shake well" label? (Weight 2.)

Smith: Because the Bismuth Subnitrate would leave a precipitate. And is very insoluble. And the Chalk Mixture makes a incompatible mixture also. And the Tincture Catechu has a tendency to be incompatible. (Weight 1.)

Jones: The shake well label is used because the Bismuth Subnitrate and Acacia are insoluble. (Weight 2.)

Brown: On account of the Mistura Cretae & Bismuth Subnitrate.

6. Name three official salts of bismuth insoluble in water. (Weight 1.)

Smith: Bismuth Iodide—Bismuth Salicylate—Bismuth Subcarbonate. (Weight 1.)

Jones: Bismuth Subcarbonate (b) Bismuth Subgallate (c) Bismuth Subnitrate. (Weight 1.)

Brown: Bismuth Subnitrate; Bismuth Subgallate; Bismuth Salicylate. (Weight 1.)

7. Of what is the last ingredient in the prescription composed? (Weight 1.)

Smith: Prepared Chalk, Sugar, Pulvis Acacia, Water Distill and Cinnamon Water. (Weight 1.)

Jones: Acacia, Sugar, Chalk, Water, Cinnamon water. (Weight 1.)

Brown: Chalk Powder; Sugar Milk; Acacia.

7a. Why is acacia used in it? (Weight 1.)

Smith: Acacia is used in it to keep the mixture more uniform and stable, and to hold the substances in suspension and more palatable. (Weight 1.)

Jones: Acacia is used to suspend the chalk in chalk mixture. (Weight 1.)

Brown: To hold Sugar Milk & Chalk together.

8. What is "Native Calcium Carbonate, freed from most impurities by elutriation"? (Weight 1.)

Smith and Brown seemed to have overlooked this one.

Jones: Purified Talc.

Total weight of question L, 17; Smith made 6; Jones, 9; Brown, 3.

Question M.

1. Give directions for preparing this prescription, mentioning all details which should be regarded in making it suitable for use in the eye. (Weight 5.) [For the prescription, see below.]

Smith: First all graduates and glass rods for making this Eye Prescription should be boiled or Sterilized—Dissolve the Zinc Sulphate in sufficient water also the Boracic Acid. Add the Sodii Chloride to the Boracic Acid Solution. Run the two solutions through cotton to get all foreign principles out. Then add camphor water to mucilage Sassafras. Mix two solutions. And then distilled water to make the prescription measure oz. two. (Weight 5.)

Jones: The boric acid should first be dissolved by a small quantity of warm water, to this should be added the Zinc Sulphate and Sodium Chloride, dissolved in water. The Mucilage of Sassafras and Camphor Water are then added successively with enough distilled water to make two ounces. Any foreign or insoluble substances should

7. Zinc Sulphate 3ii
Acidi Boracis aa 3ss
Sodii Chlorid
Mucilagis Sassafras 4ss 3ii
Aque Camphorat 3i
Aqua Distilat qd 3ii
M. Sig. - Eye solution
7/19/11
Dunnellan

be removed by filtration, and only perfectly clear solution dispensed. (Weight 5.)

Brown: Take your Zinc Sulphate rub it up in the mortar to a fine powder—Take some water & dissolve your Zinc Sulphate place this into your bottle—Take your Boracic Acid & Sodium Chloride rub together with Aque Camphor & your mucilage place into the bottle ad your water & strain before handing to customer. (Weight 4.)

2. How much would it measure? (Weight 1.)

Smith: It will measure two ounces. (Weight 1.)

Jones: 2 3. (Weight 1.)

Brown: 3 ounces.

3. What does "aa" mean and to what does it apply? (Weight 1.)

Smith: AA means each. To Boracic Acid. (Weight 1.)

Jones: Aa means of each. It applies to Sodium Chloride and Boric Acid. (Weight 1.)

Brown: aa means of each and it applies to the Sodium Chloride, & Boracic Acid. (Weight 1.)

4. Write such a label as is desired by the prescriber. (Weight 1.)

Smith:

Zinc Sulphate grs ii
 Acid Boracic
 Sodii Chloride aa grs. x
 Mucilage Sassafras Med 3 ii
 Aquae Camphorae f 3 ii
 Aquae Destil qs ad f 3 ii

M et Sig Eye Lotion. Use freely in eyes as directed by Dr. Donnelly. (Weight 1.)

Jones: Eye Solution.

Put the patient's name on the Label—also the word "eye Lotion" & formula. (Weight ½.)

Brown: Put the patient's name on the label—also the word "eye lotion" & formula. (Weight ½.)

5. What effect does dissolving chemical salts in camphor water have upon the latter? (Weight 2.)

Smith: It throws the camphor out in Solution. (Weight 2.)

Jones: Chemicals dissolved in Camphor water renders the camphor less soluble. (Weight 1.)

Brown: The alcohol taking up the Salts.

Total weight of question M, 10; Smith made 10; Jones, 8; Brown, 5½.

Question N.

1. What is Calx? (Weight 2.)

Smith: Calx—Mean Lime. (Weight 2.)

Jones: Calcium Oxide or Lime. (Weight 2.)

Brown: Calcium Chloride.

2. How does the U. S. P. direct that it should be prepared? (Weight 1.)

Smith skipped this.

Jones: It should be prepared by calcining marble or the purest varieties of native Calcium Carbonate. (Weight 1.)

Brown: Chlorine on calcium chloride.

3. How should it be kept, and state why? (Weight 2.)

Smith: It should be kept in Air tight containers. (Weight 2.)

Jones: It should be kept in tightly stoppered bottles. It absorbs CO₂ which converts into Calcium Carbonate. (Weight 2.)

Brown: Glass stoppered bottle on account of its strength.

4. What official preparations are made from it? (Weight 1.)

Smith: Lime Water. (Weight ½.)

Jones: Chloride of Lime—Lime Water. (Weight ½.)

Brown did not try this.

5. Chemically, what is marble? (Weight 1.)

Smith: Marble is a Calcium Carbonate. (Weight 1.)

Jones: Calcium Carbonate. (Weight 1.)

Brown: Calcium Chloride. (Weight 1.)

6. What are oyster shells, chemically? (Weight 1.)

Smith: Oyster shells are a carbonate of lime. (Weight 1.)

Jones: Calcium Carbonate. (Weight 1.)

Brown: Calcium Chloride. (Weight 1.)

7. What effect has prolonged heat on oyster shells? (Weight 2.)

Smith: Makes them crumble.

Jones skipped this.

Brown: Crack & Crumble.

Total weight of question N, 10; Smith made 6½; Jones, 7½; Brown, 2.

Question O.

Translate the following: (1) Bis in d. (2) Coch. infant. (3) Coch. parv. (4) Coch. ampl. (5) Coch. mag. (6) Pone. (7) et. (8) cum. (9) P. r. n. (10) Scat. (Weight of each subdivision 1.)

Smith: Bis-in. d.— By day—two times daily. (Weight 1.) (He did not attempt any of the others.)

Jones: (1) Twice a day. (2) (3) A teaspoonful.

(4) A desertspoonful. (5) A tablespoonful. (6) Behind.

(7) And. (8) With. (9) According to circumstances.

(10) A box.

Brown: (1) Twice a day. (7) And. (9) before meals. (Others not attempted.)

Total weight of question O, 10 (1 for each subdivision); Smith made 1; Jones, 9; Brown, 3.

Question P.

1. What is sterilization? (Weight 1½.)

Smith: Sterilization. Means to boil free from all foreign principles, and all germs. (Weight 1½.)

Jones: Sterilization is heating to a high temperature to kill the microbes and germs contained in a substance. (Weight 1.)

Brown: Sterilization is the process of killing germs with aid of water. (Weight 1.)

2. What is pasteurization? (Weight 1½.)

Smith: Pasteurization. Means to boil and get rid of all germs that may attack a human body. (Weight 1.)

Jones: Pasteurization is a process of killing the microbes and germs contained in milk. (Weight 1½.)

Brown: Pasteurization is the process of killing germs with aid of steam. (Weight ½.)

3. How would you prepare a five per cent. solution of camphor in olive oil for hypodermic use? (Weight 2.)

Smith did not attempt 3, 4, or 5.

Jones: The olive oil should be heated to high temperature and then rubbed with Camphor in a warm mortar until the Camphor is dissolved.

Brown: Take my Camphor & powder up with a little alcohol & then gradually add my Olive Oil to it until it becomes all triturated do this in a glass mortar.

4. Should the oil be first sterilized for this purpose, if so, how would you do it? (Weight 1.)

Jones: The oil should be sterilized. Olive oil is sterilized by heating on a water bath until it boils. It is then removed and allowed to cool and then placed into container. (Weight ½.)

Brown: Yes—To do so place the oil into a bottle over a water bath. (Weight 1.)

5. If you have a prescription for sterilized petrolatum what would you dispense? (Weight 2.)

Jones offered no answer to this or to the next question.

Brown: I would dispense petrolatum which is in sealed bottles. (Weight 2.)

6. Why should the pharmacist be careful to cover up all vessels containing ointments? (Weight 2.)

Smith: Because there are so many germs in the air. That coming in contact with Ointment would form a poisonous germs and when coming in contact with an open cut may form Tetanus or other disease. (Weight 2.)

Brown: To prevent decomposition & exposure to air & light. (Weight 1.)

Total weight of question P, 10; made by Smith, 4½; by Jones, 3; by Brown, 5½.

Question Q.

R
 Tinct. Nucis Vom. ʒiiss
 Tinct. Cinchonae Comp ʒiiss
 Acid. Phos. dil ʒvi
 Tinct. Ferri Chlor ʒiiss
 Spt. Vin. Gallici ad ʒvi
 M. a dessertspoonful
 in water before meals
 5-24-93 Dr. Hill

1. In what system of weights is this written? (Weight 3.)

Smith: It is written in Old form weights or drachms. (Weight 3.)

Jones: Troy or Apothecaries. (Weight 3.)

Brown: Apothecaries. (Weight 3.)

2. How does it differ from that commonly employed for prescriptions of this character? (Weight 3.)

Smith: Prescriptions of this character the weights are written in Liquid form. Where in this Prescription it is written in drachms or solid form. (Weight 3.)

Jones did not offer anything in reply to this.

Brown: None.

3. Would you compound it by weight or measure? (Give reason for your answer.) (Weight 3.)

Smith: I would compound it by measure. (Because first it would measure more by weight—Second the Physician has forgot to write it correctly.) (Weight 3.)

Jones: Weight.

Brown: by measure as it calls for it—By weight you would have to weigh your container (The Bottle) Then place weights required. (Weight $2\frac{1}{2}$.)

4. Give English name and quantity of each ingredient that would be contained in each dose, if compounded by Apothecaries Fluid Measure. (Weight 5.)

Smith:

Tincture Nux Vomica	1 dose.
Tincture Cinchona Compound	Minims 3.
Acid Phosphoric Dilutum	3 ss.
Tincture Chloride Iron	Minims viii
Spirit Vini Gallici (Brandy)	min iv
	oz i
	(Weight $2\frac{1}{2}$.)

Jones:

Tincture Nux Vomica	3 min.
Tincture Cinchona Compound	34 min.
Dilute Phosphoric Acid	9 min.
Tincture Chloride Iron	4 min.
Brandy	1 dr. 9 min.
	(Weight $2\frac{1}{2}$.)

Brown did not attempt this.

5. What does "ad" mean in this prescription? (Weight 1.)

Smith: Ad means. To measure just exactly the quantity the physician wants. Or the addition of the liquid.

Jones did not undertake to say what "ad" means.

Brown: ad enough of the Brandy to make required amount which is six ounces. (Weight 1.)

Total weight of question Q, 15; Smith made $8\frac{1}{2}$ [?]. Jones, $5\frac{1}{2}$; Brown, $6\frac{1}{2}$.

Question R.

What are the following: (1) English salt. (2) Bitter salt. (3) French salt. (4) Salt of tartar. (5) Salt of Lemon. (6) Sour Salt. (7) Table salt. (8) Glauber salt. (9) Epsom salt. (10) Preston's salt. (Weight of each subdivision 1.)

Smith attempted only the following: (4) Potassium Carbonate. (5) Oxalic Acid. (6) Hydrochloric Acid. (7) Sodium Chloride. (8) Sodium Sulphate. (9) Magnesium Sulphate.

Jones: (1) Epsom Salt. Magnesium Sulphate. (2) Epsom Salt. Magnesium Sulphate. (3) (4) Potassium Carbonate. (5) Citric Acid. (6) Citric Acid. (7) Sodium Chloride. (8) Sodium Sulphate. (9) Magnesium Sulphate.

Brown: (1) Epsom Salts. (2) Epsom Salts. (3) Epsom Salts. (4) Potassium Carbonate. (5) Oxalic Acid. (6) Rochelle Salt. (7) Sodium Chloride. (8) Sodium Sulphate. (9) Magnesium Sulphate. (10) Epsom Salt.

Total weight of question R, 10; Smith made 4 (1 each on 4, 7, 8, and 9); Jones, 8 (all except 3 and 10); Brown, 7 (all except 3, 6 and 10).

Question S.

1. Name the source of Sodium Nitrate. (Weight $\frac{1}{2}$.)

Smith did not try any of question S.

Jones: Manure.

Brown: Found in Iron ores & Rocks.

2. Describe it. (Weight 1.)

Jones did not attempt this.

Brown: Its a whitish, granular powder. (Weight $\frac{1}{2}$.)

3. Give its medicinal properties and dose. (Weight 1.)

Jones: Diuretic 15 grs. (Weight $\frac{1}{2}$.)

Brown: 2 gr doses—nervousness.

4. How is Sodium Nitrite prepared? (Weight 1.)

Jones did not offer any answer to 4, 5, or 6.

Brown: Action of nitric acid on sodium.

5. The U. S. P. directs that the official salt should contain at least 90 per cent. of pure sodium nitrite; what does the other 10 per cent. consist of? (Weight 1.)

Brown: Sodium Nitrite a very white powder granular.

6. Describe Sodium Nitrite. (Weight 1.)

No answer to this, unless Brown's answer to 5 was intended for 6.

7. What effect has light and air upon it? (Weight 1.)

Jones: Sodium Nitrite absorbs moisture from the air and liquifies. (Weight 1.)

Brown: decomposes. (Weight $\frac{1}{2}$.)

8. How would you dispense it in capsules? (Weight 1.)

Jones: Sodium Nitrite may be dispensed in capsules by mixing it with Althea, or Tragacanth. (Weight 1.)

Brown: Make a mass form.

9. What effect has an acid upon it in solution? (Weight 1.)

Jones: An acid decomposes Sodium Nitrate in solution. (Weight $\frac{1}{2}$.)

Brown: Turn it to a darkish yellowish color. (Weight $\frac{1}{2}$.)

10. What are its medicinal properties and dose? (Weight $\frac{1}{2}$.)

Jones: Diuretic 15 grs.

Brown: No answer.

Total weight of question S, 10; Smith made 0; Jones, 3; Brown, $1\frac{1}{2}$.

Question T.

1. Give the official Latin name for licorice root. (Weight $\frac{1}{2}$.)

Smith: Glycyrrhiza. Radix. (Weight $\frac{1}{2}$.)

Jones: Glycyrrhizae Radix. (Weight $\frac{1}{2}$.)

Brown attempted only 4 and 9 of question T.

2. Name the botanical source of Spanish licorice root. (Weight $\frac{1}{2}$.)

Smith offered no answer to 2 and 3.

Jones: Glycyrrhizae glabra. (Weight $\frac{1}{2}$.)

3. Name the botanical source of Russian licorice root. (Weight $\frac{1}{2}$.)

Jones: Glycyrrhizae glandulifera. (Weight $\frac{1}{2}$.)

4. Give the medicinal properties of licorice. (Weight 1.)

Smith: Use in colds and coughs. (Weight $\frac{1}{2}$.)

Jones: Expectorant, demulcent. (Weight 1.)

Brown: Its used as an expectorant. (Weight 1.)

5. How is ammoniated Glycyrrhizin prepared? (Weight 1.)

Smith: By addition of Ammonia Water. (Weight $\frac{1}{2}$.) Jones turned in blank spaces on his answer sheet opposite 5, 6, 7, and 8.

6. How is fluidextract of licorice made? (Weight 2.)

Smith: By evaporating the root down and passing a Menstruum through it.

7. How is the official pure extract of liquorice made? (Weight 2.)

Smith did not try 7 and 8.

8. How is Purified Extract of Liquorice, N. F., made? (Weight $\frac{1}{2}$.)

This seems to have nonplussed all three.

9. Which of these should be used in making Brown Mixture? (Weight 2.)

Smith: Pure extract of licorice is used. (Weight 2.)

Jones: Extractum Glycyrrhizae Purum. (Weight 2.)

Brown: Purified extract of Licorice. (Weight 2.)

Total weight of question T, 10; Smith made $3\frac{1}{2}$; Jones, $4\frac{1}{2}$; Brown, 3.

Question U.

1. Give the official name of Thymol Iodide. (Weight 1.)

Smith attempted only 2 and 5 under this head.

Jones: Thymolis Iodidum. (Weight 1.)

Brown: Thymole Iodidi. (Weight 1.)

2. Under what trade name is it known? (Weight 1.)

Smith: Aristol. (Weight 1.)

Jones: Aristol. (Weight 1.)

Brown: Aristol. (Weight 1.)

3. What percentage of iodine should it contain? (Weight 1.)

Jones: 96%. (Weight 1.)

Brown: 2 %.

4. How would you detect rosin as an adulterant in it? (Weight 1.)

Jones gave it up.

Brown: Hydrochloric acid gives you a deep yellow color.

5. How would you detect the presence of tannin in it? (Weight 1.)

Smith: By a solution of iron. (Weight 1.)

Jones: By treating with Tincture Ferric Chloride. (Weight 1.)

Brown: Nitric Acid gives you Brown Color.

6. How would you detect sesquioxide of iron in it? (Weight 1.)

This stumped all three.

7. Name one or more of its best solvents. (Weight 1.)

Jones: Sulphur Dioxide.

Brown: Alcohol, Chloroform. (Weight 1.)

Total weight of question U, 7; Smith made 2; Jones, 4; Brown, 3.

Question V.

1. What is Tar? (Weight 1.)

Smith: Tar is a very heavy Black substance with a disagreeable odor.

Jones: A product obtained by the destructive distillation of the wood of Pinus Palustris. (Weight 1.)

Brown: A drug obtained by destructive distillation of wood.

2. *Give its official Latin title?* (Weight 1.)

Smith: Picis Liquidum. (Weight ½.)

Jones: Pix Liquida. (Weight 1.)

Brown: Picis Liquide. (Weight ½.)

3. *How is it obtained?* (Weight 1.)

Smith: Made from distillation of coal.

Jones: Obtained by destructive distillation.

Brown: used as an expectorant. (Weight ½.)

4. *What are its medical properties?* (Weight 1.)

Smith: For Coughs and Colds, and Plasters.

Jones: Diuretic, Diaphoretic, stimulant. (Weight 1.)

Brown: distillation of wood. [Brown seems to have a habit of getting his questions and answers mismatched. See question S, 5 and 6.]

5. *How is Oil of Tar obtained?* (Weight 1.)

Smith: By distillation of Crude tar. (Weight 1.)

Jones: Distillation. Obtained from Tar. (Weight 1.)

Brown: it will separate leaving the Tar on Top. (Weight ½.)

6. *Why should care be taken in not overheating Tar Ointment?* (Weight 2.)

Smith and Jones did not know and knew that they did not know.

Brown: it's a Tar product & obtained from the Tar.

7. *What is Oil of Cade and what is it obtained from?* (Weight 1.)

Smith gave it up.

Jones: A product of the dry distillation of the wood of *Juniperus oxycedrus*. (Weight 1.)

Brown—[See his answer to 6.]

Total weight of question V, 8; Smith made 1½; Jones, 5; Brown, 1½.

Question W.

1. *What is magnesium?* (Weight 1.)

Smith: Magnesium is a heavy metal. (Weight 1.)

Jones: Magnesium is an elementary substance. (Weight 1.)

Brown: its a chemical. (Weight ½.)

2. *What is magnesia?* (Weight 2.)

Smith: Magnesia is a light principle obtained from magnesium. (Weight ½.)

Jones did not attempt 2, 5 or 6.

Brown: its a drug.

3. *What is Magnesii Oxidum Ponderosum, U. S. P.?* (Weight 1.)

Smith: Heavy Magnesia. (Weight 1.)

Jones: Heavy Oxide of Magnesia. (Weight 1.)

Brown: Heavy Magnesia [naming a well-known brand]. (Weight 1.)

4. *How does it differ from Magnesii Oxidum, U. S. P.?* (Weight 1.)

Smith: It is not so light and flaky. (Weight 1.)

Jones: Differs in weight. (Weight 1.)

Brown: The Oxide is the light, the Magnesii Oxidum Ponderosum is the heavy. (Weight 1.)

5. *The U. S. P. directs that it should contain at least 96 per cent. of pure magnesium oxide; what, in your judgment, does the other 4 per cent. consist of?* (Weight 1.)

Smith and Jones skipped this.

Brown: Contains Calcined Magnesia.

6. *What is calcined magnesia?* (Weight 1.)

Smith: Light magnesia. (Weight 1.)

Brown: Magnesia Carbonate.

7. *State in detail how Solution of Magnesium Citrate is made in the store in which you are employed?* (Weight 1.)

Smith: Aqua Destill—is used Magnesium Carbonate Citric Acid—Let effervescence cease. Add Syrup Lemon. Water qs But put in of Potassium Bi Carbonate 40 grs Cork tightly and put on Ice. (Weight 1.)

Jones: 396 Gm. of Citric Acid and 180 Gm. of Magnesium Carbonate are placed in a container and to this is added 2880 C.C. of hot water. When the solution becomes cool it is divided into 12 equal parts. Then the Syr. of Citric Acid and Water is added. (Weight 1.)

Brown: I take my Magnesia Carbonate & my Citric Acid place into a suitable container add my water to it—Stand Aside until all is dissolved fill up to required amount—Then I take about ½ ounce Commercial Talcum place into my container Shake & Filter after filtering I take 24 Ounces of Syr. Citric Acid & place into my container Shake & Bottle. (Weight 1.)

8. *How much Magnesium Carbonate should be used for each bottle of this solution?* (Weight 1.)

Smith: Because it spoils or a fungi forms and becomes flakey. (Weight 1.)

Jones: 15 Gm. (Weight 1.)

Brown confessed his ignorance by ignorance.

9. *Why should it not be made in large quantities?* (Weight 1.)

Smith evidently intended his answer 8 for this question.

Jones: It does not keep. (Weight 1.)

Brown: it should always be made up Fresh.

Total weight of question W, 10; Smith made 6½; Jones, 6; Brown, 3½.

Question X.

1. *Name the plant yielding bitter orange peel.* (Weight ½.)

Smith turned in blank spaces for 1, 2, 3, 4, and 6.

Jones: Citrus Vulgaris. (Weight ½.)

Brown offered answers to only 5, 6, and 9.

2. *Name the plant yielding Sweet Orange Peel.* (Weight ½.)

Jones: Citrus Aurantium. (Weight ½.)

3. *Describe Bitter Orange Peel?* (Weight 1.)

No answer.

4. *Describe Sweet Orange Peel.* (Weight 1.)

No answer.

5. *In what preparation is Bitter Orange Peel used?* (Weight 1.)

Smith: In Tr. Gent. Comp. (Weight ½.)

Jones: Tr. Bitter Orange Peel. (Weight ½.)

Brown: Tincture.

6. *In what preparation is Sweet Orange Peel used?* (Weight 1.)

Jones: Tr. Sweet Orange Peel. (Weight 1.)

Brown: Syr. Aurantii. (Weight ½.)

7. *Which peel is obtained from the fresh ripe fruit?* (Weight 1.)

Smith: Sweet orange. (Weight 1.)

Jones: Sweet Orange Peel. (Weight 1.)

Brown let this go by.

8. *Which is obtained from the unripe fruit and what are its medical properties?* (Weight 1.)

Smith: Bitter Orange. (Weight ½.)

Jones: Bitter Orange Peel. M. P. refrigerant, stimulant, carminative. (Weight 1.)

9. *How is the official Syrup of Orange made?* (Weight 3.)

Smith: By letting the peel macerate in Alcohol so many days and taking off the tincture and making the syrup. From Granulated Sugar. (Weight 1.)

Jones: Syrup Orange is made from the Tincture Sweet Orange Peel and Syrup it is made by simple solution. (Weight 1.)

Brown: Citric Acid; Sugar; Magnesium Carbonate; Water. (Weight ½.)

Total weight of question X, 10; Smith made 3; Jones, 5½; Brown, 1.

Question Y.

1. *Why should arsenic trioxide be given after meals?* (Weight 1.)

Smith turned in answers to only 4, 5, 6, and 9.

Jones tried only 4, 5, 6, 9 and 10.

Brown: To give on an empty stomach might produce vomiting.

2. *Why does the administration of most organic acids render the urine alkaline?* (Weight 1.)

Brown: All organic acids turn urine alkaline.

3. *Why does the administration of benzoic acid make the urine acid?* (Weight 1.)

Brown: The benzoic acid it contains.

4. *Why is charcoal used as an antidote for poisoning by alkaloids?* (Weight 1.)

Smith: Because it renders them inert.

Jones: Charcoal combines with alkaloids rendering them insoluble. (Weight 1.)

Brown: It is a help in preventing the victim from dizziness, also the shivering and nervousness.

5. *Why is albumin a good antidote for poisoning by metallic salts?* (Weight 1.)

Smith: Because it takes up the metallic salts and renders them insoluble. (Weight 1.)

Jones: Albumin combines with metallic salts making them inactive and uninjurious. (Weight 1.)

Brown: Doesn't corrode the lining of the stomach. (Weight 1.)

6. *Why should an emetic be administered soon after giving albumin?* (Weight 1.)

Smith: To get it out of the stomach so that it will not change into another salt. (Weight 1.)

Jones: To remove the poisonous metallic salts. (Weight 1.)

Brown: to Produce Vomiting.

7. Why should an excess of albumin be avoided in poisoning by corrosive sublimate? (Weight 1.)

Brown: The antagonism with the corrosive sublimate.

8. Why is hydrastin specified "White alkaloid"? (Weight 1.)

Brown did not undertake to answer 8. or 9.

9. Why is Jamaica ginger coated with lime? (Weight 1.)

Smith: To keep insects away. (Weight 1.)

Jones: To preserve it and to protect it from insect bites. (Weight 1.)

10. Why does powdered mustard not give a blue color with iodine? (Weight 1.)

Jones: Powdered mustard does not give a blue color with iodine because it does not contain starch. (Weight 1.)

Brown: does not Contain Starch. (Weight 1.)

Total weight of question Y, 10; Smith made 3; Jones, 5; Brown 2.

Question Z.

1. What earthy salts enter into the composition of bone? (Weight ½.)

Neither Smith nor Brown tried any of question Z; Jones gave an answer to 1 only, as follows:

Calcium; Sodium, Magnesium. (Weight ½.)

2. What is the central and what is the peripheral nervous system? (Weight ½.)

3. Name the different parts of the alimentary tract beginning at the mouth. (Weight 1.)

4. What three classes of food are necessary to man? (Weight ½.)

5. What kind is digested in the stomach? (Weight ½.)

6. Upon what kinds of food does the pancreatic juice act and what enzymes are found in that secretion? (Weight 1.)

7. Locate the thyroid and suprarenal glands in the human body. (Weight ½.)

8. What secretion is produced by the liver and where does it enter the alimentary tract? (Weight 1.)

9. What is the rate of respiration per minute and what is the difference in composition of the inspired and expired air. (Weight ½.)

Total weight of question Z, 6; Smith made 0; Jones, ½; Brown, 0.

Identification of Specimens.

Each candidate was asked to "write the unabbreviated official name of each" of the specimens. Their answers follow:

Smith: (1) Tr. Quassia. (2) Spirit Camphorae. (3) Spirit Nitre Sweet. (4) Syrup Prunus Virginiae. (5) Conium Seed. (6) Caraway Seed. (7) Anise Seed. (8) Fennell Seed. (9) Buchu Leaves. (10) Uva Ursae.

Jones: (1) Acetum Scillae. (2) Tinctura Camphorae. (3) Spiritus Aetheris Nitrosi. (4) Syrupus Prunus Virginianae. (5) Strophanthus Kombe. (6) Foeniculum Vulgare. (7) Pimpinella Anisum. (8) Carum Carvi. (9) Barosma Betulina. (10) Jaborandi.

Brown: (1) Tr. Nux Vomica. (2) Spts. Camphor. (3) Sweet Spirits Nitre. (4) Syr. Wild Cherry. (5) Caraway Seed. (7) Anise Seed. (8) Fennel Tea. (9) Small Buchu. (10) Senna Leaf.

Total weight of this feature of the examination, 10 (1 for each specimen); Smith made 10; Jones 7; Brown, 7.

Total weight of questions A to Z inclusive, 250; Smith made 97½, equal to 39 per cent.; Jones, 145, equal to 58 per cent.; Brown, 66, equal to 26 per cent.

PRACTICAL EXAMINATION.

THE STATE PHARMACEUTICAL EXAMINING BOARD OF PENNSYLVANIA.

FOR REGISTERED PHARMACIST CERTIFICATE.

Laboratory No. —

RULES: Do not write anything on the label but your laboratory number. Write directions on this sheet.

After finishing your preparations, answer the questions on this sheet and hand both to the examiner in charge.

You are rated for accuracy, neatness, dispatch and finished product. Time allowed for this examination is two (2) hours. Read questions carefully before you proceed. You are allowed One Trial Only. Do not throw your preparation away if you spoil it.

Task A.

HENRY BEATES, JR., M. D.
260 SOUTH 10TH STREET
PHILADELPHIA
BELL PHONE SPRUCE 38-03

NOTE—This prescription is only for the person named hereon, and is ordered for the conditions existing at the time of consultation: it is, therefore, not to be renewed or a copy given without my written consent.

R

Pil. Ferri Carb. gr. iij. No. X

1. One before meals and

before retiring.

7/30/11

CALLS DELIVERED BEFORE 10 A. M. RECEIVE ATTENTION THAT SAME DAY.

Beates

P. S.

PILULÆ FERRI CARBONATIS, U. S. P.

Granulated Ferrous Sulphate.....	16 Gm.
Potassium Carbonate.....	8 Gm.
Sugar	4 Gm.
Tragacanth	1 Gm.
Althea	1 Gm.
Glycerin	
Water, each q.s.	

To make 100 pills.

1. State how you made these pills. Give reasons for using this procedure.

Smith: Take potassium carbonate grs 7, and rub it with Glycerine & Water qs. Add Ferrous Sulphate grs 19— and Sugar grs iij let stand till it assumes a green color, then add Althea and Tragacanth aa grs ss to make Pills No. X each weighing grs iij.

Jones did not divulge his procedure or the reason for using it.

Brown: Rub my Ferrous Sulphate with Potassium Carbonate Then my Sugar & Tragacanth and my Althea— Then took my Glycerin and water to make my Mass and divided them off into (10) pills of 3 gr each.

2. Give quantities of each ingredient used.

Smith answered this by writing his figures opposite the printed quantities in the examination sheet. Opposite 16 Gm. he wrote 19 grs.; 8 Gm., 7 grs.; 4 Gm., 3 grs.; 1 Gm., ½ gr.; 1 Gm., ½ gr.

Jones wrote the names of the ingredients with the quantities after them, his results being as here set forth: 16 Gm., 12 grs.; 8 Gm., 6 gr.; 4 Gm., 3 gr.; 1 Gm., 1 gr.; 1 Gm., 1 gr.; Glycerine, 5 min.; Water, 16 min.

Brown followed Smith's plan. His figures were: 16 Gm., 24 grs.; 8 Gm., 12 grs.; 4 Gm., 6 grs.; 1 Gm., 1½ grs.; 1 Gm., 1½ grs.

3. Write directions here.

Smith: Rub the Potassium Carbonate with Glycerine & Water, add the Granulated Ferrous Sulphate and Sugar. Let stand till it obtains a greenish color. Then add Tragacanth and Althea to make pills No. X.

Jones: One (1) before meals and before retiring.

Brown: One (1) before meals and before retiring.

Task B.

1. State briefly how you compounded this prescription and why you used this procedure. [For the prescription, see opposite page.]

Smith: Rub the Potass Chlorate till fine powder place in Bot add Tr. Ferri Chlor. To form Chlorine gas Add oz ss Water to dissolve Pot Chlorat add Glycerine and water and lastly Hydrochl Acid Shake Well.

Jones: Potassium Chlorate is put into a bottle to this is added Hydrochloric Acid to liberate the — [this word is so indistinctly written as to leave doubt as to what it is; it may be "five," "pure" or "free"] Oxogen. A little water is then added, this is followed by the addition of Tr. Ferric Chloride and Glycerine and then sufficient water is added.

Brown: I took my Potass Chlorat added my Ac. Hydrochlor set aside to let gas escape added my Tr. Ferri Chl. then my glycerin & Lastly my water of which was sufficient quantity for the two ounces.

GEORGE B. MILLER, M. D.
634 DIAMOND STREET
PHILADELPHIA

OFFICE HOURS:
UNTIL 9 A. M.
2 TO 3 P. M.
6 TO 7.30 P. M.
SUNDAY, UNTIL 9 A. M. ONLY.
BELL TELEPHONE

R Potass Chlorat 3i ss

M. Sig. 3i in 3pk of water every 3 hrs Miller

This is the prescription referred to under "Task B," opposite page.

2. Write directions here.

Smith: Teaspoonful in tablespoonful of water every three hours.

Jones: One (1) teaspoonful in a tablespoonful of water every three (3) hours. Miller.

Brown: One (1) teaspoonful in Tablespoonful of water every three hours. Dr. Miller.

R Ext. Bellad 1.05

Camphora 2.

Acetanilid 1.

Sacchar Alb. 2.

Met ft. Chl. # X.

I One every 2

hours Applebach
2/10/10

Prescription referred to under "Task C," above.

Task C.

1. State briefly how you compounded this prescription.
[For the prescription, see below.]

Smith: Rub the Ext. Bellad with the Camphor, and then add the Sugar, and thoroughly incorporate till fine powder then add the acetanilid. And Triturate till thoroughly incorporated And then divided into Ten powders.

Jones: Dissolve Camphor by a little alcohol, add Extract Belladonnae, and then add Sugar and Acetanilid in successive portions.

Brown: Powder my camphor add my Belladonna Then add my Acetanilid Lastly my sacch. alb. Divide them into required amount powders.

2. Write directions here.

Smith: One every 2 hours.

Jones: One every two (2) hours. Applebach.

Brown: One (1) every two (2) hours. Dr. Applebach.

Task D.

Determine the percentage of Alcohol present in sample of wine.

PROCESS:

Take the specific gravity (to 3 decimals) of a carefully measured portion of the wine; evaporate this to about one-third of its original weight, cool and add water until liquid measures its original volume and take its specific gravity (to 3 decimals). The difference between the two specific gravities, deducted from 1,000 corresponds to the specific gravity of an alcohol containing the same percentage of absolute alcohol, as wine under examination, the corresponding percentage being ascertained by referring to the alcohol table.

Per cent. by wt. abs. alc.	Sp. gr. 15.6° C.	Per cent. by wt. abs. alc.	Sp. gr. 15.6° C.	Per cent. by wt. abs. alc.	Sp. gr. 15.6° C.

13.....	0.9800	27.....	0.9621		
14.....	0.9788	28.....	0.9606		

Make all calculations on this sheet. Show all figures.

None of the three attempted this.

As above stated, those who did the practical work were rated on accuracy, neatness, dispatch and product. For each of the four tasks accuracy was weighted 1½; neatness, 1½; dispatch, 1½; and product, 20—a total of 25, or 100 for the four. The ratings of the three candidates on this part of their examinations were—

Smith: Task A—Accuracy, ½; neatness, 1½; dispatch, ½; product, 12; total, 15. Task B—Accuracy, 1½; neatness, 1½; dispatch, 1; product, 14; total, 17½. Task C—Accuracy, 1½; neatness, 1½; dispatch, ½; product, 10; total, 13½. Task D—Accuracy, 1½; neatness, 1½; dispatch, ½; product, 0; total, 4½. [?] Total on practical work, 50.

Jones: Task A—Accuracy, 1½; neatness, 1½; dispatch, ½; product, 0; total 3½. Task B—Accuracy, 1½; neatness, 1½; dispatch, ½; product, 18; total, 22½. Task C—Accuracy, 1½; neatness, 1½; dispatch, 1½; product, 20; total, 25. Task D—0. Total on practical work, 50.

Brown: Task A—Accuracy, 1½; neatness, 1½; dispatch, 1½; product, 2; total, 7. Task B—Accuracy, 1½; neatness, 1½; dispatch, 1½; product, 18; total, 23. Task C—Accuracy, 1½; neatness, 1½; dispatch, 1½; product, 12; total, 17. Task D—0. Total on practical work, 47.

On the final rating Smith made, on answers, 39 per cent.; on work, 50 per cent.; average, 44.5 per cent.; on identification of specimens, 10 per cent.; total, 54.5.

Jones made, on answers, 58 per cent.; on work, 50

per cent.; average, 54 per cent.; on identification of specimens, 7 per cent.; total, 61 per cent.

Brown made, on answers, 26 per cent.; on work, 47 per cent.; average, 36.5 per cent.; on identification of specimens, 7 per cent.; total, 43.5 per cent.

None of the three candidates passed.

Curious Answers to Board Questions.

Below are reproduced some of the answers received by the board of pharmacy of a Southern State at a recent examination:

Spirits mindereris is oil peppermint.
Black wash is plumbi calcis.
Black wash is lotio plumbi acetate.
Cascara sagrada—official name amalga.
Ceratis are chalk mixtures.
Ozone is a solid.
Hydrogen is air.
Gray powder is Dover's powder.
Gray powder is plumbi subacitatis.
Nitrate silver is official preparation of metallic mercury.
Basham's mixture is liquor ammoni arsenic et hydrar-
geri iodide.

Fining a Poisoner.*

A local whisky dealer pleaded guilty in the court of special sessions on Monday to selling wood alcohol as whisky, and was fined \$250. This isn't comic opera civilization, as a stranger might be excused for assuming, but the real thing as we practice it in the largest city of the country at the end of a dozen or more years of active crusading for pure food and drink.

It is common knowledge that wood alcohol is a deadly poison. One of the effects upon consumers it fails to kill is permanent blindness. The sale of wood alcohol as whisky is little different in character, so far as danger to the purchaser is concerned, from the sale of strychnine as baking powder, or arsenic as breakfast food. All three of these substances are, in small amounts, insidious poisons, and in larger quantities rapidly fatal.

So long as this slipshod and really imbecile method of warfare against dangerous adulteration is continued there is little hope of improvement. For such an offense as selling poison in whisky any fine is an absurdly inadequate penalty. A considerable term in jail should be the least possible punishment.

"Sal Vet."

Sal vet "a highly medicated salt," exploited at the rate of \$5 per 100 pounds, as a destroyer of worms in stock and a "reliable conditioner and tonic for sheep, hogs, horses and cattle" was analyzed in the laboratory of the North Dakota department of agriculture. The analyst reported that the preparation contains "93.43 per cent. of common salt . . . to which has been added a small quantity of iron sulphate with enough charcoal to blacken the entire mass, and small quantities of crude gentian and quassia."

Plectranthin.

Yagi (*Arch. internat. de pharm. et therap.*) has examined plectranthus glaucocalis, a plant growing in southern Japan and used extensively for the treatment of stomach troubles. He has succeeded in isolating a bitter principle which he has called plectranthin. It occurs as long, fine needles, melting at 220°, and possesses the formula $C_{25}H_{54}O_8$.

* From the New York Globe.

Some Horticultural Helps.

Druggists who wish to profit by helping gardeners fight the pests of bugs and weeds will doubtless be interested in the appended formulas garnered from various sources:

BORDEAUX MIXTURE.

Copper sulphate..... 5 pounds.
Quicklime 5 pounds.
Water 50 gallons.

Dissolve the copper sulphate in 10 gallons of water; slake the lime in half a barrel of water. Dilute the copper solution to 20 gallons, strain in the lime mixture, and dilute to 50 gallons.

SELF-BOILED LIME AND SULPHUR SPRAY.

Quicklime 10 pounds.
Sulphur 10 pounds.
Water 50 gallons.

Put the lime with 1 gallon of water in a barrel; add the sulphur; stir, and add enough water to make a thin paste. Stir vigorously until the ebullition subsides to slight proportions; and dilute to 50 gallons.

WEED KILLERS.

I.

Potassium dichromate..... 5 pounds.
Water 15 gallons.

II.

Sodium chloride..... 3 pounds.
Chrome alum..... 2 pounds.
Water 15 gallons.

III.

Ferrous sulphate..... 5 pounds.
Water 15 gallons.

ROSIN WASH.

Rosin 4 pounds.
Soda lye (78%)..... 4 pounds.
Fish oil..... 8 ounces.
Water..... enough to make 20 gallons.

Boil the rosin with the lye, the oil and a couple of quarts of water until a dark coffee-colored liquid is obtained. Dilute to 5 gallons with hot water to make the stock solution which is diluted 1 to 3 for use.

LIME ARSENITE SPRAY.

(a) Arsenic trioxide..... 1 pound.
Sodium carbonate..... 4 pounds.
Water 1 gallon.

Boil together for twenty minutes replacing the water evaporated. Stock solution.

(b) Quicklime 24 pounds.
Water 4 gallons.

To be freshly prepared.

For use, the lime mixture is mixed with water in the proportion of 1 in 40; and to each 40 gallons of this dilution 1 pint of stock solution *a* is added.

RED OIL EMULSION.

Red oil..... 2 gallons.
Hard laundry soap..... 1 pound.
Sodium carbonate..... 1 ounce.
Water..... enough to make 30 gallons.

Boil the soap and the sal soda in 1 gallon of water until dissolved; remove from the fire; add the oil; re-apply heat until boiling ensues, agitate until emulsified. For use, dilute to 30 gallons.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Prof. Coblentz's Resignation.

New York, May 24th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Upon reading your editorial on page 237 of the May number, I note that you are evidently under the impression that the retirement of Prof. Coblentz from the New York College of Pharmacy was, or may have been, influenced by his connection with the crusade of the New York *World* against the reputation of the pharmacists of this city. Since this idea has frequently been expressed in various directions by others, I think it just and proper to say through the CIRCULAR that there was no connection whatever between the two events. Early in the academic year of 1910-11, Mr. Theodore Weicker, on behalf of Messrs. Squibb & Co., informed me of the contemplated engagement of Prof. Coblentz as chemist for that house, in order that the college might not be found entirely unprepared for the change. Prof. Coblentz's retirement was wholly the result of the carrying out of this arrangement.

H. H. RUSBY,
Dean.

[This letter was received after the pages of our June number devoted to "Correspondence" had been made ready for the press. We were well aware when we wrote the article in question that Prof. Coblentz had resigned his position at the college, or had determined to do so, before engaging in the "crusade" referred to, and nowhere in that article, so far as a careful rereading of it reveals, is it intimated or implied that his resignation was brought about by his connection with the "crusade." However, we are pleased to give space to Dean Rusby's letter and to lay before our readers the statements made therein.—Editor THE DRUGGISTS CIRCULAR.]

A College Graduate Objects to Extra-pharmaceutical Work.

Schenectady, N. Y., June 12th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Many people believe that if a man—I refer to the city man—really wants to enjoy life and occupy a high position in the community because of his professional standing, only one place exists, and that is the country. Let me say from what I have seen of the so-called drug life here, this is not so.

I have worked in New York city for the past eight years, and owing to the fact that I thought I would enjoy a change I accepted a position in this town. Now I have gone "through the mill" and have had a decent taste of the country from its green environments and other forms of shrubbery up to its extreme lonesomeness and periods of solitude. For to work in a country store, no matter how large it may be, requires no extra skill and certainly no college train-

ing; for what layman could not hand over the counter, at the public request, a bottle of Doctor Kilem & Takem's heart cure, or sell a penny's worth of school supplies, or a can of varnish and all such junk.

It is no wonder that all or almost all the letters written your paper and other drug journals bear strong "kicks" against prerequisite college training, and they all come from country "rubes." Since I have been here—it's already four weeks—we have not had a single prescription.

I will conclude by saying that any man who has gone through a respectable college training should stick to a large city and practice more of real pharmacy and less of hardware and general candy business and steer clear of the small towns. Let me hear through your paper what others have to say in this respect.

SAMUEL H. FRITZ.

Diagnosis First; then Materia Medica.

Brooklyn, N. Y., June 13th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Please allow me to suggest a field of labor for our good friend, the propaganda specialist—a field that should yield a manifold harvest—and, incidentally, give a little advice to the younger medical practitioner.

The field embraces the medical college and general hospital.

The advice is, Stand on your own feet.

Time and again I have noted the young practitioner asking for Florist's hydriodic acid, Brother's hypophosphites, or Lamplighter's misterine. His preceptor and professors have told him they were good. I will admit that many of these preparations are good and have come to be recognized as products of high standard and, being made by experts, with the latest improved facilities, are not likely to vary. But specifying them all the time is getting the young doctor into a bad habit—a habit that will grow. And later, when he is away from the older heads, instead of spending his time studying true materia medica and writing prescriptions for drugs that will meet the particular needs of his patient, he reads a few pages of a stranger's flowery statement that would take first prize in a literary show, counts the number of testimonials, writes a prescription for some proprietary with a nice euphonious name and—the patient gets well in spite of the medicine.

How much better it would be if he had followed the lead of our government, recognized the Pharmacopœia as the standard, and written in good clear hand after the name of a preparation of known strength and therapeutic value the three letters, "U. S. P."? Wouldn't that boost his manhood a peg?

Thanks, Mr. Editor, for your patience. I have relieved my mind and now I feel better. Good night.

F. W. SCOTT, JR.

Information Wanted.

Spring Valley, Ill., May 17th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Can you tell us the names of cities which have ordinances—

(1) Prohibiting the house-to-house distribution of medicine samples.

(2) Prohibiting the advertisement and sale of "soothing syrups" containing opium, etc.

(3) Prohibiting the advertising or display of female remedies and remedies for venereal diseases.

We wish to write the city clerk or attorney at these places for copies of these ordinances to use in drawing up similar local ones.

THE THOMPSON DRUG COMPANY.

[From time to time we have printed information on these subjects, but have no such list of cities as is requested. We hope each of our readers who lives in a city having any such ordinances will communicate direct with our correspondent. Looking hurriedly through our files for the past fifteen years, we find references to the subject in the issues of the CIRCULAR mentioned, as herewith summarized:

1907, May, page 396, ordinance at East Orange, N. J.; 1906, May, page 191, ordinance at Grand Rapids, Mich.; September, page 346, child killed in Ontario; 1905, June, page 213, law wanted in Indiana; August, page 291, ordinance at Houston, Texas; December, page 450, police ordered to stop distribution of a headache powder at Rochester, N. Y.; 1903, June, page 113, editorial on a New York State law; 1902, August, page 156, editorial, child made sick at Meriden, Conn.; November, page 222, editorial on an Ohio law; 1901, July, page 135, editorial on a Wisconsin law; 1900, February, page xix, quotations from Scranton and Harrisburg papers; March, page xxxv, ordinance wanted by Milwaukee paper; 1899, February, page 23, editorial on "Danger of Medicine Samples"; April, page lv, Leavenworth (Kan.), children made sick; Santa Rosa, Cal., wants ordinance; 1897, January, page ii, complaints from Buffalo; 1896, page ii, complaints from Columbus.

News has just come to hand that orders have been issued by the health commission of Denver for the arrest on sight of distributors of free samples of medicines.—Editor THE DRUGGISTS CIRCULAR.]

Anonymous Correspondence.*

Changes Noted in the Circular.

Down in Sunny Tennessee.

My Dear Old Sport:

I have been taking your old journal a long time; in fact I have grown grey or gray, I don't know which, or both, taking it; anyhow, my whiskers and hair are whiter than they were when I began taking it; have recently cut off part of the whiskers but still take the whole of the CIRCULAR—imperfections and all.

Times change, men change with them, and I suppose drug journals and their editors have a right to "flop over" occasionally, and now here comes along the staid and stolid old DRUGGISTS CIRCULAR, that I have known subscriptionally for a whole generation (33 years), and during all that time has fit, cussed and cried about anonymous letters being sent in for publication, a-telling everybody that they (the letters) would be filed straightway in the waste basket, and sent at once to the crematory, when lo and behold, here comes the June, 1911, number, with an editorial-ette of about a column in length, asking that as many

* In the CIRCULAR for last month, page 290, we requested readers to send us their opinions of the CIRCULAR, withholding their names if they desired. We invited all who "had a kick coming" to work it off and send the result to us, assuring them that it would have a respectful hearing. The invitation is held open for another month.—Editor THE DRUGGIST CIRCULAR.

of its readers as can do so, favor it with an anonymous letter.

Old Opportunity has called and found me with my pen in hand, and if this deponent could only send you a slice of the weather he is now enduring while trying to embrace old "Opty" you would not need anything else to warm your cockles or melt your hard heart, either. A few years since you offered your readers a chance of telling you what they thought of you, but they were required to do so over their own cognomens, and I wrote you, I thought some of your editorials were good, that I thought the "Notes and Queries" column had been of some advantage to me, and the information gained from that department was possibly worth the subscription price to any subscriber; and I believe some other points were mentioned, but, of course, that was over my own signature. Since that time I have changed my mind and will take advantage in this anonymous letter to say that I find your old editorials much better, the "Notes and Queries" column has gone into *pages*, and each issue is worth the year's subscription. You have recently added a soda-water department, and there are a lot of things that ought to be done, but you seem to be "getting on to" the job pretty well, so I will leave you in charge a while longer.

From your old friend,

A. N. ONYMOUS:

"Let All the Ends Thou Aim'st At," Etc.

From the Coal Regions.

To the Iconoclasticest Editor:

As I took up the CIRCULAR for June and tore off the wrapper, I said: "Well, I believe this is about the best *all-round* pharmaceutical journal. Some there are excellent in certain ways, but this is about the best *all-round* one." On opening it I saw your request for anonymous opinions, so I concluded to send the above. I take ten or twelve, so have a fair idea. I have always liked your fearless, independent editorials, aiming for the *truth*. They are always timely, too. The practical matter is good. It is well printed. Its illustrations are always attractive and more would help, but are not absolutely needed when the matter is so good.

PARK PHARMACIST.

Cement for Wooden Vessels.

Cracks in barrels, tubs, tanks, or other wooden vessels may be satisfactorily filled with a preparation made as follows:

Lard	6 pounds.
Common salt.....	4 pounds.
Beeswax	3½ pounds.
Sifted wood ashes.....	4 pounds.

Melt the wax with the lard over a gentle heat; add the salt and mix thoroughly, then stir in the ashes. The cement is to be applied hot.

Emulsion of Sesame Oil.

Arloing recommends (*Prescriber*) the following ingredients and proportions in making an emulsion of sesame oil sometimes prescribed in the treatment of diabetes:

Sesame oil.....	600 grammes.
Water	300 grammes.
Solution of sodium hydroxide	
(29 per cent.).....	6 c.c. (mils.)

Decision of the United States Supreme Court in the Johnson "Cancer Cure" Case.

On May 29th the United States supreme court rendered a decision in the Johnson "cancer cure" case which sustains the contention of the defendant that the pure food and drugs law does not apply to statements made on labels as to the curative properties of medicines. Three of the justices dissented.

The opinion of the court, delivered by Justice Holmes, follows:

This is an indictment for delivering for shipment from Missouri to Washington, D. C., packages and bottles of medicine bearing labels that stated or implied that the contents were effective in curing cancer, the defendant well knowing that such representations were false. On motion of the defendant the District Judge quashed the indictment (17 Fed. Rep. 313), and the United States brought this writ of error under the act of March 2, 1907, c. 2564, 34 Stat. 1246.

The question is whether the articles were misbranded within the meaning of section 2 of the food and drugs act of June 30th, 1906, making the delivery of misbranded drugs for shipment to any other State or Territory or the District of Columbia a punishable offense. By section 6 the term drug includes any substance or mixture intended to be used for the cure, mitigation or prevention of disease. By section 8 the term "misbranded" shall apply to all drugs or articles of food, * * * the package or label of which shall bear any statement, design or device regarding such article, or the ingredients or substances contained therein which shall be false or misleading in any particular, and to any food or drug product which is falsely branded as to the State, Territory or country in which it is manufactured or produced. * * * An article shall also be deemed to be misbranded: In case of drugs—First, If it be an imitation of or offered for sale under the name of another article. Second, (in case of a substitution of contents), or if the package fail to bear a statement on the label of the quantity or proportion of any alcohol, morphine, opium, cocaine, heroin, alpha or beta eucaine, chloroform, cannabis indica, chloral hydrate or acetanilid, or any derivative or preparation of any such substance contained therein."

It is a postulate, as the case comes before us, that in a certain sense the statement on the label was false, or, at least misleading. What we have to decide is whether such misleading statements are aimed at and hit by the words of the act. It seems to us that the words used convey to an ear trained to the usages of English speech a different aim; and although the meaning of a sentence is to be felt rather than to be proved, generally and here the impression may be strengthened by argument, as we shall try to show.

We lay on one side as quite unfounded the argument that the words "statement which shall be misleading in any particular" as used in the statute do not apply to drugs at all—that the statements referred to are those "regarding such article," and that "article" means article of food, mentioned by the side of drugs at the beginning of the section. It is enough to say that the beginning of the sentence makes such a reading impossible, and that article expressly includes drugs a few lines further on in what we have quoted, not to speak of the reason of the thing. But we are of opinion that the phrase is aimed not at all possible false statements, but only at such as determine the identity of the article, possibly including its strength, quality and purity, dealt with in section 7. In support of our interpretation the first thing to be noticed is the second branch of the sentence: "Or the ingredients or substances contained therein." One may say with some confidence that in idiomatic English this half, at least, is confined to identity, and means a false statement as to what the ingredients are. Logically it might mean more, but idiomatically it does not. But if the false statement referred to is a misstatement of identity as applied to a part of its objects, idiom and logic unite in giving it the same limit when applied to the other branch the article, whether simple or one that the ingredients compose. Again, it is to be noticed that the cases of misbranding, specifically mentioned and following the general words that we have construed, are all cases analogous to the statement of identity and not at all to inflated or false commendation of wares. The first is a false statement as to the country where the article is manufactured or produced; a matter quite unnecessary to specify if the preceding words had a universal scope, yet added as not being within them. The next case is that of imitation and taking the name of another article, of which the same may be said, and so of the next, a substitution of contents. The last is breach of an affirmative requirement to disclose the proportion of alcohol and certain other noxious ingredients in the package—again a matter of plain past history concerning the nature and amount of the poisons employed, not an estimate or prophecy concerning their effect. In further confirmation, it should be noticed that although the indictment alleged a wilful fraud, the shipment is punished by the statute if the article is misbranded, and that the article may be misbranded without any conscious fraud at all. It was natural enough to throw this risk on shippers with regard to the identity of their wares, but a very different and unlikely step to make them answerable for mistaken praise. It should be noticed still further that by section 4 the determination whether an article is misbranded is left to the bureau of chemistry of the department of agriculture, which is most natural if the question concerns ingredients and kind, but hardly so as to medical effects.

To avoid misunderstanding we should add that, for the purposes of this case, at least, we assume that a label might be of such a nature as to import a statement concerning identity, within the statute, although in form only a commendation of the supposed drug. It may be that a label in such form would exclude certain substances so plainly to all common understanding as to amount to an implied statement of what the contents of the package were not; and it may be that such a negation might fall within the prohibitions of the act. It

may be, we express no opinion upon that matter, that if the present indictment had alleged that the contents of the bottles were water, the label so distinctly implied that they were other than water, as to be a false statement of fact concerning their nature and kind. But such a statement as to contents, undescribed and unknown, is shown to be false only in its commendatory and prophetic aspect, and as such is not within the act.

In view of what we have said by way of simple interpretation we think it unnecessary to go into consideration of wider scope. We shall say nothing as to the limits of constitutional power, and but a word as to what congress was likely to attempt. It was much more likely to regulate commerce in food and drugs with reference to plain matter of fact, so that food and drugs should be what they professed to be, when the kind was stated, than to distort the uses of its constitutional power to establishing criteria in regions where opinions are far apart. See *School of Magnetic Healing vs. McAnnulty*, 187 U. S. 94. As we have said above, the reference of the question of misbranding to the bureau of chemistry for determination confirms what would have been our expectation and what is our understanding of the words immediately in point.

Judgment affirmed.

DISSENTING OPINION.

The dissenting opinion was delivered by Justice Hughes, Justices Harlan and Day concurring. The text follows:

I am unable to concur in the judgment in this case for the following reasons:

The defendant was charged with delivering for shipment in interstate commerce certain packages and bottles of drugs alleged to have been misbranded in violation of the food and drugs act of June 30th, 1906, chapter, 2915, 34 Stat. 768.

The articles were labeled respectively "Cancerine tablets," "Antiseptic tablets," "Blood purifier," "Special No. 4," "Cancerine No. 17," and "Cancerine No. 1,"—the whole constituting what was termed in substance "Dr. Johnson's Mild Combination Treatment for Cancer." There were several counts in the indictment with respect to the different articles. The labels contained the words "Guaranteed under the pure food and drugs act, June 30th, 1906"; and some of the further statements were as follows:

"Blood Purifier. This is an effective tonic and alterative. It enters the circulation at once, utterly destroying and removing impurities from the blood and entire system. Acts on the bowels, kidneys and skin, eliminating poisons from the system, and when taken in connection with the mild combination treatment gives splendid results in the treatment of cancer and other malignant diseases. I always advise that the blood purifier be continued some little time after the cancer has been killed and removed and the sore healed."

"Special No. 4. * * * It has a strong stimulative and absorptive power; will remove swelling, arrest development, restore circulation, and remove pain. Is indicated in all cases of malignancy where there is a tendency of the disease to spread, and where there is considerable hardness surrounding the sore. Applied thoroughly to a lump or to an enlarged gland will cause it to soften, become smaller and be absorbed."

"Cancerine No. 1. * * * Tendency is to convert the sore from an unhealthy to a healthy condition and promote healing. Also it destroys and removes dead and unhealthy tissue."

In each case the indictment alleged that the article was "wholly worthless," as the defendant well knew.

In quashing the indictment the district court construed the statute. The substance of the decision is found in the following words of the opinion: "Having regard to the intendment of the whole act, which is to protect the public health against adulterated, poisonous and deleterious food, drugs, etc., the labeling or branding of the bottle or container, as to the quantity or composition of the ingredients or substances contained therein which shall be false or misleading," by no possible construction can be extended to an inquiry as to whether or not the prescription be efficacious or worthless to effect the remedy claimed for it." And the question on this writ of error is whether or not this construction is correct. *United States vs. Keitel*, 211 U. S. 370.

What then is the true meaning of the statute?

Section 8 provides:

"Sec. 8. That the term 'misbranded,' as used herein, shall apply to all drugs, or articles of food, or articles which enter into the composition of food, the package or label of which shall bear any statement, design or device regarding such article, or the ingredients or substances contained therein which shall be false or misleading in any particular, and to any food or drug product which is falsely branded as to the State, Territory or country in which it is manufactured or produced."

The words "such article" in this section, as is shown by the immediate context, refer to "drugs" as well as to "food." "Drugs" are thus defined in section 6:

"Sec. 6. That the term 'drug,' as used in this act, shall include all medicines and preparations recognized in the United States Pharmacopoeia or National Formulary for internal or external use, and any substance or mixture of substances intended to be used for the cure, mitigation, or prevention of disease of either man or other animals."

Articles, then, intended to be used for curative purposes, such as those described in the indictment, are within the statute, though they are not recognized in the United States Pharmacopoeia or the National Formulary. And the offense of misbranding is committed if the package or label of such an article bears any statement regarding it "which shall be false or misleading in any particular."

But it is said that these words refer only to false statements which fix the identity of the article. According to the construction placed upon the statute by the court below in quashing the indictment, if one puts upon the market in interstate commerce, tablets of inert matter, or a liquid wholly worthless for any curative purposes as he well knows, with the label "Cancer Cure" or "Remedy for Epilepsy," he is not guilty of an offense, for in the sense attributed by that con-

struction to the words of the statute he has not made a statement regarding the article which is false or misleading in any particular.

I fail to find a sufficient warrant for this limitation, and, on the contrary, it seems to me to be opposed to the intent of congress and to deprive the act of a very salutary effect.

It is strongly stated that the clause in section 8—"or the ingredients or substances contained therein"—has reference to identity and that this controls the interpretation of the entire provision. This, in my judgment, is to ascribe an altogether undue weight to the wording of the clause and to overlook the context. The clause, it will be observed, is disjunctive. If congress had intended to restrict the offense to misstatements as to identity, it could easily have said so. But it did not say so. To a draftsman with such a purpose the language used would not naturally occur. Indeed, as will presently be shown, congress refused with the question up, so to limit the statute.

Let us look at the context. In the very next sentence, the section provides (referring to drugs) that an article shall "also" be deemed to be misbranded if it be "an imitation of or offered for sale under the name of another article," or in case of substitution of contents or of failure to disclose the quantity or proportion of certain specified ingredients, if present, such as alcohol, morphine, opium, cocaine, etc.

It is a matter of common knowledge that the "substances" or "mixtures of substances" which are embraced in the act, although not recognized by the United States Pharmacopoeia or National Formulary, are sold under trade names without any disclosure of constituents, save to the extent necessary to meet the specific requirements of the statute. Are the provisions of the section to which we have referred, introduced by the word "also," and the one relating to the place of manufacture, the only provisions as to descriptive statements which are intended to apply to these medicinal preparations? Was it supposed that with respect to this large class of compositions, nothing being said as to the ingredients except as specifically required, there could be, within the meaning of the act, no false or misleading statement in any particular? If false and misleading statements regarding such articles were put upon their labels, was it not the intent of congress to reach them? And was it not for this very purpose that the general language of section 8 was used?

The legislative history of the section would seem to negative the contention that congress intended to limit the provision to statements as to identity. The provision in question as to misbranding, as it stood in the original bill in the senate (then section 9), was as follows:

"If the package containing it, or its label, shall bear any statement regarding the ingredients or the substances contained therein, which statement shall be false or misleading in any particular."

The question arose upon this language whether or not it should be taken as limited strictly to statements with respect to identity. It was insisted that the words had a broader range and the effort was made to produce an amendment which should be so specific as to afford no basis for the conclusion that anything but false statements as to identity or constituents was intended. An amendment was then adopted in the senate making the provision read: "any statement as to the constituent ingredients, or the substances contained therein, which statement shall be false or misleading in any particular."

With this amendment the bill was passed by the senate and went to the house. There the provision was changed by striking out the word "constituent" and inserting the word "regarding," so that it should read: "any statement regarding the ingredients or substances contained in such article, which statement shall be false or misleading in any particular."

Finally, it appears, that in conference the bill was amended by inserting the words "design, or device," and also the words "such article, or"; and thus the section became a part of the law in its present form—containing the words: "any statement, design or device regarding such article, or the ingredients or substances contained therein which shall be false or misleading in any particular."

It is difficult to suppose that, with the question distinctly raised, congress would have rejected the provision of the senate bill and broadened the language in the manner stated if it had been intended to confine the prohibition to false statements as to identity. Reading the act with the sole purpose of giving effect to the intent of congress, I cannot escape the conclusion that it was designed to cover false and misleading statements of fact on the packages or labels of articles intended for curative purposes, although the statements relate to curative properties.

It is, of course, true, that when congress used the words "false or misleading statement" it referred to a well-defined category in the law and must be taken to have intended statements of fact and not mere expressions of opinion.

The argument is that the curative properties of articles purveyed as medicinal preparations are matters of opinion, and the contrariety of views among medical practitioners, and the conflict between the schools of medicines are impressively described. But, granting the wide domain of opinion, and allowing the broadest range to the conflict of medical views there still remains a field in which statements as to curative properties are downright falsehoods and in no sense expressions of judgment. This field I believe this statute covers.

The construction which the district court has placed upon this statute is that it cannot be extended to any case where the substance labeled as a cure, with a description of curative properties, is "wholly worthless" and is known by the defendant to be such. That is the charge of the indictment.

The question, then, is whether, if an article is shipped in interstate commerce, bearing on its label a representation that it is a cure for a given disease, when on a showing of the facts there would be a unanimous agreement that it was absolutely worthless and an out-and-out cheat, the act of congress can be said to apply to it. To my mind the answer appears clear. One or two hypothetical illustrations have been given above. Others may readily be suggested. The records of actual prosecutions, to which I am about to refer, shows the operation the statute has had and I know of no reason why this should be denied to it in the future.

Our attention has been called to the construction which was immediately placed upon the enactment by the officers charged with its enforcement in the department of justice and the department of agriculture. It is true that the statute is a recent one, and, of course, the question is one for judicial decision. But it is not amiss to note that the natural meaning of the words used in the statute, reflected in the refusal of congress to adopt a narrower provision, was the meaning promptly attributed to it in the proceedings that were taken to enforce the law. And this appears to have been acquiesced in by the defendants in many prosecutions in which the defendants pleaded guilty. We have been referred to the records of the department of agriculture showing nearly thirty cases in which either goods had been seized and no defense made or pleas of guilty had been entered. Among these are found such cases as the following:

"No. 29. Hancock's Liquid Sulphur, falsely represented, among other things, to be 'Nature's Greatest Germicide.' * * * The Great Cure for * * * Diphtheria." Investigation begun November 22d, 1907. Plea of guilty.

"No. 180. Gowan's Pneumonia Cure, falsely represented, among other things, that it 'Supplies an easily absorbed food for the lungs that quickly effects a permanent cure.' Investigation begun November 22d, 1907. Criminal information. Plea of guilty."

"No. 181. 'Evelin,' falsely represented, among other things, that it 'Repairs and Rejuvenates the Eye and Sight.' Investigation begun February 13th, 1908. Plea of guilty."

"No. 261. 'Sure Thing Tonic,' falsely represented, among other things, to be 'Sure Thing Tonic.' * * * Restores Nerve Energy. Renew's Vital Force.' Investigation begun July 3d, 1909. Pleaded guilty."

"No. 424. 'Tuckahoe Lithia Water,' falsely represented, among other things, to be 'a sure solvent for calculi, either of the kidneys or liver, especially indicated in all diseases due to uric diathesis, such as gout, rheumatism, gravel stone, incipient diabetes, Bright's disease, inflamed bladder, eczema, stomach, nervous and malarial disorder.' Investigation begun July 9th, 1908. Plea of guilty."

"No. 427. 'Cancerine,' falsely represented, among other things to be 'A remarkable curative extract which, if faithfully adhered to, will entirely eradicate cancerous poison from the system.' * * * A specific cure for cancer in all its forms.' Investigation begun about April 12th, 1909. Criminal information. Plea of guilty."

I find nothing in the language of the statute which requires the conclusion that these persons who have confessed their guilt in making false and misleading statements on their labels should be privileged to conduct their interstate traffic in their so-called medicines, admittedly worthless, because congress did not intend to reach them.

Nor does it seem to me that any serious question arises in this case as to the powers of congress. I take it to be conceded that misbranding may cover statements as to strength, quality and purity. But so long as the statement is not as to matter of opinion, but consists of a false representation of fact—in labeling the article as a cure when it is nothing of the sort from any point of view, but wholly worthless—there would appear to be no basis for a constitutional distinction. It is none the less descriptive—and falsely descriptive—of the article. Why should not worthless stuff, purveyed under false labels as cures, be made contraband of interstate commerce, as well as lottery tickets? Champion vs. Ames, 138 U. S. 331.

I entirely agree that in any case brought under the act for misbranding—by false or misleading statement as to curative properties of an article—it would be the duty of the court to direct an acquittal when it appeared that the statement concerned a matter of opinion. Conviction would stand only where it had been shown that, apart from any question of opinion, the so-called remedy was absolutely worthless and hence the label demonstrably false; but in such case it seems to me to be fully authorized by the statute.

Accordingly I reach the conclusion that the court below erred in the construction that it gave the statute, and hence in quashing the indictment, and that the judgment should be reversed.

President Taft on the Nostrum Evil.

President Taft, while absent from Washington attending the Yale commencement exercises, sent the following emergency message to congress regarding the necessity for a more far-reaching food and drugs act:

To the Senate and House of Representatives:

Your attention is respectfully called to the necessity of passing at this session an amendment to the food and drugs act of June 30th, 1906, which will supplement existing law and prevent the shipment in interstate and foreign commerce and the manufacture and sale within the territories and the District of Columbia of worthless nostrums labeled with misstatements of fact as to their physiological action—misstatements false and misleading even in the knowledge of those who make them.

On June 30th, 1906, after an agitation of twenty years, the food and drugs act, passed by the fifty-ninth congress, received the approval of the president and became law. The purpose of the measure was two-fold, first, to prevent the adulteration of foods and drugs within the jurisdiction of the federal government, and, second, to prevent any false labeling of foods and drugs that will deceive the people into the belief that they are securing other than that for which they ask and which they have the right to get.

The law was received with general satisfaction and has been vigorously enforced. More than 2,000 cases have been prepared for criminal prosecution against the shippers of adulterated or misbranded foods and drugs, and seizures have been made of more than 700 shipments of such articles. More than two-thirds of these cases have been begun since March 4th, 1909. Of the criminal cases more than 800 have terminated favorably to the government, and of the shipments seized more than 450 have been condemned and either relabeled or destroyed. In every case in which the food seized was deleterious to health, it was destroyed. A large number of cases are now pending.

The supreme court has held in a recent decision (United States versus O. A. Johnson, opinion May 29th, 1911) that the food and drugs act does not cover the knowingly false label-

ing of nostrums as to curative effect or physiological action, and that inquiry under this salutary statute does not by its terms extend in any case to the inefficiency of medicines to work the cures claimed for them on the labels. It follows that, without fear of punishment under the law, unscrupulous persons, knowing the medicines to have no curative or remedial value for the diseases for which they indicate them, may ship in interstate commerce medicines composed of substances possessing any slight physiological action and labeled as cures for diseases which, in the present state of science, are recognized as incurable.

An evil which menaces the general health of the people strikes at the life of the nation. In my opinion, the sale of dangerously adulterated drugs, or the sale of drugs under knowingly false claims as to their effect in disease, constitutes such an evil and warrants me in calling the matter to the attention of the congress.

Fraudulent misrepresentations of the curative value of nostrums not only operate to defraud purchasers but are a distinct menace to the public health. There are none so credulous as sufferers from disease. The need is urgent for legislation which will prevent the raising of false hopes of speedy cures of serious ailments by misstatements of fact as to worthless mixtures on which the sick will rely while their diseases progress unchecked.

At the time the food and drugs act was passed there were current in commerce literally thousands of dangerous frauds labeled as cures for every case of epilepsy, consumption, and all lung diseases, cures for all kidney, liver, and malarial troubles, cures for diabetes, cures for tumor and cancer, cures for all forms of heart disease; in fact, cures for all the ills known at the present day.

The labels of many of these so-called cures indicated their use for diseases of children. They were not only utterly useless in the treatment of the disease, but in many cases were positively injurious. If a tithe of these statements had been true, no one with access to the remedies which bore them need have died from any cause other than accident or old age.

Unfortunately, the statements were not true. The shameful fact is that those who deal in such preparations know they are deceiving credulous and ignorant unfortunates who suffer from some of the greatest ills to which the flesh of this day is subject. No physician of standing in his profession, no matter to what school of medicine he may belong, entertains the slightest idea that any of these preparations will work the wonders promised on the labels.

Prior to the recent decision of the supreme court, the officers charged with the enforcement of the law regarded false and misleading statements concerning the curative value of nostrums as misbranding, and there was a general acquiescence in this view by the proprietors of the nostrums. Many pretended cures, in consequence, were withdrawn from the market, and the proprietors of many other alleged cures eliminated false and extravagant claims from their labels, either voluntarily or under the compulsion of criminal prosecution. Nearly one hundred criminal prosecutions on this charge were concluded in the federal courts by pleas of guilty and the imposition of fines. More than 150 cases of the same nature, involving some of the rankest frauds by which the American people were ever deceived are pending now, and must be dismissed.

I fear if no remedial legislation be granted at this session that the good which has already been accomplished in regard to these nostrums will be undone, and the people of the country will be deprived of a powerful safeguard against dangerous fraud. Of course, as pointed out by the supreme court, any attempt to legislate against mere expressions of opinion would be abortive; nevertheless, if knowingly false misstatements of fact as to the effect of the preparations be provided against, the greater part of the evil will be subject to control.

The statute can be easily amended to include the evil I have described. I recommend that this be done at once as a matter of emergency.

WILLIAM H. TAFT.

Positions Open in the Federal Service.

The United States civil service commission announces that the Philippine government desires to fill two vacancies in the position of chemist, division of organic chemistry, bureau of science, Manila, P. I., at salaries of \$2,000 each per annum, and vacancies requiring similar qualifications as they may occur, unless it shall be decided in the interest of the service to fill such vacancies by reinstatement, transfer, or promotion.

It is desired to secure the services of two young men between twenty and forty years of age with a high grade of scientific training who are capable of original work. A thorough training in general and organic chemistry at a reputable college or university and experience in organic research is a prerequisite for consideration for this position; a Ph. D. degree from a leading university would be preferable.

Applicants should at once apply for application and examination Form B. I. A. 2 either to the United States civil service commission, Washington, D. C., or to the secretary of the board of examiners as follows: Post office, Boston, Mass., Philadelphia, Pa., Atlanta, Ga., Cincinnati, Ohio, Chicago, Ill., St. Paul, Minn., Seattle, Wash., San Francisco, Cal., San Juan, P. R.; customhouse, New York, N. Y., New Orleans, La., Honolulu, Hawaii; old customhouse, St. Louis, Mo. No application will be accepted unless properly executed and filed with the commission at

Washington in complete form, with the material required, prior to the hour of closing business on August 1st, 1911.

The commission also announces examinations for candidates to fill positions as medico-chemical analyst and as food technologist. Men only will be admitted to these examinations. The time for filing applications for the first named position expires July 22d, and for the second, July 29th.

Philadelphia Association of Retail Druggists.

Reports which showed that the Sunday closing movement was making steady progress among the pharmacists of Philadelphia were among those submitted at the regular meeting of the Philadelphia Association of Retail Druggists held June 2d. M. D. Allen, a member of the executive committee from the eleventh district, announced that as the results of his interviewing a number of proprietors in his neighborhood, the majority of them had closed for a few hours on Memorial Day, and there was every indication of an increased number closing for a portion of Sunday. William E. Lee of the eighth district announced that there was only one man in his neighborhood that did not close from 1 to 6 p. m. on Sunday. He advocated every one in favor of the move, taking the initiative and closing, thereby setting a good example which, it had been shown, the majority would follow.

Another interesting report was made by Chairman A. G. Keller, of the special committee on advertising. He announced that already two strong articles had been inserted in the Sunday newspapers, showing why the public should patronize the retail drug stores in the respective neighborhoods and mentioning a few of the lines in which the service afforded at the drug store was the most reliable and indispensable. It was shown that this campaign of "booming" the drug store had already brought in new members and that it was being commented upon most favorably by both members and non-members. Still more comprehensive plans were broached by Mr. Keller.

Representative J. H. Barlow in his report brought up the recent prosecutions of small dealers in the southern section of the city who were charged with selling soda water that had been adulterated, and he advised the members of the P. A. R. D. to make sure that their skirts were absolutely clear in this respect. He submitted a copy of the Pennsylvania laws on this subject. As there was some difference of opinion as to the requirements of the law, it was decided to invite Special Agent H. P. Cassidy of the Pennsylvania Pure Food and Dairy Commission to the July meeting of the association to address the members on this subject.

Mr. Barlow also called attention to a movement on the part of the postal employees to have druggists refrain from selling stamps on Sunday with a view to eliminating work on that day for letter carriers and clerks. A letter to that effect was read from an organization of letter carriers, but it was laid on the table for thirty days. The prevailing sentiment seemed to be that the druggist would be criticised by his patrons if he should, for instance, sell them post cards on Sunday and then refuse to sell the accompanying stamps, and that it would be unwise for him to inaugurate such a move. In this connection, it was reported that it was likely that the salaries paid to proprietors of sub-stations would shortly be reduced and considerable indignation was expressed by some of the members.

A proposition to elect delegates to the N. A. R. D. conventions by districts instead of at large as is now the method was withdrawn, as it seemed to be the sentiment that interest was lacking in some of the districts, and that many of the men who were best versed in the work of the P. A. R. D. would not be elected. A change in the by-laws, relative to the number of delegates to be elected at the July meeting, was adopted. Several applicants for membership were elected and a proposition to have the association become interested in a trading stamp proposition was frowned upon as being inimical to the best interests of the individual members.

On June 23d Representative Barchfield introduced a bill in congress providing that pharmacists in the navy shall, as other warrant officers are commissioned, be commissioned chief pharmacists, and on promotion have rank, pay and allowances of chief boatswains.

William T. Hunter has opened a new store at Fall River, Mass. He calls it the Cascade Pharmacy.

DRUG STORE ADVERTISING

By M. P. GOULD, of New York

In this department some of the fundamentals of successful drug store advertising will be expounded each month. The aim is to correct errors of advertising and establish the most profitable and advisable methods of building up retail drug trade by means of the powerful influence of advertising.

The Trend of Business To-Day.

It was a matter of general news interest when one of the leading bankers of the United States, who before that had made a notable success in another line of endeavor, and after having amassed a fortune in the banking business variously estimated at from six to ten million dollars, resigned from the banking firm with which he was connected for the avowed purpose of promoting the spirit and practice of co-operation between employer and employee.

The old order of things was for the employer to pay as little as possible and sometimes to be as disagreeable as possible to his employees with the natural and logical result that the employees would be as antagonistic as they could be without losing their jobs. The result of this order of things was that the employee would give as little service as he could, while the manufacturer retaliated by giving as little wages as he had to.

Then along came some broad-minded men who won the confidence of both employer and employee. They said to the employee, for example, "Under the present system you are carrying twelve tons of pig iron a day. If you will now begin to carry pig iron exactly as we tell you to you will not work any harder than you are now working and we will pay you more wages than you are now getting." The result was that the same man could carry forty-seven tons of pig iron a day and not work as hard as he did before and could make more than double the wages that he formerly made. In another case, an apprentice, within a week after he went to work, under the new system could lay more brick than the oldest and most experienced workman had ever laid for the contractor.

Nothing could persuade men to do that extra work except belief that the people in charge were co-operating with them to produce a better day's work without requiring any more irksome effort.

The extreme high cost of living helped to bring this new order on. The magazines are full of descriptions of it; editorials on it are being written in countless number; correspondents of newspapers are talking about it; speakers at banquets and associations are discussing the question.

Let us see if there is not something of use in this proposition for the retail druggist.

Let us speak in a frank, manly and straightforward and wholly friendly way.

There is, as everybody knows, a great deal of feeling between many clerks and many druggists. Many clerks say that their employer does not pay them sufficient wages so that they can do an honest day's work. Many employers say that drug clerks are lazy, that they steal and that they are "drug fiends" and that they will shirk work whenever they get a chance.

The facts are that druggists are way above the average as employers among retailers; also, that drug clerks are way above the average as retail employees.

Whenever the druggist has taken his clerks aside and had a frank talk with them and given them a co-operative interest in his business, his business has shown such a marked increase, not only in sales but in the satisfactory

treatment which customers receive that he has been glad of his action. There are several different ways of making clerks feel that they are a co-operative part of the business.

One way, which is being followed by quite a few druggists in different sections of the country, is to incorporate and either give or let the clerks buy on a long-time basis, a share in the company itself.

Another way is to pay the clerks a proportionate percentage of the total sales of the business.

A third way is to pay the clerks a percentage of the net profits of the business.

This movement for co-operation is extending past the mere question of relations between clerks and employers.

The druggist is going to the doctor and entering into a more friendly and a more co-operative spirit of work with him. The druggist is also entering into more friendly relations of co-operation with the manufacturer. This is true of all lines of retail trade. When the manufacturer was downing the retailer as a "back-biter" and a general scamp the retailer naturally retaliated by "knocking" the manufacturer's goods every time he got a chance.

The government investigations are bringing out the fact that competition, as it develops in modern business, is not the "life" of trade, but is the "death" of trade. Consequently, the movement to-day is for competitors to co-operate in order that they may produce a better condition in every line of business.

We have already seen this condition arise among retailers where they all get together in a town to eliminate cut prices, or when they agree with department stores upon general methods of doing business.

Manufacturers, who are met half way by retailers, are very amenable to working with the retailer, using their influence to send trade to the retailer and forming a working arrangement with the retailer whereby the manufacturer's goods will get a better show and the retailer himself will get a better profit and a better deal with the manufacturer.

Carrying this question a step further, the spirit of co-operation extends to a retailer's dealings with his customers. Suppose a retailer acts towards his customers in a way which seems to say: "I am selling you these goods

The value of pure drugs and the necessary experience in compounding.

The value of medicine lies equally between the purity and power of the drugs and the method and manner of their compounding. The drugs we offer are strictly of the highest class. Our training, experience and equipment assure that all medicines will be compounded right.

Bring all your prescriptions here to be filled.

(Name and address)

to-day at this price because I want you to buy what goods you need next week of me also. I am waiting on you in this congenial, friendly manner because I want you to feel friendly toward this store. I am sending my boy out to your house to get your prescription and then sending the medicine to your house without extra charge because I want to be so accommodating that you will trade with me and use your influence in bringing other people among your friends to trade with me. I am using my best and fairest judgment to always give you what you want and never sell you something which you will regret buying, because I want you to have confidence in me and my clerks. In other words, I want to co-operate with you

Mosquitos

You can't dodge 'em—make them dodge you. Perfumed fumigators, pastilles and powders; also lotions to relieve the bites, or oils to prevent skeeters biting. Something here you want these hot nights.

(Name and address)

you need, and that I, to the best of my ability, will give you trustworthy advice." Suppose such a spirit should pervade a drug store for even one month, would not the customers begin to feel it? Would not there spring up between the dealer and his customers a spirit of co-operation, of working together, a spirit of friendly dealing, which would be to the advantage of both the customer and the dealer?

The papers are full of talk about international peace and good will. The spirit of friendliness and neighborliness is pervading the whole world. Nations want to be friendly with each other. Manufacturers want to be friendly with each other. Retailers want to be friendly with each other. The manufacturers want to be friendly with the retailers, retailers want to be friendly with manufacturers. Customers want to be friendly with retailers and retailers want to be friendly with customers. When this spirit ripens to its full fruition, then we will have a finer business, a more profitable business, a more satisfactory business for everybody—for the employee—for the employer—for the customer.

This is not Utopian. This is not a dream. This is not mere foolish theory. The world is moving rapidly. A few years ago the "peace advocates" were thought to be harmless fanatics. Now the man who does not believe in international peace is considered queer. A few years ago there was a great deal said about class hatred. There is a great deal of class hatred left, but there is not so much as there was. There has been a great deal said about capital and labor. There is a better spirit toward labor to-day among capitalists than there ever was before.

In England there are co-operative societies which handle hundreds of millions of dollars worth of goods every year, that furnish supplies to millions of families; they are having an enormous effect upon trade and upon prices. Advocates of the same system are at work in this country with the hope of establishing such societies here. No doubt, in a small way, there are some already established.

The head of the steel trust says that the time is surely coming, if not already here, when the government must regulate the prices of great commodities.

As the United States matures there undoubtedly will not be the possibilities of getting rich quick, of making fortunes out of a shoe string, the same as there has been in the past. There will be a kindlier spirit toward labor. Labor will be recognized and given a co-operative interest in the companies where it is employed.

Capital, that is employers, will not expect to make such a large profit; the government insists that the great corporations shall make only a fair return from the money invested. Some great corporations are reducing their charges to the public because they figure that when they have earned a certain percentage like eight or nine per cent. on their total capital that is as much as they should earn. Indeed, some of the great corporations in manufacturing seem to feel that they have had a good year if they earn six or seven per cent. on their capital.

Why is this question being discussed in this department?

First, because it is a live question which every retailer ought to be interested in; second, because it represents a business policy which the far-sighted, progressive retailer should consider carefully. It is the man who looks far ahead and considers policies who is prepared to take advantage of the things which make for progress and profit in the future.

The retailer who organizes his business upon a basis

in giving you the best drug services that can be had in this town. I want you to know that my prices are as low as should be reasonably charged for the goods, and, in turn, I want you to feel that you can come to me and ask me frankly about any drug which

whereby the work is done by loyal, enthusiastic employees is far ahead of the retailer whose employees hate him and who work indifferently or antagonistically to his interests.

The retailer who, in one way or another, gets his employees to feeling that they have a co-operative interest in the success of his affairs has made a big step in advance. Then, if that same retailer gets his customers to feeling that they have an active interest in his business he has made a still greater advance. Also, if that retailer can work with manufacturers so that they have a distinct interest in using their influence in his behalf he has made still greater progress. If he can use his advertising to work out this spirit of co-operation, this feeling of good will toward all and can permeate his advertising with that spirit, then his advertising will be remarkably successful.

Beauty Behind the Counter.*

Coming over from New York the other day I bought a New York paper and looked over the want ads. There's sure a heap of fun hearing people tell what they want. And maybe they don't want a lot!

Here's an ad. I ran across and cut out:

WANTED.—By high-grade confectionery, ice cream and bakery, two young ladies to wait on trade. Must be of handsome appearance. No experience necessary if other requirements are satisfied. Address X 2, Herald.

In other words, what's wanted was a couple of peaches who could travel on their looks; made no difference whether they knew their business or not.

Gee whiz, what a fearful mistake you're making Mr. X 2! Take it from me, what you're looking for, if you want clerks you can depend on, are girls that are clean, but homely. Peaches "of handsome appearance" may be good to look at; but put 'em to work and they rot out in five minutes.

I've talked with thousands of candy men on the clerk question, and I've never found one that didn't agree with me. You can

say what you please—when you want real work done, the real pretty clerk is about as good to have around as a new baby. The fellow that hires 'em (and the fellow that marries 'em, while I'm on the subject), has something that looks like a peach but tastes like a lemon.

You can't expect many of the girls you hire as clerks to take a very deep interest in the business, but you can expect 'em to take some. I never knew one of these pretty things to take any interest in anything except puffs and their steadies. Of course there are exceptions to everything.

One of the

Taking Pictures

SNAP! and the picture's taken. A good camera—inexpensive but of reliable make—takes pictures easily, and you can do the work.

Nature at her best invites you to record her beauties. You want pictures. We'll sell you a camera and all supplies; pay as much or as little as you wish.

(Name and address)

* From the Southern Pharmaceutical Journal.

prettiest fairies I ever saw in my life, a candy man in Williamsport, Pa. hired as clerk about a year ago. She was sure a queen.

"By gravy, old man!" I said to him the first time I saw her, "Where did you get her? She's the richest thing I've seen since the war!"

"Ain't she all right?" he said in great delight. "Won't she draw trade, eh?"

"Well, she may draw it," I said, "but the chance is the homely ones will have to wait on it. That is if you want to keep it. I don't take much stock in these beauties."

I saw that girl several times after that and after awhile I got so I talked to her. One day while I was waiting for the boss and trade was dull, I hit up a talk with her to see how much she knew about the business.

When we had this talk she had been there six months. Anybody with a spoonful of brains and any interest at all, could learn something in that time, couldn't they? Well, she hadn't learned anything. She knew that the chocolates in this case were 40 cents a pound, and the candied fruit was 80, but outside of things like that, that she simply had to know, she didn't know a blamed thing and didn't want to.

To see if she had any ideas at all, I asked her how many candy stores there were in Williamsport.

"I don't exactly know. Quite a number."

Mind you, she'd lived there all her life.

"Which is the best section of the town for this business?"

"I don't know as I could say. I guess one's about as good as another."

"Is there a good trade for high-class goods in the town?"

"Oh, I don't know." (Yawn in my face.)

And she didn't know. She didn't know a darned thing and she didn't care who knew it.

"How's society here?" I asked her then, "Lively?"

Maybe she didn't come to life!

"It's fine!" she said, "there are perfectly lovely balls and parties going on all the time. I was out to one last night. The very best people in the town were there and I had a lovely time. I'm going to another next Tuesday night that will be fine, too. I belong to ——" And more of the same. And more of the same. And more of the same.

That pretty little creature simply sold so much of her time a day. She didn't sell an atom of her interest, and she didn't give any of it away.

Flavoring Extract Manufacturers' Association.

The second annual meeting of the Flavoring Extract Manufacturers' Association of the United States was held at Chicago June 8th and 9th, President W. M. McCormick in the chair.

Among the resolutions passed were the following: That the association express its commendation of the work of the National Civic Federation in establishing throughout the various States the committee on uniform laws whose efforts are directed to the attainment of uniformity of legislation as to bills of lading, warehouse receipts and negotiable instruments; that the association especially endorses, and that it will lend every effort to secure in the various States uniform legislation as to pure food and drug laws, which State legislation shall be in conformity to present national pure food and drugs laws; that every effort be made to have flavoring extracts included in the tariff schedule which provides for a rebate on alcohol used in perfumery and kindred preparations, and also include alcohol used in the arts and sciences; that the association place itself on record as strongly favoring a definite standard for vanilla.

Mr. McCormick was re-elected president; the remaining officers chosen being, first vice-president, John L. Clawson, of Philadelphia; second vice-president, A. E. Claus, of Brooklyn; third vice-president, S. J. Sherer, of Chicago; treasurer, Robert E. Heckin, of Cincinnati; secretary, Dr. S. H. Baer, of St. Louis. Executive committee—C. E. Foote, of Jackson, Mich.; Norman Peck, of Indianapolis; and Frank L. Beggs, of Newark, O.

The next meeting will be held at Baltimore.

"Man's a funny proposition," soliloquizes the Boston Transcript; "when he reads a medical book, he fancies he has every disease described; but let him read the work of a moralist and all the faults pointed out he sees not in himself, but in his neighbor."

PRACTICAL FOUNTAIN HELPS.

Picayune Profit and Plutocratic Proceeds.

"Oh, the soda fountain attracts a picayune sort of trade," said the man who believes in dignified pharmacy and a genteel passing out of 25-cent soap and \$1.50 hair brushes.

So it does, in a sense, but that is not the way the soda-water druggist figures it. He says: In a family of five people—father, mother and three children—of ordinary means, maybe not more than a couple of hair brushes are bought in a year, and three or four cakes of soap will last a month or so. Maybe a whole year will go by without a case of sickness in the family serious enough to require the attention of a physician and the filling of a prescription. Of course there will be a little witchhazel water, "magnesia," toothache drops, cold cream and the like to be bought every now and then, all of which counts and goes to swell the monthly receipts of the store. On the other hand, really A1 soda water and sundaes, with hot chocolates, bouillons and the like in cold weather, appeal to the whole family every day in the year, and if a fountain and service are made attractive, the appeal will result in a sale once or twice in a day to nearly every one of its members—say, for short, will bring in receipts of 33 1/3 cents a day on an average all the year 'round. This means a profit of, perhaps, 20 cents a day for 365 days, amounting to \$73. Not only this, but the family will also buy its drugs, toilet articles, etc., from the store to which it goes for its soda, and the fact that its various members have a habit of dropping in once or twice a day results in the sale of a good many things which would not have been thought of otherwise.

This argument may sound somewhat Col. Sellersque to many, yet some who have "got them coming" to their fountains may object to the figures on account of their over-conservatism.

Does soda water pay?

Well, it all depends—. Does running a street railway system pay?

As Soda Water Is Served at Danville, Va.

W. M. Brydon, manager of the West End Pharmacy, Danville, Va., was asked by a CIRCULAR representative, "Do you think making a specialty of your fountain business has helped or hindered your general drug business?" "Most decidedly it has helped," he replied, "a great many of our customers who began as soda-water patrons have become good and permanent patrons of the prescription department. In fact, it works both ways—a person waiting for a prescription will almost invariably order a drink, especially if the fountain looks attractive."

AN UP-TO-DATE FOUNTAIN ITS OWN BEST ADVERTISEMENT.

"Being in the residential district," continued Mr. Brydon, "we consider the fountain and fixtures themselves our best advertisement. Everything connected with our soda-water department is the best, from the fountain down. And we have not been disappointed in the appeal it makes to the trade. And in the drinks served we follow the same policy, paying more attention to quality than variety. No fountain can be conducted successfully in a residential district without ice cream—good ice cream is the product most in demand, and seemingly hardest to get; so we have installed an electric plant in the basement and make our own supplies of this delectable confection, using only fresh, pure cream in the process. We never serve an ice cream with canned or preserved fruit—if we can't get fresh fruit we don't serve fruit cream at all, but suggest something that may be made of the plain cream, as a nut taffy or a sundae, as a substitute."

DIRTY MENU CARDS.

Mr. Brydon mentioned one point only in regard to cleanliness: he said that often druggists who are scrupulously clean about everything else will be careless about their menu cards; that nothing is more offensive to a customer than a fly-specked or otherwise soiled card from which to make her order; and that unless the supply of cards is large enough to justify the immediate retirement of such of them as may become in the least thumb-soiled, it is very much better to dispense with that feature altogether.

Mr. Brydon's idea is that, in the end, nothing pays but the best.

Fresh Fruit Confections.

During the summer when fresh fruits of all kinds are easily obtainable, beverages and sundaes in which these aids play an important role are much to the fore. Some suggestions apropos follow:

You Know.

Crushed strawberries, 1 tablespoonful; crushed raspberries, 1 teaspoonful; crushed pineapple, 1 teaspoonful; grape-juice syrup, 1½ ounces; vanilla extract, a small dash; milk, 1 ounce; ice-cream, 1 tablespoonful; crushed ice, enough. Shake well and fill the glass, using the fine stream. Serve with a spoon.

Orchard Sundae.

Mix in a bowl equal parts of crushed cherries, crushed peaches, and crushed blackberries, and dilute to a proper consistence with grape juice. A ladleful of this is to be poured over a portion of vanilla ice cream, and the whole topped with whipped cream and a cherry or berry.

Variety Sundae.

On a rather large, flat sundae dish place a portion of vanilla ice cream, making with the spoon as many depressions in the same as there are crushed fruits to be served with it. In each depression pour a small ladleful of crushed fruit, a different kind in each. Garnish with whole fruit, and be sure to charge enough to pay for the confection and the time consumed in preparing it.

Peach Melba.

In a sherbet glass place a ladleful of sliced peaches; add a portion of vanilla ice cream and cover the top with sweetened whipped cream. On one side of the dish place a spoonful of chopped nuts, and cap the whole with a berry or cherry.

Raspberry Juice.

Select raspberries, 1 quart; sugar, 12 ounces; water, 3 pints; juice of 1 lemon; juice of 1 orange. Mix and stir until the berries have yielded up their juice, and the sugar is dissolved, then strain through muslin. Serve "straight," with cracked ice.

Summer Delight.

Vanilla syrup, 1 ounce; crushed strawberries, a ladleful; shave ice, to fill a mineral-water glass. Top with whipped cream.

Peach-and-Cream Soda.

Mix in a bowl, peach syrup, 2 ounces; orange syrup, 6 ounces; vanilla syrup, 9 ounces; ripe peaches, but fine, 8 ounces; cream 24 ounces. Put a small ladleful of this in a glass and draw the soda in the usual way.

Fruit Smash.

Juice of ½ orange; juice of ½ lemon; pineapple juice, ½ ounce; powdered sugar, 2 tablespoonfuls; crushed ice, enough. Fill the glass with carbonated water, and stir well.

What Chocolate and Cocoa Are.

Food inspection decision 136 recently issued by the department of agriculture, Washington, defines the meaning of certain names applied to chocolates and cocoas—the word "cocoa" being the one used by the department where druggists sometimes use "cacao." According to this decision, the names "chocolate," "plain chocolate," "bitter chocolate," "chocolate liquor," and "bitter chocolate coatings," are applied to the solid or plastic mass obtained by grinding cocoa nibs without the removal of fat or other constituents except the germ, containing not more than 3 per cent. of ash insoluble in water, 3.5 per cent. of crude fiber, and 9 per cent. of starch, and not less than 45 per cent. of cocoa fat.

"Sweet chocolate" and "sweet chocolate coatings" are terms applied to chocolate mixed with sugar (sucrose), with or without the addition of cocoa butter, spices, or other flavoring materials, and contain in the sugar and fat-free residue no higher percentage of either ash, fiber, or starch than is found in the sugar and fat-free residue of chocolate.

Cocoa, and powdered cocoa, are terms applied to cocoa nibs, with or without the germ, deprived of a portion of their fat and finely pulverized, and contain percentages of ash, crude fiber, and starch corresponding to those in chocolate after correction for fat removed.

Sweet cocoa, and sweetened cocoa, are terms applied to cocoa mixed with sugar (sucrose), and contain not more

than 60 per cent. of sugar (sucrose), and in the sugar and fat-free residue no higher percentage of either ash, crude fiber, or starch than is found in the sugar and fat-free residue of chocolate.

Cocoa nibs, and cracked cocoa, are the roasted broken seeds of the cacao tree freed from shell or husk.

Milk chocolate and milk cocoa should contain not less than 12 per cent. of milk solids, and the so-called nut chocolates should contain substantial quantities of nuts. If sugar is added, for example, to milk chocolate, it should be labeled "sweet milk chocolate," "sweet nut chocolate," etc.

When cocoa is treated with an alkali or an alkaline salt, as in the so-called Dutch process, and the finished cocoa contains increased mineral matter as the result of this treatment, but no alkali as such is present, the label should bear a statement to the effect that the cocoa contains added mineral ingredients, stating the amount. Cocoas and chocolates containing an appreciable amount of free alkali are adulterated. Cocoa not treated with alkali is held to be not soluble in the ordinary acceptance of the term. Cocoa before and after treatment with alkali shows essentially the same lack of solubility. To designate the alkali-treated cocoa as "soluble" cocoa is misleading and deceptive.

Food-and-Drug Stores.*

Seemingly the progenitors of the food and drugs act knew what they were about in harnessing up those two lines of merchandise together. If you don't believe it, look at the lunch counter of city drug stores. (Perhaps in the course of a few years we shall be accustomed to speaking of them as "Food and Drug Stores.") Just the same, we are not shedding any tears over that part of it. It shows that druggists are about as quick on their feet as the best of 'em in the commercial arena. Just as the sad-visaged prophets of disaster and calamity are ready to announce that the druggist has at last been counted out, he comes back with a smile and a new side line and goes at it harder than ever.

We might all of us prefer that these ham-and-egg prescriptions be omitted, but the first thing is to make a living. You may call this the doctrine of an opportunist. Then be it so. A good live, well-fed opportunist is happier than a dozen hungry martyrs any day.

The Wonderful Bettes Store and Its Fountain.

One of the best appointed drug stores in the country is the Bettes Pharmacy, Jacksonville, Fla. Charles C. Bettes, who is still on the sunny side of fifty, rose from a clerkship in the store of Dr. H. Robinson, until he became the head of one of the largest retail drug corporations in the South.

The thorough treatment given to every part of the business of this concern shows immediate results in the soda department. It is a rule of this store that every utensil used about the fountain, including syrup containers, must be thoroughly washed and sterilized each day.

When Mr. Bettes put in expensive fixtures some years ago, the wisacres shook their heads and said he was too far ahead of the times. But he wasn't, for his business has grown to such an extent that recently he took out the fixtures which had been the talk of the city and put in better ones.

Even though his patience be stretched up to the breaking point, or his dignity ruffled almost beyond endurance, if by smiling and passing out a pleasant word or two the dispenser can send the customer away in such a good humor that he will be glad to come back, isn't it worth doing? Let the man who does the buying for the soda department reflect a moment: Does he recall how sharply he spoke to a traveling salesman the other day? And did the salesman answer him in the same tone? And if he had, would the buyer have given him an order? Or a welcome the next time he called? We are all human—buyers and sellers, soda customers and dispensers, and a soft answer turneth away wrath now as much as it ever did.

It is bad policy to insist upon giving the customer more soda than the glass will hold, as he does not lick the holder anyway, and more people are offended by sloppiness at the fountain than always speak of it.

* From the New Idea.

The Approaching A. Ph. A. Meeting.

For its fifty-ninth annual meeting the American Pharmaceutical Association will go to Boston, a city rich in historical interest and long the recognized home of American letters. Some of the most stirring events of the war for American independence took place at or near Boston, and there lived and labored such men as Longfellow, Whittier, Emerson, Hawthorne, Lowell, and a dozen others whose names are almost as well known in literary circles; and here, over the drug store of the late Theodore Metcalf, the charming Dr. Oliver Wendell Holmes had his office and spread his geniality.

There is always a good word on tap for "Southern hospitality" and for "Western hospitality," and it is deserved; but druggists who attended the meeting of the National Association of Retail Druggists at Boston in 1905 know that there is such a thing as Eastern hospitality, too, and many of them would spell it with a big H. Probably there never had been such entertainment of a druggists' convention previous to that meeting, and if the Boston brand of hospitality has been excelled at any subsequent meeting of druggists, the news of the accomplishment did not get far from home.

The date of the approaching meeting is August 14th to 19th, inclusive, and the association's headquarters will be at the Hotel Vendome. Not only the druggists, but the business men generally of Boston, and some of her organized bodies and public officials, are going to try to make the forthcoming meeting a record-breaker—if not in size (a matter which they can not control), at least in interest and in the pleasure experienced by those in attendance. In charge of the plans and arrangements is C. H. Packard, local secretary. Associated with him for certain designated works are J. Arthur Bean, entertainment and reception; F. F. Ernst, telephones; E. O. Engstrom, pharmacy boards; E. H. La Pierre, accommodations and information; and James F. Finnerton, finance. John G. Godding, president-elect of the association, is, of course, actively at work to make the meeting all that it should be, and that the ladies in attendance will be well provided with entertainment is assured by the fact that Mrs. Godding will make them her special charge. The treasurer of the local committee is J. W. Baird.

Members of the association who do not go to Boston will "miss it"; and those who ought to be members and are not should go to Boston and join.

J. G. Godding, President-Elect of the A. Ph. A.

When John Godding, drug clerk, aged twenty-two years, joined the American Pharmaceutical Association at its meeting held at Boston in 1875, he doubtless little dreamed that when the association held its next meeting in that city it would inaugurate him as its president. But the program for the Boston meeting next month includes just this feature, Mr. Godding having already been elected to that office by the ballots of his admiring fellow members. "Thirty-six years is a long time to wait for recognition," some drug clerk may say, and he is right, provided that "recognition" is what the one who waits is striving for; but to a man who goes quietly about his business and does things thoroughly as a matter of course, getting his reward out of his sense of duty well performed, "recognition" is but an incident and comes as an awakening rather than as a realization of well-nursed hopes. Such a man is the subject of this sketch.

John Granville Godding was born at Gardiner, Me., March 28th, 1853, and so his fifty-ninth birthday will fall during his term as chief executive of the leading pharmaceutical society of America—perhaps of the world. He attended the schools of his native town, and after a time at the high school there took a special course in Latin at Boston. When only eighteen years of age he entered upon his career as a druggist by taking a clerkship in the store of Edward S. Kelley, of Boston. While there he pursued the course at the Massachusetts College of Pharmacy, and was a member of its sixth graduating class—the class of '74. He remained with Mr. Kelley until 1878, then went to Philadelphia and worked a year for H. A. Borell. The attractions of "the Hub" proving too strong for him to resist, he went back and took a position with Levi Tower, Jr., which he held until 1884, when he and Mr. Tower formed a copartnership under the firm name of J. G. Godding & Co., and opened a store at Dartmouth and Newberry streets. This corner is still his business address. After

fifteen years as a partner, Mr. Godding became sole owner of the store, but he still retains the old name, with its "& Co." In 1907 he opened a branch at Massachusetts avenue and Beacon street, which he conducts under the firm name. These two stores, while modern in equipment and under progressive management, depend for their support upon a clientele which is not attracted by gaudy trappings and catch-penny methods. They are in sections in which reside some of the most substantial of Boston's population, and in them is done in a quiet way a considerable amount of profitable business.

Mr. Godding is what is known in some circles as a "powerful jiner," but of course no such expression as that ever disturbs the atmosphere of Boston's classic "back-bay" district, in which the two Godding stores are situated. There it may be said that he manifests a decided predilection for

JOHN G. GODDING.

operating in unison with his fellow beings to secure benefactions which usually may not be expected as a reward to individual effort. Be that as it may, Mr. Godding, in addition to his long connection with the American Pharmaceutical Association, was one of the organizers of the Massachusetts association in 1882, and was the first treasurer of the Boston Association of Retail Druggists, to which office he was more than once re-elected. As a member of the Massachusetts College of Pharmacy, which he joined thirty years ago, Mr. Godding has done some of his best work for his chosen calling, having served that organization as a trustee since 1885 and as its treasurer since 1890. In the latter office he is nominally the custodian of a fund larger than that owned by any other college of pharmacy in the country, this being the Potter bequest of nearly a quarter of a million dollars, which is managed by a board of five trustees, of whom Mr. Godding is one. In the alumni association of the college Mr. Godding has also been quite active, having filled nearly every office in the society, including that of president. He is also an N. A. R. D. man and is a member of the United States Pharmacopœial Convention.

All the activities of this even-tempered, forceful man are not along pharmaceutical lines, for he is a Mason (and a Knight Templar), a member of the Boston Chamber of Commerce, the Middlesex Club (political), the National Automobile Association, and other organizations. Busy though he is, Mr. Godding finds time to read and profit by what he finds in the journals, among those for which he sub-

scribes being no less than a dozen devoted to pharmacy and two to medicine.

With all his duties and obligations, however, Mr. Godding has time for recreation and a happy home life. Mrs. Godding, who is as well known in national pharmaceutical circles as her husband, is his helpmeet in fact as well as in name. She aids him in the management of his business, and then when vacation time comes she goes with him to their lodge, built of logs, in the Maine woods at Rangeley Lakes. When at home they are in a cozy and comfortable house at Brighton, a part of the city of Boston. They have no children living.

When asked what he proposed to do as chief executive of the American Pharmaceutical Association, the president-elect was becomingly modest and declined to make any prediction, thus emphasizing his characterization of being a man of deeds rather than words. But we shall see what we shall see, and those who know him best will be the most disappointed if he does not add new laurels to his crown by the way in which he handles the new work which his friends have put upon him through no solicitation of his.

Degrees for Two Captains of Industry.

Recently two prominent figures in the drug world have been selected by universities for high distinctions. Some particulars concerning the men and the distinctions are here given:

Samuel W. Fairchild.

At the one hundred and fifty-seventh commencement exercises of Columbia University, held on June 7th, honorary degrees were conferred upon "eleven men of distinction" selected by reason of special accomplishment from the various fields of science, law, medicine, finance and religion. The subject of this sketch was one of the eleven. President Nicholas Murray Butler presented him with his diploma in the following words: "Samuel William Fairchild, sometime president of the New York College of Pharmacy, always eager in working for the interests of that useful institution and in promoting measures to safeguard the purity of food and drugs, I gladly admit you to the degree of master of science in this university."

Going back a few years, to February 4th, 1908, this same Samuel William Fairchild was one of the "five distinguished men from five different sections of the United States" to receive from the Philadelphia College of Pharmacy the highest honor in its gift, "the title of master of pharmacy, in recognition of distinguished attainments in the pursuit of the sciences connected with the profession."

The bestowal of these honors upon Mr. Fairchild has given genuine pleasure and satisfaction to his hosts of friends in the pharmaceutical world, not only in a personal sense as a deserved tribute to a friend but more broadly as indicating that pharmacy is coming into its own, is winning its way to a more important place among the arts and sciences. And Mr. Fairchild is thoroughly in sympathy with this higher ambitious spirit of pharmacy, having contributed materially to its development. Since his graduation by the Philadelphia College of Pharmacy, class of '73, he has worked unceasingly to promote the best interests of his profession, to dignify and advance the status of pharmacy as an art, a science, a business. Nor does he work as a theorist or an idealist, as he knows pharmacy in all its branches; he began to acquire practical knowledge of it in a retail drug store in Philadelphia when he was "working his way" through college, and after he was graduated he was for a time with Caswell, Hazard & Co., then the leading retail druggists of this city. Mr. Fairchild has "traveled" for a wholesale drug house, and has been in the retail drug business as partner of his brother, Benjamin T. Fairchild, who was even then working on the products that were to be known later as the "Fairchild" specialties. When the Fairchild Brothers entered the scientific and commercial world as manufacturing chemists, the one whom we are now discussing became the financial and general business manager of the firm, and these special departments of the house of Fairchild Brothers & Foster have all these years remained under his direct control and supervision.

While Mr. Fairchild is a loyal son of his alma mater and always ready to respond to any appeal in her behalf, he has long been actively interested in the College of Pharmacy of the City of New York, and served as president of that college from 1890 to 1896—a most notable and progressive period in the history of the institution. Dur-

ing these six years, the old building in East Twenty-third street, badly situated, unsanitary, poorly equipped and carrying a mortgage, was redeemed from debt and sold, a site was secured in West Sixty-eighth street, and a new building, the present home of the college, erected. It was said at the time that this was the first building in the United States that was planned, built and equipped especially for use in the teaching of pharmacy, and in "commodiousness and equipment it was not equaled by any college of pharmacy building in the country, or elsewhere."

A general reorganization of the work and affairs of the college was also effected during Mr. Fairchild's presidency. Its scope of instruction was widened and the most approved teaching modern methods and facilities were introduced. All this was accomplished largely through the efforts of its presiding officer and in the face of special difficulties at a time of financial depression and uncertainty ascribed to political agitation. Mr. Fairchild made

SAMUEL W. FAIRCHILD.

direct personal appeals for subscriptions, negotiated loans when necessary, exerted constantly a harmonizing influence upon the various elements represented in the membership of the college, and kept every force steadily directed toward the desired end. Upon his retirement from the presidency in 1896, the *Alumni Journal* of the college referred editorially to his "long, trying, faithful service of six years, during which great things have been accomplished for the college," and said, "He carries with him the gratitude of the whole pharmaceutical world for the success which has attended his efforts, and the highest esteem of all those whose privilege it has been to be associated with him in his work." The former president has continued to work for the welfare of the college and was one of those who were instrumental in bringing about its affiliation with Columbia University.

Mr. Fairchild keeps in close touch with pharmaceutical affairs all over the world, as a reader of the current literature of the calling, and through the business connections of his house. In England he has established an annual scholarship for students in pharmacy, the awarding of which is under the direction of trustees, men of high attainments in the profession.

Mr. Fairchild's interests and activities are wonderfully varied—one might almost say universal. Art and science, military, political, educational and financial affairs all appeal to him. His executive ability is well known and so it is that he is induced to serve on many city "committees" and "commissions"—for entertaining visitors from foreign lands, for planning and assisting at celebrations, etc., and he has been chosen to represent the city on spe-

cial occasions, having been one of the commissioners from New York at the Columbian Exposition at Chicago in 1893. He also has been for many years a member of the Union League Club of New York, which he has served on many important committees and as vice-president. At the last annual meeting of the club he was elected its president. This is no inconsiderable honor, since the Union League Club is second to none in the country in political influence and historic interest.

It may also be said of the versatile man now under consideration, that he is fond of outdoor life, is a veteran of the seventh regiment, national guard, State of New York, a "Son of the Revolution," a "Pilgrim," a member of the Chamber of Commerce of New York; that he is a member of the Metropolitan Museum of Art; was one of the incorporators of the Bronx Botanical Gardens; and is a member of the Metropolitan Club of New York, the Metropolitan Club of Washington, the Virginia Club of Norfolk, the Devonshire Club of London, and the Travelers of Paris; that he

Photo by Pach Bros.

HERMAN A. METZ.

is a trustee of the Bowery Savings Bank, a director of the Market and Fulton Bank, a member of the Chamber of Commerce, a vice-president of the Sevilla Home for Orphan Children, a trustee of the Fordham Home for Incurables, is president of the Oil, Paint, Drug and Allied Trades Republican Organization, and many other charitable and civic societies; and that he is at all times interested in everything which make for better citizenship and better manhood.

Perhaps a few words of a personal nature would not be out of place here: The temptation to say them is strong, for Mr. Fairchild's personality is interesting far beyond that of the ordinary man. He says much in a single sentence; sees much at a glance; goes quickly to the heart of things. "Do it now," "Cut it short," are mottoes in plain view on his desk—and they mean business. Yet Mr. Fairchild is neither unkind nor abrupt; even his reproof is tempered with consideration or with a dash of humor that takes away the sting, for he is humorous to a delightful degree. That he is kindly, sympathetic, warm-hearted, his employees and all his other friends know—yes, his employees are his friends.

Mr. Fairchild is of English ancestry, directly descended from the Thomas Fairchild who came from England in 1632 and settled at Stratford, Conn.; and in that little New England town he spends at least one day of every week with his mother at the old home of the family, his birthplace.

It would not be fair to Mr. Fairchild to reckon his age according to his accomplishments. He is a young man, distinctly of this day and generation, erect, alert, keenly aware of all that is going on, and his characteristically vitalizing influence is felt in many directions that lead to

progress and to ways of making the world a better and happier place to live in.

Herman A. Metz.

At the annual commencement exercises of Union University held at Schenectady recently, the degree of Doctor of Science was conferred upon Herman A. Metz, of this city. Dr. Metz is a well-known figure in drug and chemical circles and an example of what energy and a determination to "get there" can do for a young man.

He is a native New Yorker, having been born in this city October 19th, 1867, where he received his early education in the public schools, finishing, however, at the Newark High School in New Jersey. He began his business career as an office boy in the establishment of P. Schulse-Berge, which later became the corporation of Victor Koechl & Co., dye and chemical importers.

While employed young Metz studied chemistry at Cooper Union, and was graduated with honors. Hard work brought him promotion and he became successively, laboratory assistant, chemist, city salesman, traveling salesman, and organizer and manager of branches in Boston and Chicago. He was made vice-president of the concern when he was only twenty-seven years old, and six years later became its president and virtually its owner.

In 1903 to divide the pharmaceutical and chemical, and dye-stuff branches of the business, two corporations were formed, Herman A. Metz & Co., and the Consolidated Color and Chemical Company, of both of which, as well as of many others, he is president.

In addition to his exceedingly active business career Dr. Metz has found time to take part in political affairs, both State and national. He was elected comptroller of the city of New York in 1905 and held that office for four years during the McClellan administration. He has also served the city in various other capacities, and in addition is a member of many organizations, fraternal, athletic, social and commercial.

Two Baltimore Notes.

Hynson, Westcott & Co. will have one of the largest as well as most attractively equipped stores in Baltimore after improvements in contemplation have been completed. The firm intends to take in the lot adjoining, the building on which will be replaced by a new one. A front, uniform in design with the one on the new edifice is to be erected on the corner, and both buildings will be carried up to a height of four stories. The firm has leased both buildings for a term of years and will occupy all except the second floor. The prescription department will be taken care of down stairs, instead of being on the second floor, as at present, and the third and fourth floors will be devoted to laboratory processes, the operations of the firm in this respect being largely extended. The store will occupy a space 40 by 60 feet, and new furnishings will be installed, every detail being arranged in conformity with the idea of conducting an ethical pharmacy.

Dr. E. F. Kelly, for about eight years with Sharp & Dohme, most of the time as superintendent of laboratories, has connected himself with the Burrough Bros. Manufacturing Company, and will be active along lines similar to those pursued in his former position. In addition he will become a member of the faculty of the department of pharmacy, University of Maryland, taking charge of the pharmaceutical laboratory there. Dr. Kelly is a graduate of the Maryland College of Pharmacy and has been for some years secretary of the Maryland Pharmaceutical Association, as well as of the Baltimore branch of the American Pharmaceutical Association.

Maybe he was sarcastic, this old druggist, and maybe he saw several inches beyond his nose, but this is what he said: "The brush counter and candy department is getting to be more important in the drug business than the drugs themselves. Nowadays druggists can sell 'patents' and semi-'patents' at less than cost as a bait for their food department." As people grow wiser they give "patents" and semi-"patents" a wider berth, and depend more for health upon happiness and good, pure things to eat and drink.

Says an Erie (Pa.) newspaper: "Three surgeons were called to prove that he would always be a sufferer from chromatic epilepsy." Did he believe it?

Kings County Society.

The annual meeting of the Kings County (N. Y.) Pharmaceutical Society was held at Brooklyn, June 13th, at which time the roll of members received an addition of seven new names and was lessened by the deletion of the names of six members who were dropped on account of arrearages in dues.

With Vice-President Douden in the chair the president, J. H. Rehfuß, read the annual message of his office. He referred with pride to the condition of the society's affairs which flourished despite the competition of a number of other pharmacal organizations of recent birth. It was his opinion that the society was not adequately represented among the members of the New York Board of Pharmacy and he advised that efforts be made to better this situation. The report comprised also a brief summary of the legislative and propagandic work prosecuted during the year and the continuation of the propaganda in behalf of official medicaments was urged.

As president of the Brooklyn College of Pharmacy, Mr. Rehfuß praised the faculty of the institution to whom he said was largely due the gratifying prosperity of the college. He did not favor the proposition to unite the college with other educational institutions of the city to form a university. Mr. Rehfuß made the suggestion that the earnings accruing from the funds of the college not used for the extension of the equipment be applied to the establishment of free scholarships. In conclusion he thanked his colleagues and expressed a desire to be permitted to retire from the presidency—he had served four terms.

Treasurer Adrian Paradis reported that during the year the society had collected \$950 from its members and had a balance of \$345.68 in the treasury. The college funds had been increased by \$25,772 collected from students during the year; the expenses of the college had been \$20,042.59, of which \$15,988 was paid to the faculty; the institution was free from debt and had in its treasury \$12,793.68.

Secretary A. E. Hegeman reported that the society had 469 members only twenty-seven of whom owed any dues. During the year thirty new members had been acquired, six members died, eight resigned, and twenty-one were dropped from the rolls.

For the committee on legislation Dr. William Muir reviewed at length the year's activity in law-making circles. He told of the efforts of the local board of health to restrict the sale of narcotics, the measure in the legislature aimed at lessening the hours of clerks' employment, the Spielberg anti-premium bill, the new law restricting the sale of hypodermic syringes and needles, the O'Neil bill to limit the powers of local commissioners, the Pollock bill to lower the qualifications for membership on the board of pharmacy, the Brennan bill to tax sellers of grape juice, the Shifferdecker bill relating to containers for poisons for retailing, the Turley bill anent the identification of the patient, and the Foley bill to admit certain persons to the practice of pharmacy. He also referred at length to the arraignment of druggists in the columns of a local paper and the Turley bill which was the result. And he characterized as impracticable the Foster federal bill providing for the stamping of narcotics, referring also to the Sherley stamp-tax measure.

In conclusion he remarked that the year had brought about closer co-operation among the various local organizations in legislative considerations.

C. E. Heimerzheim reported for the committee on trade matters which had through a detail man spread the propaganda of open-formula medicines among over 800 physicians of the city. The committee had distributed about 400 copies of the Physician's Manual of the U. S. P. and N. F., as well as many samples of official preparations. In addition the members of the society had been furnished with propagandic postal cards to be sent to physicians; all at a total cost of \$560.

This committee had taken up the question of increased commissions on telephone calls, but had no definite accomplishment to report.

Otto Raubenheimer, chairman of the committee on pharmacy, reviewed the offerings of papers made during the year, and told of the progress of the revision of the Pharmacopœia and the National Formulary. The next Pharmacopœia, he opined, would be issued in not less than three years.

Dr. Muir brought up the question of offering to the New York State Pharmaceutical Association a free scholarship

in the name of the society. In his opinion to do so might be advisable if some provision was made so as to preclude the miscarrying of the plan. He believed that if the offer was made as a second-year scholarship, students to whom the gift would be helpful would have a better opportunity of obtaining it than was the case when the competition was in preliminary education. Prof. F. P. Tuthill explained briefly how the State association allotted the scholarships. And the delegates to the State meeting were empowered to offer a scholarship.

At the suggestion of Dr. Muir the trustees and faculty of the college were empowered to act with regard to another free scholarship to be awarded to a student completing the first year.

Secretary Hegeman read a report from the trustees of the college wherein was embodied a very fervent endorsement of Dr. Muir for appointment as a member of the board of pharmacy. Prof. W. C. Anderson, in suggesting that the society concur in this endorsement, declared that in all justice to the society, the college and pharmacy in general it was right and proper that a man of the wide experience of Dr. Muir be appointed to the board. This sentiment met unanimous approval.

Dr. Muir thanked his friends for their appreciation, and setting aside, as he said, his personal desire to stay off of the board, he bowed to the wishes of the society and college and consented to be a candidate. As will be seen by reference to page 384, the regents decided not to force Dr. Muir to become a member of the board contrary to his personal desire.

The election of officers resulted as follows: President, C. O. Douden; vice-presidents, H. B. Smith and W. H. Bussenschutt; secretary, A. E. Hegeman; treasurer, Adrian Paradis; new trustees, W. J. Hackett and J. H. Rehfuß; censors, Otto Raubenheimer, J. J. Vetter, and G. R. Christ; and librarian, T. F. Raymow. W. L. Perkins was chosen as counsel.

Delegates to this year's meeting of other organizations were chosen as follows:

American—W. C. Anderson, Otto Raubenheimer, F. P. Tuthill, H. W. Schimpf, and Joseph Kahn.

New York—J. H. Rehfuß, William Muir, W. H. Weygandt, F. P. Tuthill, Joseph Kahn, G. R. Christ, C. E. Heimerzheim, and F. A. Cade.

New Jersey—F. P. Tuthill, C. E. Heimerzheim, W. H. Bussenschutt, H. W. Schimpf, and T. F. Raymow.

The Turley Bill Passed by the Assembly.

The Turley bill was passed by the lower house of the New York legislature, June 20th. The object of the bill is to make druggists, pharmacists or storekeepers, licensed to sell medicines or poisons, criminally responsible for the acts of apprentices or unlicensed employees filling prescriptions under their supervision, and to require every such druggist or pharmacist to sign his full name in his own handwriting upon every prescription filled by him or his employee and upon the label of every box or bottle containing the medicines compounded by him or them, pursuant to the prescription. Such signature is made *prima facie* evidence that the prescription was filled by the person whose signature is written on the prescription or label.

The bill also contains other provisions requiring the filing of certain reports with the secretary of state, the keeping of records of all prescriptions, and regulating the dispensing of medicines and poisons by druggists and pharmacists.

Violation of any of the provisions is made a misdemeanor.

Hypodermic Syringe Bill Becomes Law.

Governor Dix has signed the Boylan bill making it unlawful to sell at retail, or furnish any person other than a duly licensed physician, dentist or veterinarian, a hypodermic syringe or needle, without the written order of such physician, dentist or veterinarian. All sales must be recorded. Any infraction of the law is made a misdemeanor.

An explosion destroyed the greater part of the acetone plant of the Albany Chemical Works on Van Rensselaer Island, June 13th, and caused the death of one man and the serious injury of six others employed in the works. The pharmaceutical and chemical departments were not involved.

New York Retail Druggists' Association.

Two new members were enrolled at the meeting of the New York Retail Druggists' Association held May 26th. This meeting was of more than usual interest.

Peter Diamond reporting as chairman of the committee on legislation stated that the Spielberg bill, a measure fostered by the society in an endeavor to check the practice of giving premiums, would scarcely be reported out of committee. He urged his hearers to express to their representatives at Albany strong opposition to the Turley bill as then constructed. Representative Sherley's bill in congress to levy a stamp-tax on ready-made medicines and toilet preparations was condemned as hurtful and unnecessary class legislation.

The approaching appointment of two new members of the New York Board of Pharmacy has considerably attracted the attention of the association which still maintains its former stand that inasmuch as it is representative of a very large contingent of the pharmaceutical fraternity in this city, it should in justice be represented on the board. For this reason it was deemed proper to recommend to the New York State Pharmaceutical Association that among the names to be submitted to the board of regents be included those presented by the N. Y. R. D. The latter organization favored Dr. Joseph Weinstein and J. L. Lascoff, but Dr. Weinstein declared that under no consideration would he serve on the board and the association recommended Mr. Lascoff and Mr. Diamond.

L. Marmor read a paper on "Ideals," in which the author expressed his view of what was necessary to be done in order that pharmacy might be placed upon its proper plane. He also drew a picture of pharmacy in the future indicated by the present-day trend in the practice of medicine. Mr. Marmor's conclusions were somewhat to the effect that pharmacy or the science of preparing drugs will become superfluous and obsolete.

This paper was so well received that the association decided to have it presented at the meeting of the State association.

Continuing his talk on pharmacal jurisprudence begun at the previous meeting (see last month's CIRCULAR, page 329), Dr. Joseph Weinstein elucidated the provisions and application of the poison schedules of the pharmacy law. By means of a quiz he got almost all of his hearers to discuss this phase of the law and thus brought out the fact that the beliefs of druggists relative to the law's application to their daily practice are often far from correct. The speaker advised his hearers, especially those who employed only unlicensed assistants, to acquaint themselves with the provisions of the poison schedules, lest they abridge their rights or exceed them.

Mr. Marmor and Dr. Weinstein were thanked for their contributions to the interest of the meeting.

As delegates to the meeting of the New York State Pharmaceutical Association the association selected Dr. Weinstein, Mr. Diamond, B. C. Bernstein, M. Halpern, and B. Kirschstein.

New York Board Appointees.

On August 1st will expire the terms as members of the New York State Board of Pharmacy of Otto Raubenheimer, of Brooklyn; J. L. Lascoff, of New York; and John Hurley, of Little Falls. At the recent meeting of the New York State Pharmaceutical Association there were nominated as successors to these members, nine members of the association, as mentioned on page 389.

The board of regents makes the appointments, but is not confined by law to the nominees made by the association. The regents have appointed John R. Wall, of New York (one of the organizers and leading members of the drug clerks' association known as the National Pharmaceutical Society) to succeed Otto Raubenheimer, and the other two members whose terms expire, to succeed themselves. All these were association nominees.

Dr. Joseph Kahn has been made professor of pharmaceutical chemistry at the Brooklyn College of Pharmacy. This professorship is a newly established one, the subject having been taught by Dr. Kahn as lecturer.

Mrs. Elizabeth Baltzly, of this city, will continue the business of her late husband, A. B. Baltzly, under the same name.

New York German Apothecaries' Society.

The regular monthly meeting of the New York German Apothecaries' Society was held June 1st, President Kleinau in the chair.

After various communications, brought before the society by financial secretary, R. S. Lehman, and corresponding secretary, E. A. Broetzel, had been disposed of, S. V. B. Swann, chairman of the legislative committee, reported on various bills, of interest to the pharmacists, at present before the legislature. Particularly he mentioned the Turley Bill, and asked the members to unite in a formal vigorous protest against this bill, the protest to be sent to the leader of the assembly, E. L. Smith. In answer to the question of Mr. Broetzel as to what attitude the physicians had taken in regard to the bill, O. Raubenheimer said that the New York County Medical Society also had officially protested against it.

O. P. Gilbert, chairman of the entertainment committee, reported on the trip to Baltimore to visit the laboratories of Sharp & Dohme. He said that this visit, which was in every way considered a complete success, was immensely enjoyed by all who had participated in it. He asked that the society express their thanks both to the firm and to their representatives, in particular to G. T. Riefflin. This was done unanimously.

Mr. Gilbert reported that the preparations for the excursion to College Point on July 6th had been completed.

After President Kleinau had greeted the new members who for the first time attended a meeting, eight applicants for membership were elected.

A resolution offered by President Kleinau and supported by various members to elect Dr. A. R. L. Dohme an honorary member of the society, in recognition of his interest in pharmacy and in the affairs of the Germans in the United States, was adopted by acclamation.

President Kleinau then introduced the speakers of the evening, Dr. E. D. Feldmann and B. Zwilling, who gave a very interesting lecture and demonstration of the Langrehr safety tube for cans, etc., containing inflammable substances. A lively discussion followed these most interesting and important experiments.

After several subjects relating to practical pharmacy had been discussed by various members, the meeting adjourned until the first Thursday in September.

The corporation of Pond, Bowes & Cartwright, Broadway and Seventieth street, New York, has been placed in the hands of William J. Flynn, a receiver in bankruptcy. Some of the largest creditors are the American Druggists' Syndicate, \$4,935; C. H. Goddard, \$7,500 (loan); M. Howe (secretary-treasurer of a subsidiary A. D. S. company) \$5,000 (loan). In the petition in bankruptcy it was alleged that the corporation was insolvent, made a preferential payment of \$439 to the Alliance Realty Company and transferred large sums of money to other creditors. The concern was incorporated March 24th, 1910, with a capital stock of \$25,000. The liabilities are said to be about \$25,000 and assets \$12,000. It may be recalled by some that the Riker people made an offer for this store a couple of years or so ago, which was refused by its then proprietors. Soon thereafter a Riker store was opened about a block above it, whereupon Pond, Bower & Cartwright were willing to quit. Mr. Goddard, it was understood at the time, formed the corporation which took possession of the store, for the purpose of demonstrating how A. D. S. methods would bring victory out of defeat.

The New York chapter of the Philadelphia College of Pharmacy Alumni Association held its annual meeting and dinner on the evening of May 23d. The following officers were elected: President, S. W. Fairchild; treasurer, H. N. Fraser; secretary, C. A. Mayo; executive committee, David Costello, T. D. McElhenie and H. J. Schmidt; member of the advisory board, Joseph Healy.

There is some talk to the effect that the American District Telegraph Company of Brooklyn, with a charter which gives it the privilege of placing telephone wires anywhere in the State, is to pass into the hands of a company which will compete with the concern now holding a telephone monopoly in Greater New York.

Hon. Peder Jensen, of Tacoma, it is now, the well-known secretary of the Washington Board of Pharmacy having been elected to membership in the senate of that State.

Mr. and Mrs. Harry Skillman, of Detroit, sailed recently on the Olympic for a two months' visit to Europe.

New York State Association.

Although a bit slow in arriving the visitors to the meeting of the New York State Pharmaceutical Association held at Alexandria Bay, June 20th to 22d, outnumbered those of the preceding two years. While there was not "much doing" in a general sense, the anxiety felt because of the extra-pharmaceutical efforts to secure pharmaceutical legislation served to keep the attendants on the alert. There was a marked absence of airing of personal grievances and all was harmony.

All that might be desired in the way of weather conditions existed, and as an outing the occasion was most beneficial. The St. Lawrence brand of ozone is certainly good for lungs tired of the drug-shop atmosphere.

For next year's meeting place Sacandaga Park, Fulton county, was selected. This selection, it is rumored, is not final.

THE OFFICERS.

These are the officers elected for the ensuing year: President, C. B. Sears, of Auburn; vice-presidents, L. J. Schlesinger, of Yonkers; J. H. Rehfuess, of Brooklyn; and C. N. Cook, of Alexandria Bay; secretary, E. S. Dawson, of Syracuse; and treasurer, Frank Richardson, of Cambridge. The members of the executive committee are C. H. Lehmann, of Tottenville; Peter Diamond, of New York; and A. W. Palmer, of Olean.

First Session, Tuesday Forenoon.

At 10:30 A. M., June 20th, the thirty-third annual convention of the New York State Pharmaceutical Association was convened at the rap of the gavel in the hands of President A. S. Evans, of Utica. The attendance was not quite so large as had been characteristic of the opening sittings of recent years, but the assemblage was made up of representative members from a wide territory.

While awaiting the arrival of J. B. Reid, the president of Alexandria Bay, several announcements relative to transportation and registration were made by Secretary E. S. Dawson, of Syracuse. These were followed by the posting of the names of a number of persons making application for membership in the association.

As Mr. Reid's appearance was further delayed, the president introduced H. W. Marshall, of Alexandria Bay, who in a few happy sentences welcomed the visitors on behalf of the druggists of the town. Treasurer Frank Richardson, of Cambridge, responded to the welcoming in his well known anecdotal vein.

Several communications and further announcements were read by the secretary; and Vice-President C. B. Sears, of Auburn, occupying the chair, President Evans read the following annual message:

PRESIDENT'S ADDRESS.

It is certainly a great thing for a man to be able to stand before such a gathering of his fellow-men and call them all friends. I am glad and proud to say that I feel you are all my friends. In these days, the world judges a man by the things he has accomplished; his friends by what he has tried to accomplish, although he may have failed. So if I have failed in any way to come up to the mark you expected me to, I do not fear your judgment.

The Association.

I have feared and still fear there may be a falling off in attendance and interest in the meetings, since we no longer elect the members of the board of pharmacy. But as we nominate and submit the list of names for the regents to choose from, we still, to a great extent, control the membership of the board; for so long as we choose men of such standing and integrity as we have in the past, the regents are bound to respect our choice.

I have tried to devise some means to create interest, but in this I have failed. I urge each and every member to take advantage of every possible opportunity of informing non-members of the benefits of membership, of what we have done for them, and how much more it is possible for us to accomplish with a larger membership.

The Board of Pharmacy.

We realize that the board has been handicapped during the year, as the regents were late in making appointments and the powers that be were slow in furnishing the necessary funds to do the work. But I know I voice the sentiment of all present when I say we have perfect confidence in them all.

My opinion, I can best state in the words I used when interviewed by the New York World representative, regarding the Turley bills. I was informed it was for publication, but as they failed to publish it, I give it here: "The New York State Board of Pharmacy, appointed by the regents, has the power and is qualified to make all necessary rules and regulations to regulate the drug business and protect the public, and is better fitted to do so than those who know nothing about the business."

Yellow Journalism.

The pharmacists in New York have been attacked in the most vicious manner by the New York World. They have been

charged with carelessness, incompetency, using inferior and adulterated drugs, and wilful substitution. I do not believe these charges. The nature of the drugs selected for its sample prescriptions show the intent, on the part of the World of getting evidence regardless of facts, and it has stooped to so many fallacies and misrepresentations that we are compelled to discredit the whole affair. In introducing the Turley bills this paper has shown how little it knows regarding the drug business, and the assistant district attorney, who framed the bills, has plainly shown either his ignorance of, or absolute disregard for, the fundamental principles of law.

Legislative Work.

This year we expected little to do along legislative lines, but since February there has been a number of bills introduced which will be taken up in the legislative committee's report. Right here I wish to thank the members of the committee and the large number of other members of the association on whom I have called, for their hearty support and response to my requests. The association owes a vote of thanks to Dr. William Muir for his faithful and untiring work in its behalf. He has ever been on the alert, has let nothing escape him, and has never failed in any respect to do the right thing at the right time. I might add that in this respect Dr. Muir has but continued the loyal, hearty, earnest work of previous years.

I wish to go on record against local organizations introducing bills without first submitting them to this association or to its legislative committee, as in the majority of cases they are framed to affect some local condition, and would work a hardship to other parts of the State, whereas, if they were submitted to the association or a committee representing different parts of the State as our committee does, they could be framed to accomplish the desired result without hardship to anyone. Another thing, while a bill may be a good one, you must consider well if it can be passed. Consider whom it is aimed against, who is on the health committee of the senate and assembly; for a good bill introduced and defeated may interfere with future legislation along the same lines, so my advice is: Go slow.

The Committees.

I will not attempt to cover the work of the various committees. They have performed their work well I know, and you will be interested in their reports. There are two new committees whose reports we await with special interest. I refer to the committees on scholarships and on the revision of the U. S. P.

The National Association of Retail Druggists.

The N. A. R. D. seems to have been revived and is working along new lines with new methods and ideas, and I advise that before any action is taken, we investigate thoroughly into its present condition and judge it in an open-minded way, forgetting any prejudice that we may have had in the past. We are honored by having the president with us at this meeting, and at some future time during the proceedings we will be glad to hear from him in regard to the present work and plans.

The Commercial Travelers' Auxiliary.

Our good friends, the commercial travelers, have become a necessity, contributing to our business success, and on them rests to a very great extent the future success of this organization. To my mind it has been plainly demonstrated that all hope of future growth in the membership of this society rests almost entirely in their hands.

As an experiment, I sent out letters to a list of thirty-five live druggists, who are not members of the association, and followed these up with a second letter, enclosing application blanks in both cases, stating the work we are doing, and inviting them to join the association, and I am sorry to say I did not receive a single reply, while our commercial ambassadors have been gathering in applications on all sides. On behalf of the association, I thank them for their good work along these lines, also for their willingness to help at all times, and for the entertainment they have so generously prepared for us.

The Press.

We are indebted to the gentlemen of the pharmaceutical press for their friendliness, encouragement and readiness to assist at all times. They have been instrumental in defeating unfavorable legislation, both State and national, and I wish to express my thanks and good wishes to them all.

It is with sorrow I have to report, that during the past year Providence has removed from our midst a number of members, whose names will be shown in the secretary's report.

In concluding this message, I would be lacking in appreciation if I failed to express to every member of this association, the officers and the committees my sincere thanks for their many acts of kindness to me, and their hearty co-operation during the term of my office. I fully appreciate the honor of having held the highest office in this association, and hope in the future to contribute to its success as a private in the ranks. To each and every one of you I extend my best wishes for health and happiness.

This address was duly and enthusiastically received, and was referred in the usual order to a committee consisting of Prof. W. C. Anderson, of Brooklyn; William Muench, of Syracuse; A. S. Wardle, of Hudson; L. J. Schlesinger, of Yonkers; and C. A. Drefs, of Buffalo. As this committee was entrusted with the consideration of several additional matters its conclusions are all to be found in the report of the sitting.

Next in order came the report of the secretary's office, which was as follows:

SECRETARY'S REPORT.

The annual Proceedings were published by a firm in Syracuse, at a price of \$1.22 per page, and, as there were 274 pages in this, as against 320 pages in last year's book at a price of \$1.20 per page, the cost was less than that of the latter.

Owing to the fact that our president could not appoint the committee on legislation until after the regents had appointed the members of the board of pharmacy, his list of appointees did not reach your secretary until late in October, and as soon as possible after that, the books were mailed to the members of the association.

It is with profound sorrow that your secretary makes announcement of the decease of the following members:

Dwight Marion Bowers, of Sidney; George Washington Brooks, of Brooklyn; Charles K. Crowell, of New York; Wilfred B. DuBois, of New Paltz; Charles Houghton, of Rochester; Fred Harry Mason, of Friendship; William T. McBay, of Rochester; Theodore M. Millspaugh, of Liberty; Elmer C. Root, of Hamilton; Edwin Wall, of New York; and J. Leroy Webber, of Brooklyn.

Your secretary is again privileged to express his grateful appreciation of the courtesies extended him by the officers of the association, in the performance of his official duties, and, to the members of the Commercial Travelers' Auxiliary for their efforts to enlist new members in our ranks.

At the last meeting eighty (80) new members were elected, and our association shows a fairly gratifying growth, although the losses in membership, through deaths, resignations and dues arrearage penalties have been considerable.

At the publication of the last proceedings the list of active members numbered..... 1361

There have since died (as far as known)..... 11
Resigned 20
Dropped from roll..... 6 37

Total present membership..... 1324

(Some of whom are in arrears for dues.)

Official acknowledgment is made of the receipt of the following publications: Alumni Report of the Philadelphia College of Pharmacy, American Druggist, Apothecary, Bulletin of Pharmacy, Deutsch-Amerikanische Apotheker-Zeitung, The Druggists Circular, Merck's Report, Meyer Brother's Druggist, Midland Druggist, N. A. R. D. Notes, National Druggist, Pharmaceutical Era, Practical Druggist, The Retail Druggist, Southern Pharmaceutical Journal, and "The Voice" of the Retail Druggist. Copies of annual Proceedings were received from the National Wholesale Druggists' Association, and from the pharmaceutical associations of thirteen States, a courtesy that your secretary reciprocated.

The records of the last annual meeting, as compiled from the official registers, exhibit the following:

Total number of traveling men in attendance..... 30
Members in attendance..... 121
Ladies in attendance..... 40
Traveling men in attendance not members..... 11

Total attendance..... 191

The expenses of the office have been as follows:

Traveling expenses, etc., at Saratoga Springs..... \$43.10
Secretary's salary..... 300.00
Stationery and printing..... 60.00
Publishing Proceedings..... 332.49
Postage on same..... 72.45
Postage on meeting notices..... 13.20
Postage on certificates..... 4.10
Other postage expenses..... 24.30
Engrossing certificates..... 10.25
Mailing tubes..... 2.75
Half-tone plates..... 11.64
Expressage on stationery, etc..... 6.70
Office supplies..... .90

Total..... \$881.88

Bills, covering most of these items, are in the hands of the executive committee.

This report was received and referred for printing.

Treasurer Richardson reported as follows:

TREASURER'S REPORT.

Receipts.

Cash on hand last report..... \$1,243.07
Dues of members..... 1,846.10
Applications for membership..... 278.00
Greater N. Y. A. D. S..... 32.68

\$3,399.85

Disbursements.

Fred S. Rogers, legislative committee..... \$28.30
F. R. Brothers, executive committee..... 1.45

\$2,062.64

Balance on hand..... 1,337.21

\$3,399.85

REPORT OF THE BOARD OF PHARMACY.

In accordance with the provisions of the pharmacy law W. L. Bradt, secretary of the New York Board of Pharmacy reported on the affairs of that body during the past year. Because the fiscal year of the board was not completed and also because of the delay in the inauguration of the new board's work this report was somewhat unfinished. It had to do chiefly with the relation of the formation of the board and the plans it had adopted for the performance of its duties.

The report was received in the usual manner.

Some little discussion took place at this time anent the feasibility of fixing an hour earlier than that scheduled for the selection of nominees to be recommended to the board of regents for their consideration in choosing successors for the members of the board whose terms expire this year. It was decided, however, to adhere to the time stated in the official program, 12 o'clock noon of the second day of the convention.

Secretary Dawson read a communication from Thomas Lamb, of Brooklyn, in which it was proposed that article 8 of the constitution of the association be amended to read as follows:

The annual meeting of the association shall be held at such time and place as the association from year to year shall select. Providing that once in every three years said annual meeting of the association be held in any one of the following counties, to wit: New York, Westchester, Kings, Queens, Nassau, Suffolk, or Richmond.

As is provided in such cases action on this proposed amendment was deferred until the 1912 meeting.

A suggested model for a bill to restrict the publication in newspapers of details of homicides and suicides by poison, which had been forwarded from Philadelphia, Pa., was read by the secretary. In due order it was referred to the consideration of the committee on the president's address.

Next came a recital of the association's most interesting and perhaps most important work of the year in the report of the committee on legislation, which was read by Dr. William Muir, of Brooklyn. This report was as follows:

REPORT OF THE LEGISLATIVE COMMITTEE.

Undoubtedly it was the hope of the members of the association that the continued efforts to inflict drastic and unwholesome legislation upon the pharmacists would cease immediately upon the enactment of the new pharmacy law by the legislature of 1910. In this, however, the officers of the association and the members of the legislative committee have been disappointed, for in no recent year have such strenuous efforts been necessary to circumvent the plans of designing men promoting legislation intended to harass the pharmacists. The source of many of the measures projected is easily surmised, while the reason for the exploiting of others cannot be understood except as an effort on the part of some office-holder or newspaper man to advertise himself before the public; and, in looking around for that which will more readily alarm the men and women of the land, the druggist, because of his intimate relations with all classes, seems to have been seized upon as the one more easily attacked with the greater resultant publicity and alarm. After the experiences of the past year your committee may be pardoned if reference is again made to the absolute necessity for a stronger co-operation of all the pharmaceutical interests through organizations, equipped to meet these attacks, and, because of such organization, able to overcome many of them. The members of the State association can do themselves and their profession no greater benefit than that each member shall see to it that every pharmacist in the State of New York is enrolled upon our membership, thereby strengthening the usefulness of the association and insuring it representative character in repelling attacks made upon its members. Unless this is fully accomplished, and every reputable pharmacist in the State owes allegiance to the State association, the unfounded and scandalous attacks which have been made upon the profession of pharmacy by agitators, particularly among newspaper men, will continue and must ultimately impair the confidence of the people in our profession. The tremendous labor of your committee before congress and the State legislature, combating measures inimical to our welfare, justifies the foregoing statement.

During the early part of January, 1911, the attention of your committee was directed to the so-called Foster bill, H. R. 25241, pending before the committee on ways and means of the house of representatives, and by direction of the president of the association your committee attended the hearings upon the bill and with representatives of the allied branches of the drug trade protested against its passage. Singular to relate your committee was the only representative of any of the State pharmaceutical associations of any of the States of the Union appearing in direct opposition to the measure. The bill originated with the so-called United States opium commissioner, Mr. Wright, and if enacted would have entailed enormous labor upon the retail pharmacists by requiring the keeping of a detailed record of every sale of prescription or preparation containing opium, coca, cannabis indica, morphine, or any other narcotic drug. It further required that each pharmacist should pay a license fee of \$1 and furnish a bond costing anywhere from \$10 to \$20, and in addition to this it further required that the pharmacist should make minute and detailed monthly reports of all sales and purchases to the internal revenue col-

lector. Notwithstanding the enormous burden thus imposed upon the pharmacists, no claim was made that the Foster bill would stop the sale of the narcotic drugs aimed at, but on the contrary it provided that a license to sell these drugs might be issued to any person who could pay the fee, be a registered pharmacist or otherwise. The only reason advanced in favor of the bill was that it would provide valuable statistical information upon which to establish future legislation. Voluntary efforts were made by several of the members of the State association, upon a given date, to comply with the regulations in the Foster bill, with the result that it was found to be utterly impossible and impracticable to do business honestly under them. Your committee endeavored by personal conferences and by correspondence to show the utter inability of the retailer to comply with the requirements of the bill and are happy to say that largely through the efforts of the committee the bill was killed.

Another bill of special interest is the bill introduced in the special session of the present, or sixty-second congress, by Mr. Sherley "to provide revenue by a stamp-tax on proprietary medicines, and so forth, and for other purposes," which measure is now pending before the ways and means committee of the house of representatives. Your committee filed an earnest protest against this measure and communicated the wishes of the pharmacists of this State to every member of congress. At the present time the bill is still in the ways and means committee and we have the assurance of that committee that the bill will not be acted upon.

Pursuant to the resolution adopted at the meeting of the association held at Saratoga, your committee prepared a bill relative to working hours of pharmacists in drug stores, which was introduced in the senate by Mr. Ferris, and in the assembly by Mr. Allen. The bill reduced the number of working hours from 140 to 132 hours in each two weeks, and applied generally all over the State. This bill has passed the assembly and upon consideration by the senate was amended to meet a constitutional objection. This having been overcome, we are assured that the bill will pass the senate and as amended will be concurred in by the assembly and thus become a law.

At the instigation of the New York Retail Druggists' Association, to correct a growing and demoralizing evil in some parts of the city of New York, a bill was introduced by Assemblyman Spielberg prohibiting premiums with sales by retail druggists. Your committee earnestly supported this bill, but because of the opposition from the trading-stamp concerns has been unable to secure its report from the assembly committee on codes.

A very objectionable measure, in its original form, was introduced in the senate by Mr. McManus, and in the assembly by Mr. Boylan, to amend the public health law in relation to the selling of hypodermic syringes and needles. Your committee attended the hearings on this bill and succeeded in having incorporated several amendments which perfected the bill so that the committee was justified in supporting the same, with the result that the bill is now a law.

One of the daily papers in the city of New York has, for some unknown reason, been conducting a malicious crusade against the pharmacists, resulting in considerable alarm among the people; and has been professing to cure the evils complained of by bills introduced by Assemblyman Turley, a representative from the Bronx. To one of these bills your committee has made no objection, being content with an effort to perfect it by amendment. The bill requires that every physician's prescription shall contain a statement as to whether the medicine is for an adult or for a child, and if for a child, must state the age thereof. This bill has passed the assembly and will no doubt pass the senate and become a law.

The other bills exploited by the newspaper and introduced by Mr. Turley are, however, of a different character, and have given your committee considerable work and anxiety. The bills have taken on different forms and have contained different radical and ridiculous propositions, some of which have been so manifestly unjust and unreasonable that the argument of your committee compelled the abandonment of the bill. It is unnecessary, therefore, to recite the provisions of the measures which have been abandoned, and your committee will content itself with a summary of the last bill introduced and pressed by Mr. Turley for passage.

It provides that every pharmacist, druggist or storekeeper, licensed to sell medicine or poisons, shall be criminally responsible for the act of any apprentice or unlicensed employee filling any prescription. This provision is manifestly unconstitutional.

That every pharmacist who fills any prescription for drugs, poisons, etc., shall, in his own handwriting, write his full name, with his license number, his house address and the date on which the said drugs, etc., are prepared, upon the label of each box, bottle, package, or vessel containing the compound, and shall also write the same information upon the prescription or order used and shall then file same and shall also, in his own handwriting, file the required entries in a book provided for under the bill. This shall be prima facie evidence that the said prescription was prepared by the proprietor or employee in the pharmacy in which said prescription may have been filled. This provision is a direct conflict with the pharmacy law, the health law and the penal code.

That every licensed pharmacist, druggist or storekeeper shall on January 1st of every year file with the secretary of the State board of pharmacy, in his own handwriting, a report giving his full name and address, his license number, the date of such license, the persons or places where employed of every registered pharmacy or drug store shall keep a book during the year prior to such report, etc. That the proprietor for the entry of (a) the name and address of the physician purporting to have made the prescription; (b) the date of receipt of said prescription; (c) the drug, chemical, medicine or poison prescribed; (d) the date on which the drugs, etc., are prepared for dispensing; (e) the name, license number and house address of the individual who filled the prescription. The said book shall be open every day for the inspection of the district attorney or coroner, the mayor, the head of the police department, and the head of the board of health, or any authorized agent thereof.

The prescription filled shall be kept available for inspection for a period of five years, together with all of the information written thereon by the pharmacist.

On the first days of January and July each year a report under oath shall be filed with the secretary of the State board of pharmacy giving a record of all employees engaged in his establishment for the six months prior to such report.

It is required that every physician shall have his name and office address written or printed upon every prescription given by him. The penal provisions of this act are severe.

The extraordinary character of the bill finally reached by Mr. Turley is so thoroughly appreciated that it is impossible for him to secure the passage of the bill without radical amendments thereto. Your committee has been unceasing in its opposition to this measure, and we are happy to report that it has been amended and its provisions so modified as to remove a great many of the objectionable features complained of. Whether this will satisfy the apparent insatiable desire of the newspaper referred to, your committee will not venture to predict.

A bill was introduced by Assemblyman O'Neill to meet the conditions imposed by the regulation of the health departments in some of the cities of the State, particularly the city of New York. The measure provides that where the public health law provides for the regulation and supervision of the sale of drugs, etc., for medical purposes, local authorities shall have no power to pass any ordinance or regulation in relation to such sale and that where such local ordinance or regulation has been promulgated it has no effect. This bill still remains in the committee on public health.

An attempt to amend the present pharmacy law which originated in the State association was made in a bill introduced by Senator Pollock, proposing to strike out the requirement that an examiner employed by the board of pharmacy shall have practiced as a pharmacist for at least ten years in this State. It further provides that the secretary of the board shall not necessarily be a licensed pharmacist who has legally practiced for at least ten years in this State, and substitutes therefor a provision that the secretary shall be "a pharmacist licensed to practice," also that the secretary shall not be appointed by the regents and hold office during their pleasure, but that he shall be appointed by the governor for a term of three years. This measure your committee opposed most energetically before the senate and assembly committees on public health, and we are pleased to report that the bill has not been reported from either of said committees.

Another interesting measure was introduced by Assemblyman Brennan, of New York. It provided that any person selling grape juice in quantities of one gallon, quart, or less, must pay a tax of \$150 for the privilege and obtain a certificate authorizing him to sell grape juice at his place of business, but only such grape juice manufactured in the State of New York or manufactured from grapes grown in said State. This bill entailed considerable work upon your committee, and it is, therefore, with pleasure that we report that the bill has been killed.

An old friend in a new form appeared in the bill introduced by Assemblyman Schifferdecker and Senator Sanner, both from Brooklyn. This bill attempts to put into the pharmacy law a provision that no retailer shall sell or furnish any of the poisons of schedule A and B in liquid form except, in addition to bearing a poison label, such poison shall be in a bottle of peculiar shape or in a bottle having a cork or stopper of peculiar shape to apprise any person handling the same, by sense of touch, that the contents thereof contain poison or poisonous ingredients. It is unnecessary to point out the ridiculous character of this proposition. As first introduced it applied to wholesalers, but was subsequently amended and now applies to retailers alone. As amended it passed the assembly and is now in the senate. Your committee, however, has filed the strongest kind of protest against it and has been instrumental in procuring a large number of protests from pharmacists all over the State against it. We are, therefore, justified in the belief that the bill will fail of passage in the senate.

Another old friend appeared in the shape of a bill introduced by Assemblyman Foley, of New York, authorizing the admission to the practice of pharmacy of a man who had not qualified under the law. One hearing before the committee was sufficient to kill this bill.

Your committee regrets exceedingly its inability to report at this time the final disposition of some of the measures herein referred to. This, however, is easily understood when it is remembered that the session of the legislature has been unduly prolonged, and even now both houses are in session.

One of the matters which gave rise to great excitement in the city of New York during the year was the ordinance adopted by the board of health in the city of New York, August 26th, 1910, amending section 182 of the sanitary code so as to prohibit the sale of any preparation containing opium or morphine, or their salts, except upon the prescription of a licensed physician. Appreciating the importance of this subject your committee called a meeting of representatives of all of the pharmaceutical organizations in the city of New York, the State association being represented by Dr. Muir of this committee, who was elected chairman of said conference. Numerous conferences were held with the board of health and the ordinance was amended from time to time. Finally, on March 21st, 1911, the following ordinance was agreed to by the members of the conference and the board of health and adopted in lieu of the former amendments to section 182 of the sanitary code.

BOARD OF HEALTH ORDINANCE PERTAINING TO SALE OF NARCOTICS.

(Section 182 of the Sanitary Code as Adopted at the Meeting of the Board of Health, March 21, 1911.)
Section 182. No cocaine or salts of cocaine, eucaine, stovaine, alpha- or beta-eucaine, either alone or in combination with other substances, or any substance under any other name giving a similar chemical test of cocaine; and no opium or official preparation of opium, and no morphine or salts of morphine, or the derivatives of either or any of them, shall be sold at

retail by any person in the city of New York except upon the written prescription of a physician, duly authorized to practice as such or other person duly authorized by law to practice medicine and administer drugs, or perform surgery with the use of instruments.

Nothing hereinbefore mentioned, however, shall apply to compounded mixtures containing opium or morphine or their derivatives, the formulas for which are given in the latest dispensatory or the National Formulary, in which said mixtures the maximum dose, as plainly stated on the label of the package as dispensed, does not contain in excess of one-half a grain of powdered opium or the equivalent of its alkaloids; or to preparations for external use only, in the form of liniments, lotions, ointments or oleates.

The last mentioned preparations shall be labeled "For External Use only," and marked "Poison."

With a desire to bring about co-operation between the State association and the several local associations throughout the State, your legislative committee called a conference at the Hotel Ten Eyck, at Albany, February 9th, 1911, which was attended by the following: For Kings County Pharmaceutical Society, Dr. William Muir; New York branch American Pharmaceutical Association, T. P. Cook; New York Retail Druggists' Association, Joseph Weinstein; New York German Apothecaries' Society, Felix Hirshman; Drug Trade Section of the New York Board of Trade, T. P. Cook; Metropolitan Drug Club, T. P. Cook; Italian Pharmaceutical Association of State of New York, Vito Calcagno; National Pharmaceutical Society, B. H. Kirschberg; Brooklyn Pharmaceutical Association, E. C. Krausche; Retail Druggists' Protective Association of Brooklyn, S. L. Neier; Long Island Drug Club, S. L. Neier.

A general discussion was had upon the bills then pending in congress and in the legislature, and a uniform line of action was determined upon. It was also decided to procure the introduction and passage of the bill above reported upon and known as the Ferris-Allen shorter hour bill. The matter of the introduction of a bill to prevent a physician signing a death certificate in case the physician had dispensed his own medicine to the patient was discussed and it was finally decided not to introduce such bill until it had been considered by the State association. Your committee therefore recommended that this proposition receive the earnest consideration of the members present at this annual session.

Discussion arose as to the probability of the establishment of a national board of health, and the conference decided that the organization of such commission should consist of three physicians, two chemists and two pharmacists. No definite action, however, was taken upon the main proposition itself, and your committee recommends that the matter receive the attention it deserves at this meeting of the association.

Attached hereto are copies of several bills and circulars which have been issued through the instrumentality of your committee during the past year.

Your committee cannot close this report without expressing regret that the old-time friends of the pharmacists, Senator Hill, of Buffalo, and Assemblyman Whitney, of Saratoga, were not members of the present legislature. Only the men who have been in constant touch with the legislation herein reported upon can realize the loss of the friendship these stalwarts have always given to the pharmacists. In their absence we have, however, had the active co-operation and friendship of Assemblyman Edward Merritt, of St. Lawrence, Assemblyman F. W. Hammond, of Syracuse; Assemblyman H. E. Allen, of Oneida county; Senator T. Harvey Ferris, of Utica, and Assemblyman M. S. Beach, together with the co-operation of our associate, Assemblyman Brown of Cortland. To these men are due the thanks of the pharmacists of the State of New York for their efforts to protect the welfare of our profession, and through it the health and the welfare of the people of the State.

Supplementary to this report Mr. Wardle recounted some of his experience in arousing druggists to an appreciation of the work of the association in legislative channels. He also advised the members present to express at once to their representatives at Albany their opposition to the Turley bill fostered by the New York World. J. B. Todd, of Ithaca, and Dr. A. B. Huested, of Delmar, also called attention to the value of the work of the legislative committee.

The report was referred to the committee on the president's address.

In the discussion of the foregoing report several references were made to the fact that if druggists generally recognized the value of the legislative work of the association they would better appreciate the usefulness of the organization. With a view to bringing this about, the committee on the president's address was instructed to consider a plan for hiring a paid canvasser for the purpose of spreading the doctrines of the association and securing members.

Adjournment was then taken, at 12:15 o'clock.

Second Session, Tuesday Afternoon.

President Evans resumed the chair at 2:40 p. m., and after the usual routine had been disposed of, including the posting of the names of thirteen more applicants for membership, the president named as the committee on credentials, C. A. Drefs, James Clary, and C. H. Bernstein.

As the next order of business was taken up the report of

the committee on pharmacy and queries presented by the chairman, Dr. F. P. Tuthill, of Brooklyn, and reading as follows:

REPORT OF THE COMMITTEE ON PHARMACY AND QUERIES.

Shortly after January 1st the chairman notified the other members that this was a committee of three, and that each member was expected to procure a certain number of papers as his share of the work, in any way that he desired; no general plea for papers was issued.

The committee finds it somewhat difficult to procure papers, due to the fact that not proper time is allowed for the reading and discussion of same. It is not fair to have a member spend time and money getting up a paper and then have it hurriedly read, or many times read by title. We believe that if the association desires this work to continue more time should be given to this committee to properly dispose of the results of its labor.

The Meyer Brothers Druggist, of St. Louis, has offered to this association three prizes for the best papers offered at this meeting: First, A three-year subscription to the Meyer Brothers Druggist; second, a two-years' subscription to the Meyer Brothers Druggist, and third, a one-year subscription to the Meyer Brothers Druggist.

The following papers are presented for your consideration: "Stems in Drugs," by Dr. Henry N. Rusby, of New York; "Organic Synthetics," by Dr. Joseph Kahn, of Brooklyn; "Little Sins at the Prescription Counter," by Dr. Curt P. Wimmer, of New York; "The Hot-Plate a Handy Drug Store Apparatus," by Dr. Joseph L. Mayer, of Brooklyn; "Naturally Occurring Cube Substitutes," by Dr. William Mansfield, of New York; "Tincture of Larkspur," by Otto Raubenheimer, of Brooklyn; "The Essentials of a Reputable Pharmacist," by J. Leon Lascoff, of New York; "Restrictions in Pharmacy Here and Abroad," by Bernard Cole, of New York; "The Misuse of Wood Alcohol," by Otto Raubenheimer, of Brooklyn; and "Ideals," by L. Marmor, of New York.

This report was duly received, and the reading of the papers was taken up in the following order: "Naturally Occurring Cube Substitutes," by Prof. William Mansfield, of New York; "Organic Synthetics," by Prof. Joseph Kahn, of Brooklyn; "The Essentials of a Reputable Pharmacist," by J. L. Lascoff, of New York; and "Tincture of Larkspur," by Otto Raubenheimer, of Brooklyn.

Considerable discussion attended the presentation of these papers, in which Messrs. Anderson, Weinstein, Todd, Boetzel, Butler, Muir, and Wall joined with the authors. There was much appreciation of the contributions and a general concurrence in the opinions of the authors. Messrs. Raubenheimer and Kahn, however, indulged in a verbal passage at arms with reference to some portions of the latter's paper. The chief difference of opinion was concerned with the toxicity of carbon tetrachloride and the anesthetic property of its vapor, to which reference had been made by Prof. Kahn. Mr. Raubenheimer contended that these characteristics were greatly exaggerated in the literature and that his practical experience with the substance had led him to consider it quite harmless in either way. [This statement does not seem to be borne out by recently reported facts.—Editor THE DRUGGISTS CIRCULAR.]

Mr. Muir brought up for consideration a communication from the Italian Pharmaceutical Society of the State of New York, in which were embodied some suggestions for the amendment of the pharmacy law designed to admit physicians to examination for registration as pharmacists by virtue of their being licensed to practice medicine, and to place more stringent restrictions about the dispensing of drugs by physicians. Action on this communication was at the time deferred, and the matter was subsequently disposed of temporarily by referring it to the committee on the president's address.

Adjournment followed at 6:15 o'clock.

Third Session, Wednesday Forenoon.

When the routine of the sitting, convened at 9:40 o'clock Wednesday morning had been carried through, the reading of papers was taken up. Chairman Tuthill, of the committee on pharmacy and queries, read a paper by Dr. J. L. Mayer, of New York, on "The Hot-Plate as a Handy Drug Store Apparatus," and one by Dr. C. P. Wimmer, of New York, entitled "Little Sins at the Prescription Counter." Both of these were received for publication in the official Proceedings. They appear in full on page 347 of this issue.

One of the new committees reported next, the committee on the revision of the United States Pharmacopoeia. This report, which was presented by Dr. G. C. Diekmann, of New York, will be considered in a subsequent issue of the CIRCULAR.

In discussing this report, Mr. Raubenheimer expressed the opinion that patented products should not be recognized in the Pharmacopoeia; that "type processes" should be adopted; that heroic doses should be stated; and that

a standard for medicine droppers should be adopted. The report was referred in the usual order.

At this time an impromptu discussion of legislative matters was aroused and a short recess was taken to protest to the State lawmakers against the passage of the Turley bill.

Reports were presented by delegates who had represented the association at the latest meetings of the National Wholesale Druggists' Association, the New Jersey Pharmaceutical Association, and the National Association of Retail Druggists. The report on the meeting of the N. A. R. D. was read by Dr. Muir, and as it contained several recommendations anent the policy of the association with regard to the national body it was referred to a special committee consisting of Thomas Stoddart, of Buffalo; William Muench, of Syracuse; and C. O. Bigelow, of New York.

The chairman appointed A. S. Wardle, of Hudson; Peter Diamond, of New York; and George Reimann, of Buffalo, to constitute the committee on time and place of the 1912 meeting.

SELECTION OF NOMINEES FOR THE BOARD OF PHARMACY.

As provided in the pharmacy law the association proceeded to select nine qualified persons to be nominated to the regents as the association's choice from among whom might be chosen successors to the three members of the board of pharmacy whose terms expire this year. C. B. Sears, F. P. Tuthill, and C. A. Diefs were named as tellers; and, after a brief discussion, it was deemed advisable to select six nominees from New York city first, and then three from the rest of the State. No contest occurred during the selection and the following were nominated by a unanimous voice: William Muir, Otto Raubenheimer, and W. C. Anderson, all of Brooklyn; Peter Diamond, J. L. Lascoff, and J. R. Wall, all of New York; John Hurley, of Little Falls; A. S. Wardle, of Hudson; and W. B. Bissell, of Syracuse. Messrs. Raubenheimer, Lascoff and Hurley are the members whose terms expire August 1st. The secretary was instructed to forward the names of the nominees at once to the regents. [The regents' selections are noted on page 384.]

Hereupon arose another discussion of the Turley bill, occasioned by the receipt of a telegram that the measure had been unanimously approved by the State assembly. The outcome was the dispatch of messages from the organization and individuals expressing to the State senators strong opposition to the enactment of the bill.

This sitting adjourned at 12:40 o'clock.

Fourth Session, Wednesday Afternoon.

At 2:50 P. M. the convention again assembled, considering, as the first order of business, the report of the committee on new remedies. This was presented by George Reimann, of Buffalo. The report, a lengthy one, was not read in full, the presenter limiting himself to the portion referring to a hay-fever serum being experimented with in Europe. The report took the usual course.

The report of the committee on credentials was then read by C. A. Diefs, of Buffalo. Fifty-six delegates representing seventeen organizations had presented credentials and a number of these delegates extended greetings to the association. In the message of the delegates from the New York branch of the American Pharmaceutical Association, which was made by Hugh Craig, of New York, the association was asked to further legislation that would require methyl alcohol to be labeled with a name that would differentiate packages of that spirit from those containing ethyl alcohol. This request was referred to the committee on the president's address.

For the committee on commercial interests W. B. Bissell, of Syracuse, reported as follows:

REPORT OF THE COMMITTEE ON COMMERCIAL INTERESTS.

Submitting the report of your committee on commercial interests, we beg to state that early in the year, personal letters were sent to twenty-five druggists in different sections of the State, asking for contributions of short papers, embodying their views of trade conditions in their locality, and the effect of chain drug stores on their own and their neighbors' prosperity or perplexity. So many failed even to reply that the outlook was disheartening, but at last a few, always loyal and dependable members came to the rescue with some seasonable, sensible remarks which we beg to commend to your earnest attention.

In our own central section, Syracuse, we have had chain-store invasion, and severe cutting, which has continued for two years, but we have as yet no sheriff's notices to report. Cutting has extended to all manufacturers' goods, even those like Miles' and Colgate's, which were supposed to be price protected.

A good many pharmacists as well as the general public are awakening to the fact that a man who is skillfully and carefully dispensing drugs and chemicals of high potency, is as worthy of skilled remuneration as a plumber or a piano-tuner. We also believe the time is fast approaching when there will be discrimination by the physician and the public he reaches, between the stores which accurately prepare and dispense the best class of pharmaceuticals, and those which sell cut-rate "patents," pancakes, umbrellas, and cream puffs.

I have the honor respectfully to submit the following papers: "The Value of Side Lines in a Suburban Pharmacy," by DeLancy Bartlett, of Fayetteville; "The Competition of the Chain Store," by C. A. Diefs, Sr., of Buffalo; and "A Pot-Pourri of Random Thoughts on Commercial Topics," by Judson B. Todd, of Ithaca, N. Y.

Mr. Diefs read his paper, which was an optimistic view of the possibilities awaiting the individual druggist who will strengthen the personal equation in his business conduct, and a statement of a belief that men still rank above methods in influencing drug store success. A lengthy and very interesting discussion followed Mr. Diefs' expression of his opinions. Mr. Diamond thought that the chain-of-stores movement would necessitate militant action on the part of the individual drug-store keepers. Dr. Weinstein, citing conditions in New York city, was rather pessimistic in his view of the situation. Mr. Wall did not agree that professionalism would save the individual. He also recounted some experiences in "chain" stores. Mr. Bissell said he had found that the physicians and more influential portion of the public did not support "chain" stores. He thought that indolence had much to do with many failures. Dr. Muir was rather inclined to rate highly the detrimental influence of the chain store, and to view pessimistically the ultimate fate of the individual druggist. Mr. Stoddart considered the "chain" store to be a stimulant rather than a depressant to the retail druggist, and placed a high value on personality. Mr. Guilford contended that the tendency to fly too high at the start wrecked many projected drug businesses. He said that opportunities in drugdom were never so plentiful, if the druggist will but apply himself strictly and earnestly to business. Dr. Anderson argued that such competition as the "chain" stores represented did not apply to any extent to the real pharmacy of the drug business and therefore the individual druggist's effort should be to expand this part of his trade, praising propagandic work as a very helpful undertaking in this connection.

Several other members joined in commenting upon Mr. Diefs' paper which was received in the usual order.

Just prior to adjournment, which occurred shortly after five o'clock, an appropriation of \$50 was made to the Hallberg memorial fund.

Fifth Session, Thursday Afternoon.

Immediately after routine matters had been disposed of at the opening of the next sitting at 9:50 A. M., Thursday, Dr. Joseph Weinstein, of New York, read the following report of the committee on adulteration, the chairman, Dr. G. A. Ferguson, being absent:

REPORT OF COMMITTEE ON ADULTERATIONS.

Your committee has been at a loss to a certain degree in selecting a field for its investigations that would be productive of results not only interesting to the members of the association, but also instructive from that standpoint which we assume to look up to, to guide us in maintaining a standard which to-day is law.

Such examinations as have been undertaken have been made upon articles and preparations with which we are all familiar and while in some cases the results obtained are surprising, yet in the main we can surely report an excellent condition.

Your chairman has made no effort to influence in any way the work of the other members of the committee, feeling that they realized, as well as he, existing conditions and were fully capable of selecting their own paths to work along and of bringing out data that would be representative of the true state of affairs.

The report, while not voluminous in words, represents in the whole the examination of a large number of specimens and the devotion of considerable time to the work.

The data submitted by Dr. Joseph Weinstein is of extreme interest, and is given herewith in a condensed form. He selected ten articles and the field he worked in, without doubt, shows the thought he has given the matter as well as an intimate knowledge of good and bad.

Five samples of gallic acid were collected and examined. Three conformed to the standard and two contained tannin.

Four samples of adeps lanæ; three were standard and one contained over 40 per cent. of water.

Aqua ammoniæ fortior, five samples, all of which ranged from 10 to 25 per cent. of gaseous ammonia, none reaching the standard of the Pharmacopœia.

Pancreatin, four samples, two of which failed to come up to the U. S. P. test.

Spiritus ammoniæ, fifteen samples were collected—in three stores sale was refused—eleven were spiritus ammoniæ aromaticus, and four, aqua ammoniæ.

Tincture vanillæ, five samples; two made from vanillin.

Alcohol, twelve samples; eight contained wood alcohol. Some

of these specimens were labeled "acetone alcohol," and others "columbian spirits."

Prescriptions of ichthyol and water, two ounces of each, six samples; three of which were deficient in ichthyol.

Emulsion asafetida, six samples; two appeared to consist of water with just sufficient asafetida to make a milky mixture. Serum praeeparatum, six samples, two of which consisted of mixtures of lard and wax.

In submitting the findings of Dr. Weinstein, the chairman wishes to extend to him his thanks for the interest he has taken in the work of the committee, for the time he has devoted to this work and for his foresight in selection of material.

Your chairman has devoted his researches almost exclusively to the examination of crude and powdered drugs, feeling that the members of the association would consider it of vital importance to possess definite knowledge of the reliability of articles which are the basis of so many of the preparations official in the Pharmacopoeia.

The results of these examinations which are given below will speak for themselves, and will demonstrate in a rather conclusive manner if the retailer to-day is being held up by the other fellow selling him his inferior and adulterated drugs.

The chairman has been tempted to incorporate in his report the results of his labors as chemist to the State board of pharmacy; the results he has obtained in the analysis of hundreds of samples purchased from the retailers; but inasmuch as said board makes its report to the State association, he feels that any such incorporation in the committee report is unnecessary.

The matter of the U. S. P. standard for gum asafetida has often been discussed in the journals and scientific meetings, and for this reason more time was devoted to this article than to any other one. Twenty-three specimens were examined, seven for percentage of ash and alcohol-soluble matter, and sixteen for alcohol-soluble matter alone. The highest ash content obtained was 37.32 per cent. and the lowest 19.60 per cent., with an average for the seven specimens of 27.10 per cent. U. S. P. standard is not more than 15 per cent. The highest alcohol-soluble content was 76.15 per cent.; the lowest, 38.30 per cent.; with an average for twenty-three specimens of 53.22 per cent. U. S. P. standard, "not less than 50 per cent."

Hydrastis, twelve samples: Hydrastine, lowest, 2.51 per cent.; highest, 3.21 per cent. U. S. P. standard, "not less than 2.5 per cent."

Aconite root, two samples: Aconitine, lowest, 0.512 per cent.; highest, 0.540 per cent. U. S. P. standard, "not less than 0.50 per cent."

Colchicum seed, four samples: Colchicine, lowest, 0.482 per cent.; highest, 0.602 per cent. U. S. P. standard, not less than 0.45 per cent."

Colchicum corm, three samples: Colchicine, lowest, 0.334 per cent.; highest, 0.349 per cent. U. S. P. standard, "not less than 0.35 per cent."

Pilocarpus, one sample: Alkaloids, 0.676 per cent. U. S. P. standard, "not less than 0.50 per cent."

Jalap root, two samples: Total resin, lowest, 6.51 per cent.; highest, 10.06 per cent.; resin soluble in ether, lowest, 1.26 per cent.; highest, 1.32 per cent. U. S. P. standard, "not less than 7 per cent. of total resin, of which not more than 15 per cent. should be soluble in ether."

Gum benzoin, three samples: Ash, 1.55 per cent., 2.10 per cent., 2.13 per cent.; alcohol-insoluble matter, trace, 21.60 per cent., 33.67 per cent. U. S. P. standard, "almost wholly soluble in five parts of warm alcohol," and "not more than 2 per cent. of ash."

Ipecac root, ten samples: Alkaloids, lowest, 1.73 per cent.; highest, 2.23 per cent. U. S. P. standard, "not less than 1.75 per cent."

Gum guaiac, three samples: Ash, 2.21 per cent., 2.42 per cent., 0.20 per cent.; acid number, 72.46, 79.03, 73.46; alcohol-insoluble matter, 8.70 per cent., 16.39 per cent., 0.34 per cent. U. S. P. standard, ash, "not more than 4 per cent."; acid number, "not less than 70 nor more than 80"; alcohol-insoluble matter, "not more than 15 per cent."

Cinchona bark, red, one sample: Total alkaloids, 6.228 per cent. U. S. P. standard, "at least 5 per cent."

Cinchona bark, yellow, two samples: Total alkaloids, 6.23 per cent., 5.40 per cent. U. S. P. standard, "at least 5 per cent."

Scopola root, one sample: Mydriatic alkaloids, 0.4592 per cent. U. S. P. standard, "not less than 0.5 per cent."

Belladonna root, one sample: Mydriatic alkaloids, 0.5510 per cent. U. S. P. standard, "not less than 0.5 per cent."

Belladonna leaves, three samples: Mydriatic alkaloids, 0.229 per cent., 0.304 per cent., 0.602 per cent. U. S. P. standard, "not less than 0.30 per cent."

Henbane, two samples: Mydriatic alkaloids, 0.091 per cent., 0.075 per cent. U. S. P. standard, "not less than 0.08 per cent."

Stramonium, one sample: Mydriatic alkaloids, 0.821 per cent. U. S. P. standard, "not less than 0.25 per cent."

Opium, granulated, one sample: Morphine, 12.002 per cent. U. S. P. standard, "not less than 12 per cent. nor more than 12.5 per cent."

This report was received in due order, comment being made by Dr. Rusby, Mr. Raubenheimer and Prof. Kahn. Dr. Rusby brought out some of the reasons for the unsatisfactory reports heard concerning preparations of asafetida. The other two commenters chiefly condemned the use of wood alcohol in medicines whether for internal or external use.

SCHOLARSHIPS.

A. S. Wardle, of the committee on free competitive scholarships, presented a report in which was outlined the plan under which the scholarships offered by the association were awarded. This plan based the rating of applicants upon their educational qualifications, personal character, and experience. It was announced that in the next year

the committee would award four scholarships, two at the Albany College of Pharmacy, and one each at the Brooklyn College of Pharmacy and the College of Pharmacy of the City of New York.

The report was duly received, and some discussion ensued as to the relative advantages of first-year and second-year scholarships, the contentions being rather evenly matched.

Dr. W. C. Anderson, of Brooklyn, presented the following report for the committee on U. S. P. and N. F. propaganda:

REPORT OF PROPAGANDA COMMITTEE.

The services of your committee on U. S. P. and N. F. propaganda have been at the disposal of the members of the association during the past year, but, notwithstanding our general notification to that effect and urgent appeal for activity in particular instances, few opportunities have been given for advancing this most important and valuable work on the lines approved by this association.

Our chairman's connection with the Kings County Pharmaceutical Society has enabled him to assist that organization in carrying on the most aggressive and beneficial campaign of the State or even the nation. The joint meetings between physicians and pharmacists inaugurated by this society some years ago and continued from year to year, have been augmented by the employment of a representative who makes regular calls upon physicians and directs their attention to the advantages of prescribing U. S. P. and N. F. drugs and preparations, at the same time leaving with each physician samples of seasonable U. S. P. and N. F. preparations of the pharmacist's own manufacture. A new feature that has been installed during the past year by this society is the distribution to the members of the society of postal cards upon which are printed the formulas for a number of U. S. P. and N. F. preparations and a statement of some particular points concerning the same. A new supply of cards with different formulas and statements is provided each month and the members in turn mail these cards to the physicians in their section of the city. This provides about as complete a system of propaganda work as it seems possible to devise, for by it every physician must be reached sooner or later, some once, some twice and most of them many times.

PROPAGANDA MEETINGS ATTENDED.

As the representative of the New York State Pharmaceutical Association the chairman of this committee attended and took part in a most enthusiastic and largely attended propaganda meeting of physicians and pharmacists of Richmond County that was held at West New Brighton, N. Y., in May. This meeting was called at the request of the Richmond County Medical Society and developed an intensely interesting discussion and produced valuable and we trust lasting results. The physicians passed strong resolutions calling upon their constituents to desist, as far as possible, from dispensing their own remedies, and recommending due consideration for ethical prescribing and the general use of U. S. P. and N. F. drugs and preparations; and it was decided that a committee representing the physicians and one representing the pharmacists should confer and formulate plans for a more general recognition of the rights and privileges of each and more cordial relations between the representatives of the two professions.

Your committee was also represented at the joint meeting of physicians and pharmacists that was held at the Academy of Medicine, New York city, May 25th, 1911, and by special invitation at one of the largest propaganda meetings ever held, which took place at Cincinnati, Ohio, early in January.

Other propaganda meetings of which your committee has no knowledge may have been held in this State during the year, but we believe it will be conceded that even with every meeting accounted for and all the work recorded, a lack of proper recognition of the importance of the propaganda movement has been shown. A general survey of the propaganda spirit throughout the State shows only passing concern and irregular spasmodic action in reference to a matter which if considered in all its relations to the practice of pharmacy must impress every thoughtful pharmacist with its vital importance and value.

PROFESSIONAL AND COMMERCIAL PHARMACY.

No one will deny the fact that the practice of pharmacy embraces both professional and commercial activities, but only those who have lost all regard and consideration for the position and honor of their chosen occupation and have buried their dignity and pride under an avalanche of commercial ideas and practices will attempt to contend that professional pharmacy should be sacrificed in order that more time may be given to the development of profit producing commercialism.

The recognition given the pharmacist and the position he shall occupy must necessarily depend upon the conditions which exist in the practice of pharmacy. If that practice is entirely commercial he must be content with the position of the ordinary tradesman, for, while he may have the training, education, and ability that will enable him to occupy a more exalted position, the world judges men by what they do rather than what they are capable of doing. If, however, those professional activities which always have been and always should be maintained in the practice of pharmacy shall continue to be an important part of the daily work of the pharmacist, the position given him as a professional man and recognition accorded him because of his ability and importance will ever be secure.

EFFECT OF PROPAGANDA WORK ON PROFESSIONAL PHARMACY.

It was for the purpose of maintaining these professional activities in the practice of pharmacy and securing for the physician, the pharmacist and the public, the splendid benefits that must accrue therefrom, that the U. S. P. and N. F. propaganda work was inaugurated.

It is generally conceded that the true professional practice of pharmacy must be to a very great extent what the physician makes it. Propaganda work fosters greater interest on the part of the physician, overcomes prejudice and lack of confidence that is often caused by misrepresentations, shows the true value of U. S. P. and N. F. drugs and preparations and causes the physician to be most considerate of his method of prescribing and particular about the remedies he prescribes.

Differences and misunderstandings between physicians and pharmacists sometimes exist and operate to the disadvantage of each. Propaganda work rectifies these differences, corrects the misunderstandings and cultivates confidence and more cordial relations. In fact, propaganda work is the most potent factor to-day in securing necessary, worthy and lasting benefits for professional pharmacy. It is the only available means by which we can effectively check the inroads that are being made into our professional practices and secure for pharmacy that consideration, recognition and support to which it is justly entitled.

It is a line of work that is free from objectionable features, benefits alike the large business and the small business, the city pharmacist and the country pharmacist, and should receive the true enthusiastic support of all.

APPEAL FOR MORE PROPAGANDA MEETINGS.

We earnestly appeal to every pharmacist in the State to make it his personal business to see that one or more propaganda meetings are held in his city or town during the coming year.

There is great danger in drifting with a tide that is carrying one upon a barren shore or destructive rocks, and, as we cannot fail to recognize the fact that recent tides have not been carrying our pharmaceutical ship in safe directions, each will fail in his solemn duty if he does not aid in stemming this tide by assisting in pressing forward the powerful and effective propaganda wave.

The time is ripe, physicians are in a most receptive mood and New York State with a State pharmaceutical association having a most enviable record for splendid achievements in pharmaceutical affairs should take and maintain the lead in a work that means so much to all.

Dr. Anderson also explained some of the details of the work in Kings county. C. H. Lehmann recounted the experiences of the Richmond county druggists in this work, and Messrs. Schlesinger and Wiesendanger told of the propagandic movement in Westchester county.

The report was received in the regular manner.

TRAVELER'S AUXILIARY.

A visit by the Commercial Travelers' Auxiliary occurred at this time. W. R. Jackson acted as spokesman for the visitors and suggested that the next meeting be held at Rochester in the belief that the association would be the gainer numerically and otherwise.

He also introduced the following newly elected officers of the C. T. A.: President, C. P. Dickson; vice-president, D. M. Woodard; secretary and treasurer, R. W. Du Puy; executive committee, H. R. Stearns, C. W. Coleman and C. F. Kelly; entertainment committee, L. E. Treat, W. R. Jackson and W. F. Whalen.

Peter Diamond, of New York, welcomed the delegation and invited all traveling men to join the N. Y. S. P. A. And the visitors were formally thanked for the assistance they had given to the association.

N. A. R. D. MATTERS.

Thomas Stoddard, of Buffalo, presented a report by the committee considering the report of the delegates to the 1910 convention of the National Association of Retail Druggists. The national body was commended for its work for co-operation between doctors and druggists; re-affiliation under the existing plan was recommended; the N. A. R. D., it was urged, should become more active in legislative matters, using expert assistance and endeavor to get the strongest committee on legislation.

In the discussion of these recommendations it transpired that the present plans of the N. A. R. D. would tend to secure the results desired by the committee. H. B. Guilford, of Rochester, president of the N. A. R. D., set forth at length the projects of the organization. The report of the committee was duly received, with the approval of the recommendations.

At this juncture Dr. Muir suggested that the expenses of the three delegates of the N. Y. S. P. A. to the N. A. R. D. meetings be paid—the present plan is to pay the expenses of the chairman alone. After a great deal of discussion the suggestion was withdrawn.

Mr. Wardle then reported for the committee on time and place of the 1912 meeting, favoring Sacandaga Park. Dr. Muir favored this suggestion, but Messrs. Wiesendanger and Guilford urged the selection of Rochester. The committee's report was approved.

For the committee on the president's address Prof. Anderson presented the following report to which very little objection was made and which was adopted:

DECLARATION OF POLICY.

The address of the president, the report of the legislative committee and various resolutions that were referred to our committee have been carefully considered and we recommend the adoption of the following:

Resolved: That this association approves the sentiment expressed in the address of the president in relation to the State board of pharmacy, yellow journalism, legislative work, the committees, the National Association of Retail Druggists, the Commercial Travelers' Auxiliary, and the press.

Resolved: That this association hereby reaffirms its declaration that local associations throughout the State should not introduce bills in the legislature affecting the practice of pharmacy without first submitting the same for consideration by this association or its legislative committee.

Resolved: That the secretary be instructed to send a letter to each pharmacist of the State who is not a member of this association, which shall contain a statement of the legislative measures that have been introduced during the past year, the effect their enactment would have upon his business, and the action of this association upon the same, at the same time soliciting his application for membership.

Resolved: That in addition to encouraging the splendid work being done by the Commercial Travelers' Auxiliary in securing new members for the association, the executive committee be directed to secure the services of a canvasser or canvassers to secure new members for this association at such a rate of compensation as that committee shall determine.

Resolved: That a letter expressing the appreciation of this association for services rendered, be sent to each of the following assemblymen: Edward Merritt, of St. Lawrence; F. W. Hammon, of Syracuse; O. S. Beach, of Tigua county; H. E. Allen, of Oneida county; and Charles Brown, of Cortland; Senator T. Harvey Ferris, of Utica.

Resolved: That this association heartily endorse the action of the legislative committee upon the various bills affecting pharmacy, whether national, State or local, that have been pending during the past year.

Resolved: That our legislative committee take such steps as may be necessary to have the term "Wood Naphtha" apply to the drug now commonly known as "Wood Alcohol."

Whereas, many people commit suicide or homicide through the use of poisons, and official attention having been drawn to this, legislation for the restriction of their sale is proposed, directed especially against branches of the drug trade, and

Whereas, most poisonous substances so employed, are either disinfectants or chemicals used in the arts, and sold in other lines of business, where it would be impossible to comply with methods of sale affording effective control of such articles, and

Whereas, the real trouble is the fact that the name of the poison, and as far as possible, the dose employed, as well as fairly accurate information as to the proper dose to employ, is usually printed in the newspapers, inducing morbid people and criminals to use these poisons, through reading such statements, therefore be it

Resolved: That the members of the New York State Pharmaceutical Association urge upon the coroners and other officials of their State, and especially upon the proprietors of all newspapers published within the State, the importance of refraining from furnishing to the public the name of the poison used in any case of suicide or homicide by poison, and especially giving instructions regarding the method of using such poisons, and the amount constituting a fatal dose.

It is unfortunate that so many of the assay processes of the present Pharmacopoeia on drugs are open to criticism and that concordant results can only be obtained by long experience in this particular field of work. Criticism that is specific has already been brought before the respective committees having this phase of the work in hand, and without doubt the next Pharmacopoeia will be more of an open book to those who are comparatively beginners in drug assay, and methods will be given that can more easily be followed with accurate results.

Your committee respectfully submits this report for your consideration and approval, appreciating that it deviates to some degree from other reports in past years, but as members of said committee we feel that the data incorporated is material in many respects.

The committee's action in disapproving the suggestions for the amendment of the pharmacy law which had been made by the Italian Pharmaceutical Association of the State of New York, was concurred in by the convention. The Italian organization, however, was assured that the State association would assist in an endeavor to correct the dispensary evils against which the amendment was aimed.

The sitting then adjourned for two minutes.

Sixth Session, Thursday Afternoon.

When the meeting was again convened Dr. Rusby read by title a paper on "Suggestions for Governmental Rectification of Unfit Drugs before Admission"; and the paper was referred for publication.

The consideration of the Turley bill was made a special order of business for the evening's sitting.

The election of officers followed, the results being as stated on page 385. No opposition was encountered by any of the nominees.

Adjournment was taken at 1:20 o'clock.

Final Session, Thursday Evening.

At six o'clock, Thursday evening, the convention took up the discussion of the Turley bill as passed unanimously by the State assembly. The bill was read by the secretary

and characterized by Dr. Muir as still unsatisfactory. There was not much discussion. Everybody seemingly was agreed that the measure was not a satisfactory one, a fair one, or a potent one. Several suggestions were made with a view to enlisting the aid of the medical societies in opposition to the bill, and the effectiveness of getting political aid in defeating the measure was pointed out.

The result was the instructing of the legislative committee to oppose the bill in the senate and before the governor. The members were also urged to use their individual influence against the bill.

C. B. Sears, for the committee on pharmacy and queries, read by title the following papers: "The Misuse of Wood Alcohol," by Otto Raubenheimer, of Brooklyn; and "Ideals," by L. Marmor, of New York. The papers were referred for publication.

Unanimous approval was given to a motion by Prof. Anderson to set aside the resolution adopted at the 1910 convention, which was in effect that no member of the board of pharmacy should be appointed as a member of the association's legislative committee.

The new officers were then installed, Messrs. Weygant and Stoddart acting as ushers; and the convention was adjourned at 7:55 P. M.

The Entertainment.

Although its plans several times went a-gley, the local committee, with the assistance of the Commercial Travelers' Auxiliary, furnished a series of entertainments that were quite satisfactory. There were boat rides galore, card parties, dancing, drawings for prizes, and, of course, the enjoyable reception by the president.

Greatest of all amusements was the game of baseball (?) between teams representing the association and the auxiliary. The pill-pounding "Athletics" pounded the leather-coated bolus "so carefulee and completelee" that they piled up 29 tallies while the traveler "Cubs" were scraping up 8. Sure 'twas lack of practice—wait 'til next year.

Many fishing parties were daily employed in luring the finny monsters of the St. Lawrence. Some good strings were brought in.

Instruction, as well as entertainment, was found in the display of wild medicinal plants of the Alexandria Bay region, some thirty specimens having been collected and arranged by Prof. William Mansfield and Hugh Craig.

News of Other State Associations.

July Meetings of Associations.

MINNESOTA, 11th to 13th, at Duluth.
NORTH CAROLINA, 12th to 14th, at Greensboro.
OHIO, 11th to 14th, at Cedar Point.
OREGON, 12th to 14th, at Seaside.
SOUTH CAROLINA, 5th and 6th, at Chick Springs.
TENNESSEE, 11th and 12th, at Nashville.
VIRGINIA, 11th to 14th, at Roanoke.
WEST VIRGINIA, 18th to 20th, at Webster Springs.

California Association.

Stirring times obtained during the fifth annual meeting of the California Pharmaceutical Association which occurred at Sacramento, May 16th to 19th. Education and legislation were the rocks upon which the attendants split, and the result was the prevailing of the conservative spirit.

The discussion centered about the report on the conference of the California Board of Pharmacy and a committee from the association, which had to do with changes in the pharmacy law. Two reports were offered. The majority report was read by J. H. Flint, and J. G. Munson reported for the minority. The majority represented those who were opposed to requiring that candidates for registration in pharmacy be graduates of pharmaceutical schools and the recognition of diplomas in lieu of examination. The majority report was adopted, and the question of changes in the law was left to a committee.

A special committee was provided to consider ways and means of publishing the Proceedings of the association.

The papers and addresses were many as the following list shows: "Pharmacy as a Profession," by Albert Schneider; "The Pharmaceutical Laboratory," by F. W. Nish; "Conservation as Applied to Pharmacy," by G. H. P. Lichhardt; "The Standing of the Pharmacist," by R. A.

Leet; "Drug Store Management," by J. A. Sanford; "State Laws Governing Pharmacy," by J. G. Munson; "A New Pharmacy Law," by A. L. Leber; "Women in Pharmacy," by Mrs. J. B. Winslow; "U. S. P. and N. F. Propaganda," by H. G. Dean; "Veterinary Sera and Pharmacy," by C. M. Twining; "Boosting the Prescription Business in a Residence District," by W. E. Brennan; "Relation of the Soda Fountain to the Drug Store," by A. L. Rich; "Disinfectants and Insecticides," by R. R. Rogers; "The Evolution of Pharmacy," by C. H. Ward; "Biologies," by F. I. Lachenbach; and "The Administration of the Pure Drugs Act," by M. E. Jaffa.

Eighty-nine new names were added to the roll of members who, the secretary reported, numbered 406.

Amateur theatricals, a banquet and a boat ride were the leading features of the entertainment program.

Officers were elected as follows: President, I. H. P. Lichhardt, of Sacramento; vice-presidents, J. A. Hughes, of Bakersfield; and F. F. Green, of San Francisco; secretary and treasurer, K. B. Bowerman, of San Francisco; trustees, F. B. Taylor, of Oakland; J. B. Stocker, of Sacramento; Edward Baer and L. M. Aguirre, both of San Francisco; F. N. Drake, of Los Angeles; J. A. Sanford, of Stockton; and W. S. Kimball, of Bakersfield.

Monterey was selected as the 1912 meeting place; the date will probably be in April.

Connecticut Association.

Rainy weather was responsible for the very slim attendance at the meeting of the Connecticut Pharmaceutical Association held June 13th and 14th, at Indian Neck. However there were about 200 present at the banquet on the afternoon of the second day.

Liquor laws as they affect pharmacists were the subject of considerable discussion. This resulted in the adoption of an amendment to the by-laws of the association providing that any member convicted of violating the excise law would be dropped from the roll.

Officers were elected as follows: President, H. M. Leron, of Norwich; vice-presidents, S. M. Allen, of South Norwalk; and M. F. Hope, of New Haven; secretary, A. E. Lathrop; and treasurer, K. O. Cyrus, of Bridgeport.

Delaware Society.

The twenty-fifth annual meeting of the Delaware Pharmaceutical Society was held June 1st, at Wilmington. The business transacted was largely routine; a resolution was adopted expressing opposition to the attempt to levy a stamp-tax on ready-made medicines and toilet wares.

A boat trip to Philadelphia and return was enjoyed in the afternoon and evening. Among the visitors were Dr. McFadden, from the Maryland association, and Prof. I. V. S. Stanislaus, of Philadelphia.

Officers were elected as follows: President, W. R. Keys, of Clayton; vice-presidents, Nora V. Brendle, for New Castle county; Harry McDowell, for Kent county; and P. C. Murray, for Sussex county; secretary and treasurer, J. F. Belt, of Wilmington; directors, J. T. Challenger, J. O. Bosley, J. M. Harvey, W. R. Keys, and James Chipman.

Georgia Association.

The thirty-sixth annual meeting of the Georgia Pharmaceutical Association was held at Indian Springs, June 13th and 14th.

A large number of members were in attendance and many papers were read and discussed.

Officers for the ensuing year were elected as follows: President, John Montgomery, Jr., of Thomasville; first vice-president, E. W. Johnson, of Newnan; second vice-president, J. W. Ridout, of Macon; third vice-president, Miss Strong, of Atlanta; secretary, T. A. Cheatham, of Macon; treasurer, T. B. Rice, of Greensboro.

The place for the next meeting was not decided on, the executive committee will select it.

Idaho Association.

At the fifth annual meeting of the Idaho Pharmaceutical Association held at Pocatello, May 10th to 12th, a statement was prepared for publication in which was set forth the position of the organization with reference to the enforcement of the anti-narcotic law of the State. The impression existed that by the utterances of the food and drugs officials the druggists had been put in a wrong light as to their attitude toward the efforts of the board of health to stop the illegitimate sale of narcotics, and the

statement was to the effect that druggists were not law-breakers, but were heartily in accord with the board's endeavors.

During the meeting the visitors were entertained at a banquet and ball, and the traveling salesmen defeated the druggists at baseball. There were other athletic competitions for prizes.

Officers were elected as follows: President, J. J. Beuhler, of Pocatello; vice-presidents, W. H. Anderson, of Soda Springs; and Clyde Thurston, of Payette; secretary, S. S. Ferguson, of Pocatello; and treasurer, H. H. Whittlesy, of Pocatello.

Next year's meeting will be held at Boise, May 9th to 12th.

Indiana Association.

The thirtieth annual meeting of the Indiana Pharmaceutical Association was held at Indianapolis, June 13th to 15th.

Among papers read were the following: "Legislative Procedure," by J. M. Barrett; "The New Law and Some Things We Need," by W. H. Rudder; "Making and Collecting Accounts," by M. F. Doherty; "The Troubles of the Druggist and the Bright Side of the Business," by H. E. Zimmer; "Proprietor, Clerk and Customer—their Relation to Each Other," by F. D. Werner. By request Dr. J. N. Hurty re-read a paper presented at a former meeting on "The Relation of the Druggist to the Community in which he Lives."

There were general discussions on window displays and other forms of advertising.

Quite an addition to the Hallberg fund was made by members contributing individually, the association also giving twenty-five dollars.

A memorial meeting was held in honor of Leo Eliel who died during the year.

F. W. Meissner was endorsed for appointment as a member of the board of pharmacy.

Officers were elected for the ensuing year as follows:

President, T. C. Bayse, of Rockport; first vice-president, Frank Walcott, of Rushville; second vice-president, S. D. Waggoner, of Terre Haute; third vice-president, Eugene Brickley, of Anderson; secretary, Maurice P. Schwartz, of Indianapolis; treasurer, Frank H. Carter, of Indianapolis. Executive committee—E. W. Stocky, A. C. Pilkenton, and M. A. Stout.

The next meeting will be held at Terre Haute.

Illinois Association.

Rock Island was the place, and June 10th to 12th, the date, the event being the thirty-second annual meeting of the Illinois Pharmaceutical Association. The attendance was large; the good time was continuous; and, not the least, the session was replete with interest and profit.

President G. C. Lescher in his annual address dealt with the important questions of organization, trade interests, education and propaganda. He endorsed the prerequisite requirement; recommended that a strong protest be made against the imposition of a stamp tax; urged the pharmacists of the State to join the two great national organizations; and advised a more stringent enforcement of the pharmacy law to secure which will require the active co-operation of every law-abiding pharmacist.

The report of Secretary W. B. Day showed a membership of about 1100. Fifty-three new members were elected at the meeting. Treasurer G. C. Bartells reported a balance on hand in the general fund of \$969.94, and in the permanent fund of \$600.

Reports were had from the advisory board of the school of pharmacy of the University of Illinois and the committee on appropriation. It was reported that the legislature had made an appropriation to the school of \$10,000 a year for two years. A very practical and much appreciated report was that of the committee on trade interests presented by E. H. Ladish, of Chicago. Other interesting reports were by G. H. Schrbeck, on the records of the board of pharmacy; by C. H. Avery, on the Illinois Board of Pharmacy; by G. R. Mills, on U. S. P. and N. F. propaganda; and by T. H. Potts, on the National Association of Retail Druggists.

The report of the legislative committee, presented by J. H. Wells, was the most discussed feature of the meeting. Pharmacal-legal matters—those not touched upon in the report included—were considered in arguments and criticisms by F. C. Dodds, Wilhelm Bodemann, Fritz Lueder,

and J. P. Crowley. The committee's report was finally adopted.

By resolution the association disapproved the attempt to levy a stamp-tax on medicines and other proprietary preparations.

Another resolution deplored the publication by newspapers of the details of suicides by poisoning, the opinion being that this publicity was harmfully suggestive to the public.

For essays on the allotted subject, "How Can the Usefulness of Our Association to the Pharmacists of the State be Increased?" O. F. Niethammer and P. J. Forbich received prizes.

A contribution of \$50 was made to the Hallberg memorial fund.

The association renewed its affiliation with the N. A. R. D.

The association's nominees to the governor for his consideration in appointing a member of the board of pharmacy are C. A. Storer, Joseph Forbrich, J. C. Wheatcroft, H. A. Stillman, and D. D. Moore. The nominees for the position on the advisory board of the school of pharmacy are Herman Fry, L. P. Larsen, O. D. Ehrlicher, A. B. Clark, and W. C. Simpson.

The election for officers resulted in the choice of the following:

President, C. H. Achelpohl, of Quincy; vice-presidents, J. H. Wells, of Chicago; R. E. Dorland, of Decatur; and A. J. Riess, of Rock Island; secretary, W. B. Day, of Chicago; and treasurer G. C. Bartells, of Camp Point.

The entertainments were many and fine: boat trips, automobile rides, a card party, a dance, and an entertainment. Greatest of all was the interstate athletic meet with the Iowa association, which was in session at the same time across the river. There were all sorts of contests for men, women and children, the mammoth attraction being a near-baseball game that was too-much Iowa.

Springfield was selected as the 1912 meeting place.

Iowa Association.

From all over the State druggists congregated at Davenport, June 10th to 12th, attending the thirty-second annual meeting of the Iowa Pharmaceutical Association. The meeting all in all was a pleasant and fruitful one.

The annual address of President W. R. Beck was a comprehensive review of the year's pharmacal movements and achievements, particularly the work along legislative lines.

According to the report of Secretary J. M. Lindley, the members of the association number 462. And the report of the treasurer's office showed a balance on hand of \$750.

T. H. Potts, secretary of the National Association of Retail Druggists, was one of the chief speakers. He set forth the advantages secured by the N. A. R. D.; urged co-operation of druggists and doctors; condemned dispensing by physicians, and denounced cut prices.

W. H. Torbert, of Dubuque, rapped the nostrum evil as an address.

Legislation was given a deal of attention in the discussion. A suggestion that the members be taxed for the purpose of having a representative to look after the druggists' interests during the legislative sessions was not approved.

Trolley, automobile and boat trips were provided for the visitors. Also were there a smoker, a dance, and a day of athletics with the Illinois association.

Officers were elected as follows: President, N. F. Reed, of Ottumwa; vice-presidents, William Lage, of Davenport; Daniel Haas, of Dubuque; and A. J. Kilmer, of Mason City; secretary, Albert Falkenhaimer, of Algona; treasurer, J. M. Lindly, of Winfield; executive committee, Frank Shane, of Eldon; Milo Johns, of Clinton; and George Petersen, of Storm Lake.

Sioux City won on the vote for next year's meeting place.

Kansas Association.

The reading of a number of excellent papers and considerable lively discussion were features of the thirty-second annual meeting of the Kansas Pharmaceutical Association held at Topeka, May 23d to 25th. A more than usually large number of persons were in attendance, and the liveliest interest prevailed.

In the discussion of legislative matters the arguments were quite warm at times. A plan was formulated for more effective co-operation among the members in legislative considerations.

An appropriation of \$40 was made to the Hallberg memorial fund.

Strenuous work on the part of the travelers' auxiliary had secured eighty-nine new members who were elected during the meeting.

Officers were elected as follows: President, Harry Dick, of Lawrence; vice-president, C. C. Reed, of Salina; secretary, David von Riesen, of Marysville; and treasurer, W. J. Bangs, of Madison.

The 1912 meeting will be held May 21st to 23d, at Atchison.

Michigan Association.

One of the most striking events at the 1911 meeting of the Michigan Pharmaceutical Association was the concurrence in President E. E. Calkin's approval of the parcels-post idea. The association had at previous meetings declared its opposition to a parcels-post.

The meeting was held at Battle Creek, June 6th to 8th, and was very well attended. The discussions were very interesting, as were the papers, the following being the subjects and speakers: "The Retail Druggist and His Profits," by Harry B. Mason; "The Circulating Library," by C. A. Weaver; "New Processes for U. S. P. and N. F. Preparations," by L. A. Seltzer; "N. F. and U. S. Propaganda," by W. A. Hall; "Selling Your Own Toilet Preparations," by E. E. Calkins.

Under the auspices of the travelers' auxiliary an enjoyable series of entertainments was carried out.

Officers were elected as follows: President, E. W. Austin, of Midland; vice-presidents, E. C. Varnum, of Jonesville; C. P. Baker, of Battle Creek; and J. P. Lipp, of Blissfield; secretary, M. H. Goodale, of Battle Creek; treasurer, J. J. Wells, of Athens; executive committee, E. J. Rogers, of Port Huron; L. A. Seltzer, of Detroit; S. C. Bull, of Hillsdale; and H. G. Spring, of Unionville; and trustee of the memorial scholarship fund, C. F. Mann, of Detroit.

Missouri Association.

The thirty-third annual meeting of the Missouri Pharmaceutical Association was held at Cape Girardeau, June 13th to 16th. This was the first time the association has met in the southeastern portion of the State. The attendance was above the average and the meeting a success. The local pharmacists and other business men gave the association a complimentary trip on a palatial Mississippi River steamboat from St. Louis to Cape Girardeau. This was a novel and much appreciated feature of the 1911 meeting.

The increase in membership was a record-breaker, the list reaching 166. H. W. Servant, of the board of pharmacy, added 101 of these names.

The following papers were read: "The Status of Pharmacy in our State during my Professional Career," by Francis Hemm. "An Ancient Guild of Grocer-Apothecaries," by Leo R. Suppan. "An Egyptian Glass Bottle," by J. F. Llewellyn. "Joplin Scintillations," by the committee on papers and queries. "Price Protection," by H. O. A. Huegel. "The Qualifications of Members of State Boards of Pharmacy," by Leo R. Suppan. "The Missouri Pharmaceutical Association Meeting of 1886," by H. M. Whelpley. "The Hospital Drug Store," by the committee on papers and queries. "Soda Fountain Fruits," by L. Lieberstein. "An Uncommon Prescription," by Mrs. M. M. Whitney. "The Preparation of Salvarsan Solutions," by Wm. K. Ilhardt. "Greek Folk Medicine," by J. F. Llewellyn.

The board of pharmacy came in for much discussion and a resolution was passed urging the board to add a practical examination feature to its tests for registration as soon as possible or practicable. The term of Charles Gietner as a member of the board expiring July 1st, the association nominated Otto Ude, Charles Gietner and G. H. J. Andreas, all of St. Louis, as candidates for the vacancy. Mr. Gietner is a Democrat and has served six years on the board. There is much speculation as to whether the Republican governor will reappoint Mr. Gietner and thus establish a bi-partisan board for the first time in the State.

Treasurer Mittelbach reported a balance of \$200.54 on hand and a net enrollment of 572 members.

Secretary H. M. Whelpley reported the distribution of 1000 copies of the 1910 Proceedings. He stated that the James H. Beal Endowment Fund amounts to \$102 and is drawing 4 per cent. interest compounded semi-annually.

The secretary's recommendation that property of historic interest be turned over to the A. Ph. A. historian or the Lloyd Library was approved.

The officers elected for the ensuing year are: President, I. Ben Miller, of Cape Girardeau; first vice-president, H. O. A. Huegel, of St. Louis; second vice-president, Jesse E. Koppenbrink, of Higginsville; third vice-president, J. A. Hummel, of New Madrid; treasurer, William Mittelbach, of Boonville; permanent secretary, H. M. Whelpley, of St. Louis; assistant secretary, Louis Lieberstein, of St. Louis. Council—Walter C. Bender, Samuel Farrar, Otto F. Claus, D. V. Whitney, and Leo Suppan. The president, permanent secretary and treasurer are ex officio members of the council.

The 1912 meeting will be held at Pertle Springs (Warrensburg), where the association has met eleven times, provided the committee on place of meeting can complete satisfactory arrangements with the proprietors of this popular summer resort.

The association voted \$50 to the N. A. R. D. and \$25 to the Hallberg memorial fund.

Nebraska Association.

The Nebraska Pharmaceutical Association held the thirtieth annual meeting at Fairbury, June 13th to 15th. The attendance was good and seventy-one names were added to the membership roll. Among the questions discussed was early closing; the majority favoring closing about 7 p. m.

Lynn Thompson, of Gordon; L. W. McConnell, of McCook; and W. G. Boyer, of York, were nominated to the governor for appointment on the board of pharmacy, one to be chosen.

Officers were elected for the ensuing year as follows: President, A. V. Pease, of Fairbury; vice-presidents, R. A. Lyman, of Lincoln; O. W. Case, of Crofton; Orel Jones, of Oconto; W. Brookley, of Edgar; and D. J. Hoyer, of Wood River; treasurer, D. D. Adams, of Nehawka; and secretary, J. G. McBride, of Stella.

The next meeting will be held at Beatrice.

New Jersey Association.

The annual meeting of the New Jersey Pharmaceutical Association was held at Asbury Park, June 13th to 16th, the first day being given to a meeting of the executive committee and a reception by the president.

The executive committee reported a net membership of 755, an increase of 12 over the last report. Six hundred and fifty-two were active members; 82 associate; and 21 honorary.

Papers were read as follows: "The Fifth Revision of the German Pharmacopoeia," by Geo. M. Beringer. "Fluidextract of Echinacea," by Geo. M. Beringer. "Standard Surgical Dressings," by Fred B. Kilmer. "Headache Remedials," by Dr. P. E. Hommel. "A Liniment Window Display," by Chas. W. Holzhauser. "Powdered Bland's Mass," by G. M. Beringer, Jr. "A Review of U. S. P. and N. F. Propaganda, Particularly as Applied to Results in Modern Dispensing," by Henry Schmidt. "The N. F. Pepsin Preparations," by Dr. P. E. Hommel. "The U. S. P. Iron Preparations," by Dr. P. E. Hommel. "The Necessity for Pharmacists to Become Interested in Legislation Relating to Pharmacy," by Morris H. Albach. "The Preparation of the Neutral Suspension of Salvarsan," by Geo. M. Beringer, Jr. "Where Does the Average Druggist Get His Time?" by Charles H. LaWall. "Essence of Pepsin, N. F.," by A. F. Marquier.

The officers elected for the ensuing year are: President, William E. Warn, of Keyport; vice-president, Henry E. Wensch, of Montclair; second vice-president, John D. Case, of Somerville; secretary, Frank C. Stutzlen, of Elizabeth; treasurer, James C. Field, of Plainfield. Executive committee, Henry E. Wensch, John N. Smith, Charles Holzhauser, Garret Byrnes, and Levi J. Farley.

The next meeting will be held at Atlantic City.

Oklahoma Association.

May 17th to 19th the Oklahoma Pharmaceutical Association met at McAlester in its sixth annual session. Various matters of moment were threshed over, the cut-price evil coming in for especial condemnation by resolution.

These following are the newly elected officers: President, W. W. Holden, of Kellyville; vice-presidents, C. A. Dow, of Pond Creek; and Mrs. Fannie Schenck, of Du-

rant; secretary, W. H. McCutcheon, of Luther; and treasurer, Dollie Singletary, of Caney.

Oklahoma City was selected as the place for the 1912 meeting.

Pennsylvania Association.

The thirty-fourth annual meeting of the Pennsylvania Pharmaceutical Association was held at Bedford Springs, June 20th to 22d.

The officers elected for the ensuing year are:

President, Joseph L. Lemberger, of Lebanon; first vice-president, Louis Saalbach, of Pittsburg; second vice-president, Jacob M. Baer, of Philadelphia; secretary, Edgar F. Heffner, of Lock Haven; treasurer, Francis H. E. Gleim, of Lebanon; local secretary, Harland J. Mentzer, of Blus Ridge; executive committee, W. A. Carpenter, of Philadelphia; Henry W. Merritt, of Plains; and P. W. Snyder, of Hollidaysburg.

The new president, Joseph Lemberger, had been treasurer for thirty-three years, having been first elected at the organization meeting.

Buena Vista was chosen as the place for holding the next meeting.

Vermont Association.

The eighteenth annual meeting of the Vermont Pharmaceutical Association was held at Burlington, June 21st and 22d. The executive committee met on the 20th and Dr. Rusby lectured on his travels in South America. At the afternoon session on the 21st he made an address on the food and drugs act.

Secretary Terrill in his report made a plea for greater promptness in the payment of dues. The expenses of the association, he said, have increased faster than the membership. The increase in membership during the nine years that he had served was 116 per cent. The number of members has increased in that time from 151 to 326. During the year two members have died—Dr. M. J. Wiltse, of Burlington, and Willis V. Bryan, of Waterbury.

The following officers were elected for the ensuing year:

President, Timothy Neville, of Vergennes; first vice-president, A. B. Anderson, of Swanton; second vice-president, F. J. Kinney, of Orleans; third vice-president, Guy C. Rocheleau, of Burlington; secretary-treasurer, W. E. Terrill, of Montpelier.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

ALABAMA—October 10th, at Montgomery. E. P. Galt, Selma.

ARIZONA—November 8th, at Phenix. A. G. Hulett, Phenix.

ARKANSAS—J. F. Dowdy, Little Rock.

CALIFORNIA—July 19th, at Los Angeles; July 26th, at San Francisco. Louis Zeh, San Francisco.

CONNECTICUT—September 5th, at Hartford. J. A. Levery, Bridgeport.

COLORADO—S. L. Bresler, Denver.

DELAWARE—Albert Dougherty, Wilmington.

DISTRICT OF COLUMBIA—July 13th and 14th, at Washington. S. L. Hilton, Washington.

FLORIDA—D. W. Ramsaur, Palatka.

GEORGIA—C. D. Jordan, Monticello.

IDAHO—J. M. Starrh, Shoshone.

ILLINOIS—July 13th, at Chicago. F. C. Dodds, Springfield.

INDIANA—July 11th and 12th, at Indianapolis. W. H. Fogas, Mt. Vernon.

IOWA—August 1st, at Des Moines. E. J. Moore, Des Moines.

KANSAS—August 23d, at Winfield. W. E. Sherrieff, Ellsworth.

KENTUCKY—July 11th and 12th, at Paducah. J. W. Gayle, Frankfort.

LOUISIANA—August 4th and 5th, at New Orleans. F. A. Earhart, New Orleans.

MAINE—August 9th and 10th, at Augusta. F. W. Bucknam, Skowhegan.

MARYLAND—Ephraim Bacon, Roland Park.

MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.

MICHIGAN—E. J. Rodgers, Port Huron.

MINNESOTA—July 18th, at Minneapolis. C. T. Heller, St. Paul.

MISSISSIPPI—October 3d, at Jackson. L. H. Wilkinson, Greenwood.

MISSOURI—C. E. Zinn, Kansas City.

MONTANA—October 11th, at Great Falls. S. J. Coffee, of Missoula.

NEBRASKA—A. V. Pease, Fairbury.

NEVADA—November 1st, at Reno. R. L. Prouty, Tonöpah.

NEW HAMPSHIRE—F. H. Wingate, Nashua.

NEW JERSEY—July 20th and 21st, at Trenton. H. A. Jordan, Bridgeton.

NEW MEXICO—A. J. Fisher, Santa Fe.

NEW YORK—September 27th and 28th, at New York, Albany and Buffalo. W. L. Bradt, Albany.

NORTH CAROLINA—July 7th, at Morehead City. F. W. Hancock, Oxford.

NORTH DAKOTA—October 17th, at Fargo. W. S. Parker, Lisbon.

OHIO—F. H. Frost, Columbus.

OKLAHOMA—July 11th and 12th, at Oklahoma City. J. C. Burton, Stroud.

OREGON—F. C. Pozzi, Portland.

PENNSYLVANIA—L. L. Walton, Williamsport.

RHODE ISLAND—October 3d, at Providence. J. E. Brennan, Pawtucket.

SOUTH CAROLINA—F. M. Smith, Charleston.

SOUTH DAKOTA—July 12th, at Lead. E. C. Bent, Dell Rapids.

TENNESSEE—July 10th and 11th, at Nashville. I. B. Clark, Nashville.

TEXAS—September 19th, at Houston. R. H. Walker, Gonzales.

UTAH—July 18th and 19th, at Salt Lake City. W. H. Dayton, Salt Lake.

VERMONT—D. F. Davis, Barre.

VIRGINIA—July 25th, at Richmond. T. A. Miller, Richmond.

WASHINGTON—P. Jensen, Tacoma.

WEST VIRGINIA—A. Walker, Sutton.

WISCONSIN—Edward Williams, Madison.

WYOMING—C. B. Gunnell, Evanston.

Alabama Board.

At a meeting of the Alabama board of pharmacy held at Birmingham, May 15th, forty-seven applicants for registration were examined. The following were passed:

As pharmacists: Q. S. Adams, of Mobile; J. H. Barr, of Eufaula; Henry A. Clark, of Newbern; E. M. Davis, Jr., of Purvis, Miss.; J. B. Doughty, of Reform; Maggie E. Howard, of Mobile; C. R. Jenkins, of Montgomery; I. J. Johns, of Edwardville; J. R. Jones, of Rayville, La.; C. J. Lewis, of Blocton; J. L. Lewis, of Seal; L. E. Lokey, of Gadsden; J. G. Nixon, of Mobile; J. F. Perry, Jr., of Atmore, Arthur Pitts, of Talladega; W. O. Porter; Said Shair, of Cairo, Egypt; L. L. Yerby, of Kennedy; Habid Yonssif, of Cairo, Egypt.

As assistants: L. L. Balfour, of Mangham, La.; C. T. Beacham, of Dexter, Ga.; L. C. Berkstesser, of Auburn; R. T. Brock, of Covior; C. W. Chumley, of Collinsville; J. K. Culbreath, of Atlanta, Ga.; Alfred Dockett, of Troy; A. P. Elliott, of Eufaula; P. L. Ezell, of Atlanta, Ga.; W. L. Broover, of Chattanooga, Tenn.; A. S. Hutto, of Abbeville; W. R. Ricks, of Brunswick, Ga.; C. D. Roberts, of Shellman, Ga.; J. P. Robertson, of Birmingham; W. C. Suggs, of West Point, Ga.; T. M. Walden, of Quincy, Fla.

Hereafter the required per cent. will be 75 general average and not less than 60 on any subject for pharmacist license; and for assistant pharmacist 60 per cent. general average and not less than 40 on any subject.

The next meeting of the board will be held at Montgomery, October 10th.

Maryland Board.

J. Fuller Frames has been appointed a member of the Maryland Board of Pharmacy to succeed Louis Schulze, whose term of five years expired in May.

Mr. Frames is a graduate of the Maryland College of Pharmacy, about 54 years old and highly esteemed among his associates. He was a member of the old board of examiners of Baltimore. He also holds membership in the Maryland Pharmaceutical Association.

College Commencements.

Albany College.

At the commencement of the Albany College of Pharmacy, the following students were graduated:

Samuel Aker, Harry W. Baker, Roy E. Baker, John R. A. Balje, Jr.; Archibald W. Billings, Leon H. Bonham, William Clements, William H. Covey, William J. Dromey, Harold S. Eggers, Bernard Ettinger, John J. Goodhart, George T. Gramp, Edward J. Hamman, Percy I. Hisert, William A. Humphries, Frank W. Isles, William G. Kapp, John C. Konieczny, Daniel H. Krieger, Walter H. Lathrop, William M. Lithgow, Daniel L. Myers, Fenton B. Neal, Bernie L. Nichols, Clarence E. Ostrander, John W. Pangburn, Jr.; Louis C. Potter, William V. Reilly, Alice M. Robertson, Fred Salvione, Grover B. Sanford, Helen F. Sheehy, Henry C. Sherman, Manser T. Stone, Theodore DeWitt Wands, Cyrus G. Watson, Ida F. Weber, and Charles J. Woodruff.

Prizes were awarded as follows:

Senior prize for best final examination in all branches to Miss Helen F. Sheedy; honorable mention of Clarence E. Ostrander, and William A. Humphries.

Senior prize for best year's work in pharmacy to William A. Humphries; honorable mention of Miss Helen F. Sheedy, and Clarence E. Ostrander.

Senior prize for best year's work in chemistry to Miss Helen F. Sheedy; honorable mention of Clarence E. Ostrander, and Louis C. Potter.

Senior prize for best year's work in materia medica to Samuel Aker; honorable mention of Miss Helen F. Sheedy, and William A. Humphries.

Junior prize for best final examination in all branches to Miss Julia A. Higgins; honorable mention of John L. Hemstead, and Martin C. Dyer.

Cincinnati College.

At the thirty-ninth annual commencement exercises of the Cincinnati College of Pharmacy held June 6th, degrees were conferred as follows:

Bachelor of pharmacy on: Ernest R. Bechtol, Wm. Bleiweiss, Clay D. Brinker, Frank Anton Burg, Lawrence E. Creeden, Ivan L. Davis, Lydia DeCourcy, Geo. Wm. Fillauer, Eugene C. Fitzpatrick, Charles Fred. Harding, Louis Horwitz, Herman Aug. Kahl, Harry Ferd. Klein, Vernon Stanton Lucas, Raymond Anthony Martin, Edward D. Middlekamp, Warren Martin Miller, Joseph John Remmer, Horace Smith Rentschler, Albert Wm. Ross, Harry Walter Spears, Robert Chas. Tuerck, Homer Clifford Wallace, Lucile Bertrand Wells, George Winter, and George J. Wittenberg.

Pharmaceutical chemist on: Anna F. Hare, and Amos Wm. Todd.

Columbia University.

At the commencement services of Columbia University held June 7th the degree of pharmaceutical chemist was conferred on the following-named students:

Marion Astarita, F. J. Brannigan, H. L. Hermes, F. L. Hunt, J. J. Loughlin, Jr.; A. Machol, L. M. Monell, S. Morris, V. A. Robinson, T. Weicker, and S. Wilkinson.

And of doctor of pharmacy on R. F. Blum, Roddie Minor, and W. Regnault.

Ex-Professor Chandler received the degree of doctor of laws at the same commencement.

University of Illinois.

The University of Illinois School of Pharmacy closed its course for the degree of pharmaceutical chemist June 10th, and five students received the degree. They are as follows:

Samuel Charles Annenberg, Henry W. Colson, Clifford LeRoy Foote, Roy Harry Lower, and J. Bryce Carpenter.

Iowa University.

At the commencement exercises of the College of Pharmacy of the State University of Iowa, held June 14th, the following persons were given the degree of graduate in pharmacy:

Henry Earl Bowers, Frank Anton Challed, Anita Daniel, Blaise Leonel Duhe, B. A. Fisk, Hyram Francis Gowdy, Mansfield Browning Herrald, Homer D. Long, George Thomas Overstreet, George Lloyd Parsons, Ernest Simpson, Arthur Horatio Small, Bert Miller Smith, John

Aloysius Cahill, Frank Mathias Koch, Joseph Ralph Stack.

Harry Wallace Foster and Rudolph Andrew Kuever received the degree of pharmaceutical chemist.

The commencement address was delivered by the Hon. Peter Stenger Grosscup, of Chicago, on "The Larger Outlook."

The Alumni Association prize of free membership in the association to be given to the member of the graduating class attaining the highest general average in all branches of study was awarded to Homer D. Long, of Iowa City.

Membership in the A. Ph. A. offered by Dean Teeters to the member of the senior class who in competitive examination should be rated highest in recognition and description of organic drugs, was awarded to Miss Anita Daniel of Murray.

University of Maryland.

Twenty-one young men and a young woman were graduated at the commencement exercises of the University of Maryland held June 1st at the Lyric Theatre, Baltimore. Dr. H. W. Wiley addressed the audience on the value of civic virtue and of participation in public life. He put in a word for woman suffrage, this reference being in deference to several woman graduates. Bernard Carter, the provost of the university, presented the diplomas. The graduates were:

L. Dettelbach, A. Hergenroether, L. R. Laroque, H. C. Lewis, C. W. Oertel, T. E. Ragland, J. S. Sandler, P. P. Tower, T. H. Waltz, and J. C. Woodland, of Maryland.

N. S. Avinger, O. L. Johnson, J. E. Stokes, and W. J. Wanamaker, of South Carolina.

C. B. Boyd, of Pennsylvania.

P. F. Flynn, of Connecticut.

F. Garrison, of New York.

C. O. Miller, of Ohio.

E. Artigiani, and L. T. Lombard, of Italy.

The gold medal for general excellence went to Clifford O. Miller, who also got a special prize and a third medal for excellence in histology.

Certificates of honor in the order of merit were bestowed upon C. O. Miller, Thomas E. Ragland and H. Dietel, Jr. Sidney J. Brown, Henry F. Hein, Lee Hodges, J. Stanley Smith and Ethan O. Brierson received honorable mention.

Medico-Chirurgical College.

At the commencement exercises of the Medico-Chirurgical College of Philadelphia held June 3d, pharmaceutical degrees were granted as follows:

Graduate in pharmacy to: Howard E. Ashton, John L. Ballentine, Joseph H. Becker, Frank E. Boston, William A. Burt, Anthony Cavenas, Saxa G. Davies, William F. Delaney, Nelson M. Elsbey, Frank J. Ernst, Robert P. Fischelis, Malcolm M. Follmer, Thomas W. Hardy, Bruce M. Hicks, Ralph Hassenplug, John C. Householder, Harry V. Johnson, John F. Kratz, Gerald A. Lee, Eugene V. McCawley, Andrew L. Nealon, Lafayette P. Noaker, John M. O'Donnell, John F. Schreffler, Joseph R. Sterner, Cornelius A. Walsh, Arthur F. Weaver, and Engelbert L. Weiszgerber, of Pennsylvania; Samuel Bahin, Israel Paul, Isador P. Salinsky, Edward I. Seldes, William H. Sternthal, and Leon M. Wolchek, of Russia; Ralph M. Gray, Carl E. Stone, and Robert W. Wheeler, of Maine; Benjamin A. Kramer, of North Carolina; Baker J. Burnett, of New Jersey; Richard H. Knowles, of Ecuador; Cesar D. Andrade, of Roumania; Meyer B. Bloomfield; and Francesca Megaro, of Italy.

Pharmaceutical chemist to: David F. Fisher, George A. Fisher, James E. Brewer, Chester P. Guthrie, Wilson B. Hart, Max Heller, Ralph C. Holmes, Harry V. Johnston, John B. Mockatis, John P. Snyder, Guy O. Zehner, Carl E. Stone, Cesar D. A. Lopez, and George C. Kolb.

The honorary degree of doctor of pharmacy was conferred on Dr. Seneca Egbert, dean of the department of medicine; Dr. I. V. S. Stanislaus, dean of the department of pharmacy; Dr. John H. Small, John C. Scott, Robert S. Callen, Harold C. Parish, and Paul S. Pittenger.

Prizes were awarded as follows:

Faculty gold medal, for the highest general average in the senior class, to Robert P. Fischelis; honorable mention of E. Leonard Weiszgerber.

Faculty gold medal, for the highest general average in the junior class, to William W. Hollenbeck; honorable mention of Arthur F. Brown.

The Professor Stanislaus gold medal, for the highest general average in theory and practice of pharmacy at the

final examinations, to Robert P. Fischelis; honorable mention of Arthur F. Weaver.

The Professor George H. Meeker prize of nomination to membership and the first year's fee in the American Pharmaceutical Association, for the highest general average in chemistry in the senior class, to Robert P. Fischelis; honorable mention of Eugene V. McCawley, and Nelson M. Elsbey.

The Alumni Association gold medal, to the member of the senior class passing the best examination in practical pharmacy, to Frank J. Ernst and the second prize consisting of membership in the association, to Robert P. Fischelis.

Senior chemistry prize to, William Bregy Hart, who also won the Professor C. E. Vanderkleed prize of membership in the American Chemical Society; honorable mention of Carl E. Stone, and James E. Brawer.

Junior chemistry prize to, Edward Eisenstein; honorable mention of Carl E. Medde, and Roscoe E. Riegner.

University of Minnesota.

The eighteenth annual commencement of the College of Pharmacy of the University of Minnesota took place in the University Armory, Thursday morning, June 8th. The newly elected University president, Dr. Vincent, delivered the commencement address.

The degree of bachelor of pharmacy was conferred on the following-named students:

Edward M. Adams, Ben G. Anderson, Ben S. Ash, Alberta J. Austin, Roy J. Boardman, Samuel J. Broude, Oscar H. Erickson, Frank A. Gifford, Manley H. Haynes, Wilfred R. Laliberte, Edward M. Marsh, Richard B. Meland, Susan S. Millard, Rex C. Nelson, Alice P. Newton, Albert W. Peterson, W. Estelle Prevost, Ross J. Reynolds, Adolph F. Rood, Louis Spiegel, Frank A. Steiner, James L. Titus, and Frank J. Weber.

University of New Jersey.

At the third commencement of the University of New Jersey, June 8th, the degree of graduate in pharmacy was granted to Roman E. V. Angresius, Joseph Berdich, Grochino Stassi-Pelta, Ernest N. Caliva, Max Freid, Joseph Zito, and Louis Carollo.

The degree of doctor in pharmacy was given to Albert Edel, Leroy L. Patterson, and Joseph Koffler.

University of Pittsburg.

At the commencement exercises of the School of Pharmacy of the University of Pittsburg, degrees were conferred as follows:

Graduate in pharmacy on: Henry L. Alm, Ernest E. Alvino, Sister Clementine Becker, Walter S. Bixler, Charles H. Blazier, Joseph A. Boorman, Albert A. Brackmann, Harry L. Bronkhoff, Herbert J. Brown, Thomas E. Brown, Jr., William P. Caldwell, William D. Callahan, Charles G. W. Campbell, Archie D. Canon, Mathew S. Clark, Albert L. P. Cole, Roy W. Crawford, Timothy J. Crowley, Garrett G. Cruzan, James A. Davis, Paul J. Downey, Thomas F. Diefenderfer, Erven E. Dierken, Harry A. Eicher, Leroy D. Emery, George C. Faust, Ernest J. Ferkany, Louis G. Firman, Joseph E. Franklin, Jr., George A. Geyer, Harry A. Gibson, Harry Gilbert, Harry W. Hagmeier, David C. Henry, Gustave Hirsch, Otto J. Hoffman, Shiras K. Holmes, Clyde R. Jolliff, George H. Kabler, Elmer J. Kiefer, Albert L. Kossler, Wladyslaw Lawecki, Thomas W. Lawrence, Theodore H. Lippman, Abe Markowitz, James C. Martin, Ralph V. Miller, Calvin C. Mitchell, Leonard S. Morgan, Herbert P. Mosca, Jacob O. Myers, Richard E. McAbee, James C. McBride, Donald F. McCready, Robert McGary, Ray C. McGuire, William J. McLaughlin, Warren R. McWhinney, Leland S. North, Sister M. Carmel O'Brien, Jay D. Ohl, Leo P. Phillips, Albert A. Pierce, Leo E. Portman, Theodore W. Primas, Edward F. Rhodes, Lester G. Rigby, Louis W. Ritzi, Wilbert T. Shaeffer, Ira Shaffer, Charles Shrader, Jacob Sitnek, James D. Sullivan, Lewis C. Spalding, Harry F. Spohn, Carl M. Spragg, Russell St. Clair, Charles A. Steffey, Paul L. Thomas, Egbert H. Tinkelpaugh, Roy E. Tyler, Walter W. Welsh, Harry D. Withers, Harry C. Yockey, and Peter J. Zaremba.

Doctor in pharmacy on: Lorenzo Albino, Robert Archibald, Frank X. Aron, Joseph F. Brantlinger, Harry V. Day, Alphonzo J. Harris, Guy B. House, Robert K. Norman, and George A. Weger.

Certificates were given to the following special students: James C. McNulty, Andrew Smetana, John J. Eiben, Christian S. Blum.

Temple College.

At the commencement exercises of Temple College of Pharmacy held at Philadelphia, June 1st, degrees were conferred as follows:

Graduate of pharmacy on: Osher Briskin, Jacob Goldberg, Nathan Kaufman, Michael Jules Lovenstein, Rebecca Levy, William Neville, Mabel Nelson, Leon Ross, Samuel A. Silk, and Frederick A. Schuenemann, of Pennsylvania; Charles S. Gutzeit, Harry Lashinsky, Solomon Major, and Samuel Rosin, of Russia; Ruth Gardena, of South Carolina; Camille O. G. Mims, of Louisiana; Otto Strock, of Germany; Martial A. Petrus, of Haiti.

Pharmaceutical chemist on: Howell T. Healy, of Pennsylvania.

Doctor of pharmacy on: James Connor Atix, Joseph L. Capozio, and Martha Young, of Pennsylvania.

Certificates for completion of chemistry course were given to John Christian Graf, Henry Jacob Maier, John R. McConnell, Howard Reichard Myers, and Abraham M. Sigmond, of Pennsylvania; Charles Frank Class, of New Jersey.

The dean's gold medal for the highest general average in the senior year went to Charles S. Gutzeit; honorable mention was made of Harry Lashinsky and Martial A. Petrus.

The H. Evert Kendig gold medal for the best examination in the theory of pharmacy to Harry Lashinsky; honorable mention of Charles E. Gutzeit and Jacob Goldberg.

The Henry Fisher prize for the best examination in materia medica to Solomon Major; honorable mention of Charles E. Gutzeit and Dr. Samuel A. Silk.

Membership in the American Pharmaceutical Association for the best examination in pharmacognosy to C. E. Gutzeit; honorable mention of Harry Lashinsky.

Western Reserve University.

At the commencement of Western Reserve University (Cleveland), June 16th, the following named students of the school of pharmacy were graduated.

As graduates in pharmacy: Harry M. Alexander, George N. Case, Morris E. Curtis, Otto Ebnet, Robert Hendess, Ralph Herz, Joseph A. Kundtz, Vernon C. Roller and Charles Sykora.

As pharmaceutical chemists: Austin H. Craig, William W. Harrington, and Frederick B. Snyder.

A favorable report was made in June by the committee on public health and national quarantine of the United States senate on the Martin bill to "promote the efficiency of the public health and marine-hospital service." It is different from the Mann bill, which passed the house in the last congress, but probably not so materially different as to cause the house to reject the Martin bill if it shall be favorably reported by the committee on interstate and foreign commerce. The Martin bill is more extensive than the Mann measure in that it deals more generally with salaries of the various grades of officials in the public health and marine-hospital service.

Haney's drug store, at Denver, was practically ruined, June 4th, by an explosion of gasoline in a tank used in lighting the premises. Some comphorated oil took fire and the flames spread to the gasoline. No one was injured. The loss was estimated at \$2,000.

The Griswold Drug Company's store at Chicago was robbed by burglars June 13th, of \$600 worth of goods. Other goods had been packed up for removal; the burglars apparently had been frightened away before getting them out.

A carbonator exploded in the basement of Boerman's drug store, at Pittsburg, May 25th. The explosion occurred very early in the morning, no one being in the store at the time. The damage to the building was estimated at \$150.

There is a rumor that cork-oak growing will be tried in the Southwest. Some fifty years ago the federal government started an experimental planting of cork-oaks in Arizona but abandoned the plan because of the civil war.

The bill pending in the United States senate providing for a department of health was introduced in the house last month. It was considered doubtful whether any action could be had before December.

The customary headache powder caused another death last month. A Philadelphia woman was the victim this time.

Obituaries.

JULIAN W. BAIRD.

Dr. Julian William Baird, dean of the faculty of the Massachusetts College of Pharmacy since 1895, died at his home in Boston, June 25th, following an operation for biliary calculus. He was fifty-two years old. Dr. Baird joined the faculty of the Massachusetts college in 1886, as professor of chemistry. Prior to that time he had taught chemistry in Lehigh University, South Bethlehem, Pa., for three years, and had been assistant in chemistry at the University of Michigan during the session of 1882-3. It was in 1883 that he received his degrees of A. M., and Ph. C. from the Michigan institution, and in 1890 that Harvard conferred upon him his M. D. degree.

Dr. Baird joined the American Pharmaceutical Association in 1894, and was also a member of the American Chemical Society, the American Medical Association and a number of other scientific bodies.

WALLACE PROCTER.

Wallace Procter, a pharmacist and chemist widely known in professional circles, died at Philadelphia May 27th. He had been engaged in business for the last few years in Wheeling, W. Va.

Mr. Procter was the son of the late Prof. William Procter, for many years a member of the faculty of the Philadelphia College of Pharmacy.

CHARLES FLEISCHNER.

Charles Fleischer, of New Haven, Conn., died June 22d. He was born in Bavaria fifty-nine years ago. In 1901 he was elected president of the Connecticut Pharmaceutical Association and the same year was made a member of the executive committee of the National Association of Retail Druggists.

DANIEL J. PUFFER.

As briefly mentioned in the June issue of the CIRCULAR, Daniel J. Puffer died at his home at Medford, Mass., May 22d.

Mr. Puffer was born at Boston, December 9th, 1852. He engaged in the manufacture of soda water and bottling apparatus when eighteen years old, and was connected with the same business to the time of his death. When he entered the business the firm was conducted by A. D. Puffer, and after a few years a co-partnership was formed consisting of A. D. Puffer and his three sons, under the style of A. D. Puffer & Sons Manufacturing Company. This latter concern together with three of the other leading houses amalgamated some years later and formed the American Soda Fountain Co., and during the entire period Mr. Puffer took a leading part, being president and director of all the Puffer companies. After connection with the American Soda Fountain Co. for about ten years, the Puffers severed this connection and started the firm of the Puffer Manufacturing Company, Mr. Puffer being president. He continued to take an active part in the business, displaying the energy which had been a life-long characteristic.

Following are recently reported deaths of other persons in the pharmaceutical world:

EDWARD F. BANTZ, at Pittsburg, June 6th.

FRED B. BROWN, at Oconomowoc, Wis., June 13th.

THEODORE F. BROWN, at Washington, Ohio, May 25th, aged sixty-three years.

H. P. BUFFINGTON, at Defiance, Ohio, aged eighty-two years.

N. F. HAZEN, at Covena, Cal., June 1st, aged seventy years.

CLARENCE T. KIRBY, at Towanda, Pa., May 31st.

O. E. H. KLOPSCH, at Brooklyn, June 25th. He had been in business at Myrtle avenue and Cumberland street for twenty years.

L. E. MULFORD, at Chicago, May 21st, aged seventy-two years. In the earlier part of his life Mr. Mulford was in the drug business at Toledo; during the past thirty-five years he had been a commercial traveler.

G. F. PARSONS, at Troy, Ohio, aged sixty-three years.

LOUIS SCHREINER, at Callicoon, N. Y., June 8th. He was a member of Wenzel & Co., of this city.

WARREN B. SMITH, at Providence, R. I., June 2d, in his twenty-first year.

P., D. & Co. Excursion.

The twenty-first annual excursion of the employees of Parke, Davis & Co. occurred June 21st. For the pleasure and comfort of employees and their friends as guests, the firm chartered for the day two of the largest excursion steamers, "The Greyhound" and the new boat, "Put-in-Bay," on which some 5000 people were taken to Put-in-Bay. The occasion was primarily a basket picnic, the excursionists for the most part carrying boxes of luncheon, which was partaken of, as fancy dictated, either on the boats or after landing. Little parties came together on the decks and in the cabins or in the grove at the island. Dinner was also served on both boats and at Hotel Commodore, Put-in-Bay, for those who were not otherwise provided.

Dancing was participated in on the steamer "Put-in-Bay" and at the island, Finzel's orchestra supplying the music. A ball game was played in the afternoon between executives of the company and traveling representatives.

Temporary Modification of the Saccharin Order.

The federal authorities have temporarily suspended the order prohibiting the use of saccharin in food. Until January next its use may be continued providing the presence of saccharin is plainly declared on the label.

The reason given for this is that time be had for examining into the question and to review the opinion rendered by the referee board.

What is believed by some to be a record price for North Carolina real estate was paid by P. A. Thompson for a lot 24 by 100 feet at the corner of Liberty and Fourth streets, Winston-Salem, N. C., the other day. The price paid was \$40,000. Mr. Thompson owns the adjoining property on which his drug store is located, and it is his intention to combine the two sites and erect a modern building with a drug store on the corner.

The Druggists Circular

Entered at the New York Post Office as second-class matter.

ESTABLISHED 1857.

Published monthly at
100 William street, New York, by
THE DRUGGISTS CIRCULAR,
William O. Allison, President and Treasurer.
D. G. Bogert, Secretary.

Address all communications to The Druggists Circular.

Subscription Rates.

For the United States and Mexico, TWO DOLLARS PER YEAR; if paid in advance, ONE DOLLAR AND FIFTY CENTS. Foreign and Canadian subscriptions, \$2 a year, payable in advance. Remittances should be made by Check, Express Order on New York, Post Office Order or Draft on New York, payable to The Druggists Circular.

Net Advertising Rates.

	3 months.	6 months.	12 months.
One Page.....	\$248	\$438	\$750
One-Half Page.....	142	238	438
One-Third Page.....	115	166	300
One-Quarter Page.....	86	125	225
One-Sixth Page.....	60	100	166
One-Eighth Page.....	45	70	125
One-Twelfth Page.....	34	56	100
One-Sixteenth Page.....	25	43	75
One-Twenty-fourth Page...	19	33	56
Card 2½x¾ inches.....	11	19	33

Special prices are charged for preferred positions.

Changes for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

NO ORDER GIVEN TO ANY REPRESENTATIVE OF THIS PAPER BECOMES BINDING UNTIL APPROVED BY ITS MANAGER.

QUESTIONABLE OR UNDESIRABLE ADVERTISEMENTS WILL NOT BE ACCEPTED.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LIII. NUMBER 8.

NEW YORK, AUGUST, 1909.

WHOLE NUMBER, 632.

Duns and Collections.

Perhaps no one feature of the business gives more annoyance in a majority of stores than the matter of collecting—or failing to collect—small accounts. We feel quite sure that most druggists would be glad to pay a good price for and distribute as free souvenirs among many of their customers, any remedy that would be sure to make such customers live up to the thirty-day rule printed on the usual statement of account. But unfortunately for all kinds of business people, and especially small shop-keepers, no such remedy as the one mentioned is on the market, and nothing but such a wild flight of the imagination into the realm of folly as could occur only in the overheated season could make us conceive of such a thing. But the fact stares every store-keeper in the face every time he opens his books, that there is a big field for anything which would cause people to settle.

We say every store-keeper who looks into his books feels the want of something to make people “come across”—as some of our Southern friends might say. Perhaps this is an exaggeration, but we doubt it. If the store-keeper had no books to look into he might have no delinquent debtors, but where there are books there are almost sure to be on them names of people who can not or will not liquidate promptly or at all. We once knew a man who opened a store and said that he was going to demonstrate to the people the possibility of doing a strictly cash business. He said that he was not going to sell a thing on credit, not even to the president of the bank, and that if any of his clerks did he would take the amount of the sale out of his wages. It was not long before he was doing a big farm-supply trade and taking notes secured by crop liens and chattel mortgages. That was a long time ago, but our present recollection is that he failed. About the same time a druggist was forced out of business on account of his inability to collect a number of small bills due him. His successor determined to profit by his experience and to give no credit to anyone. In less than two years he too was out of business with hundreds of dollars on his books—where most of them still are. Among his creditors was a young lawyer, and to him were turned over the books, the druggist shrewdly arguing that he could save the lawyer's account by taking its equivalent in services. But a druggist is no match for a lawyer. The attorney collected some of the ac-

counts, and kept his commissions, but what he owed never grew less. These are slight digressions, but they serve to illustrate the point that where there is credit there are likely to be bad accounts.

Perhaps there are as many different reasons or excuses for failure to settle accounts as there are different kinds of men and women, or different kinds of minds. No one form of request will have the same effect on all debtors, any more than one kind of music, literature, work or sport appeals to all alike. Personal equation must be offset by personal equation. In this issue of the CIRCULAR are suggestions offered by two contributors on the subject of collections, as well as two notes from other papers. If these ideas help, or any one of them or combination of several of them materially aids in his daily or monthly work the wearied collector of small sums due on store accounts, then this number of the CIRCULAR will go down in history as the one which did as much to elate the partner who specializes in the accounting department as any other number has ever done in elevating the member of the firm who holds up the professional end of the establishment. We hope that such an achievement is before this number, as we can not at the moment think of any way in which we could render any more immediate and tangible aid to our readers than by showing them how to get what is due them for services rendered and goods delivered.

The Next N. A. R. D. Meeting.

That the druggists of the United States need a strong central organization to look out for their interests in a way that the American and State pharmaceutical associations can not, is a proposition too apparent to need arguments in its support. That the National Association of Retail Druggists has proved a stronger and more militant organization than any other of its kind that the druggists of the country have ever formed, is also an admitted fact. The famous “Indianapolis decision” of May ninth, 1907, deprived the national association of what seems to have been its chief rallying cry, the protection of prices on “patents,” but we said in commenting on that decision, and we repeat now, that so far from ending the life of the association, the opinion of the court that its price-protection plan was illegal merely cleared the way for it to expand and grow along healthy lines.

We are sorry that the druggists have not set to work more diligently during the fiscal year of the association just closing to accomplish some of the tasks that are before them. A very perceptible lukewarmness in some of their work, compared with the former fervor of their feelings toward features of it now involuntarily abandoned, is manifest to all who have given the matter any thought. The propaganda in the interest of official remedies, postal legislation, "shorter hours" and Sunday closing, patent law reform and many other things that have been touched upon by the National Association of Retail Druggists at one or more of its eleven annual meetings need attention now as much as they ever did.

Doubtless the Louisville meeting, to be held September sixth to tenth, will prove a crucial one in the history of the organization. We should like to see those members who have the best interest of pharmacy at heart present in sufficient number to insure an outcome that will prove pleasing to their kind.

Pacifiers As an Abomination.

Women with ugly mouths once gave us an excuse for writing about the evils of the germ-bearing, gum-distorting and generally iniquitous thing of bone and rubber used by poorly-informed mothers to "pacify" their babies. The publication of our sentiments raised a vigorous protest from a drug clerk who, after working sixteen hours every day, went home at midnight and accidentally waked his baby, and would have had to walk the yowling kid until nearly time to open the store again but for a "pacifier." Later, however, this same clerk wrote us that he was convinced that we were right and he was wrong. All of which and more may be seen by those who care to take the trouble to consult the volumes of the CIRCULAR for the past four or five years.

Doctors have long known of the permanent disadvantages of using the mouth distorter, and we have done what we could to call the attention of druggists to them. Even some of the general public have "caught on" and are beginning to blame the druggist for the extensive use of the little abomination. A correspondent of the *New York Times* signing herself (or himself) "Auntie Pacifier" recently had this to say:

Now that you have come to the question of teeth, particularly those of children, and express the belief that "parents and children may be educated in the care of the teeth," let the parents learn of the damage caused by the persistent, and, among poorer classes, the universal sucking of a rubber nipple sold as a "pacifier." This instrument causes thickening of the tongue and raising of the roof of the mouth, thereby distorting the nasal chambers and causing a protrusion of the upper front teeth, a protrusion which is only exceeded in extent by that caused by thumb sucking.

Only prosperous people are able to pay for the services of an expert orthodontist, as his work, involving as it does the element of much time, cannot be both cheap and good, but may be either separately. The poorer children are ignorant of the cause of their physical defects, their sickly bodies often becoming tubercular from dental deformities. The usual explanation is, "Oh, his father and grandfather had just the same shaped mouth," as if that

excused anything. Scarcely a druggist carries in his stock the teething ring formerly given to children. I recently searched the neighborhood of ten blocks on the upper west side for one of these, but found only a celluloid ring that was fitted with the modern villainous contrivance known as a "pacifier."

Every time the public is aroused against the iniquity of selling alcoholic beverages or morphine or cocaine preparations in the shape of "patent" medicines, or the promiscuous dealing out of caffeine-laden soda-fountain beverages to children, or acetanilide or phenacetin headache wafers to anyone who calls for them; or even of supplying the innocent-looking but really "villainous contrivance known as a 'pacifier,'" druggists are sure to come in for their share of the blame, and to lose "caste" with the more intelligent and thinking class of the public as a consequence. This is unjust to those druggists who do their duty in regard to these things, and we should like to see the coming of the time when such druggists shall be in so large a majority that the others will no longer be the ones from which any considerable portion of the public gets its ideas of the ethics of the drug business.

Examining Candidates.

Hiring a clerk is an interesting procedure for both the man who is doing the hiring and the man who is seeking a position. Many questions are asked by the employer as to the experience, habits and expectations of the applicant for the place and not a few for the purpose of ascertaining what he knows about pharmacy.

An experienced drug-store proprietor and sometime board member in a recent contribution to the CIRCULAR said that in examining a board candidate he treated him as a man who had applied for a position in his store, and from his answers he could tell whether he was a safe man to trust behind the prescription counter regardless of whether or not he was cut out for a professor in a college of pharmacy. We were reminded of this bit of common sense by looking over some of the examination papers used by board members during the past few months. If we wished to be critical we could pick out from these papers some of the questions which, presumably, the examiners would ask of candidates for positions in their respective stores. For example: "State briefly the chemical reaction which takes place in preparing liquor chlori compositus?" "Explain the process for the manufacture of sulphuric acid." "Name one drug from each of the following natural orders, linacoe, magnoliacoe, filices, gigartinactae, simambacicao" (the examiner probably meaning linaceae, magnoliaceae, gigartineae, and simarubaceae, the copyist doing him—and incidentally the candidate—a bad turn). "The monacetyl derivative of anilin is officially known as what?" "What three metals produce the greatest number of official preparations?" "Give habitat of gelsemium." "What is sublime sulphur?" "How many official pills contain sapo?" We say we might pick out many such questions as these if we were disposed to be critical, but we prefer to be just, and so

give the examiners credit for asking a large proportion of well considered questions.

But, in doing justice to the examiners we should not lose sight of the fact that something is due to the young men and young women whose future is largely in the hands of these examiners. Such questions as we have quoted, while they constitute a very small percentage of the papers from which they are taken, are surely not calculated to bring out the best there is in a candidate; indeed some of them might more reasonably be expected to make him so confused that he would experience difficulty in concentrating his mind on the really sensible and important parts of the examination.

The demand is for better clerks. Perhaps one good way to go about getting them is to have better examinations for them. There is improvement going on in this regard, but there is still abundant room for more, as any competent judge must agree after carefully examining the board questions which are printed from month to month in the columns of this journal.

SHORTER HOURS FOR DRUGGISTS is a subject upon which it is always safe to have something to say, and it is also a subject upon which much has been said during a somewhat protracted period of time. The story is told of a young doctor who went to work as soon as he emerged from college and cured a chronic old case which older physicians had been attending for years. A more experienced practitioner took the novitiate to one side and told him that he would ruin the business if that was the way he went about his work, as the cured man had been one of the principal sources of income for the doctors in the county for some dozen or so years. Perhaps this story is wrong, for on second thought we believe it was a young lawyer who caused consternation among his brethren by settling an old suit out of which they had been paying their rent and grocery bills for quite a while. Lawyer or doctor, the point is the same, and it is here brought out just to show how there seems to be no immediate danger of some bright young druggist or drug journal editor rising up and robbing us of this perennial subject of oral and written discussions. Long before the present generation of druggists and writers were out of school and before most of them were even born, the CIRCULAR was agitating the question of "early closing." In 1867, in reverting to the subject, it urged the American Pharmaceutical Association and other organized bodies of pharmacists to bring weighty forces to bear to accomplish the desired object. Possibly some good has been accomplished by the continued agitation of the matter for all these years, but we still hear of opening the store at seven and closing it at eleven (maybe) as of yore. A few years ago there was such a strong movement made in this city for "shorter hours" that a law was enacted limiting the time of labor of drug clerks in Greater New York to 136 hours in two weeks. This law is still on the statute books, but has not diminished the occasion for the agitation so one can notice it to any considerable extent, and therefore the subject is now just as much alive, even in this city, as it ever was. Maybe it will be found worthy of the serious attention of the Na-

tional Association of Retail Druggists, as we suggest elsewhere in this issue.

INTERNAL REVENUE TAX is something that druggists are not especially fond of paying. Just which tax they are especially fond of paying it is not our intention at this time to undertake to point out. We repeat, however, that it is not the one levied by the United States government on all dealers in alcohol or alcoholic liquors. Perhaps there are good reasons for this; perhaps the druggist thinks it is unjust for him to have to pay a special tax for the privilege of supplying a remedial agent on which his profits are in some cases less than the amount of the tax; or he may resent the imputation that he is a retail liquor dealer, when he is not. But no matter whether he objects to paying the tax for academic reasons or simply because he feels that he needs the money worse than Uncle Sam, if he is liable for the tax he had better so declare to the proper authorities and pay it, as failure to do so subjects him to penalties which may prove even more onerous than the tax itself. And this, of course, most druggists understand and do. We were under the impression that all of them did, or practically all, until testimony to the contrary came from the recent meeting of the Pennsylvania Pharmaceutical Association, where it was stated that many druggists were trying to evade the payment of the twenty-five dollars a year which the national government charges for license to deal in alcohol. The association seems to feel very strongly on the subject, and sent out a sort of "C. Q. D." to the pharmaceutical journals, asking them to warn those druggists who had been lax about this matter, and tell them that the revenue officers were camping on their trails and in case they found any who were selling alcohol without license might have them penalized at the rate of half the license fee for every year they had been without the permit. A druggist haled to court for failure to pay his "retail liquor dealers' license" tax would have a lot of explaining to do, not only to the judge but to some of his neighbors.

WHEN THE DAILY PAPERS take cognizance of the bad effects of dangerous drugs, we may expect the lay public to begin to accumulate a few ideas on the subject. The medical and pharmaceutical press may sound warning after warning as to the evils attending the indiscriminate taking of coal-tar headache powders and the public is not reached by the admonition except indirectly through physicians and pharmacists. Popular weekly and monthly periodicals can and do help wonderfully in the campaign of educating the people, but not many of them are very persistent in telling the people what they very much need to know about self-medication. The bulletin on coal-tar analgesics mentioned more extendedly among our book notices this month has aroused the editor of the *New York World*, who, in concluding a mention of it, says: "The coal-tar drugs have proved an invaluable aid to the medical profession. In the hands of the untrained they are dangerous remedies. The patient who makes himself his doctor in prescribing them has the worst of fools for his physician." If something like that appeared in every daily or weekly paper every day or week, we should not have to read so much about the increased death rate from heart disease. Several other newspapers which have come under our observation have given some prominence

to the findings set down in the bulletin in question. Pharmacists can not compel the lay press to warn the public not to be misled by the specious promises of the medicine venders, whose only object it is to get the money, but each one can do his own duty in the matter, and by so doing exert an influence which may be more powerful than he suspects.

THE AMERICAN PHARMACEUTICAL ASSOCIATION'S ESCUTCHEON has been slightly tarnished by the manner in which the association has abandoned one of its most valuable and loyal members after having led him into an uncomfortable position. The story has been told in the CIRCULAR and doubtless most of its readers who have any interest in the matter are more or less familiar with it; they know how the association induced George M. Beringer to read a paper on a subject which it assigned to him; they know how a suit at law grew out of the reading and publication of this paper; they know how the association might have been held equally liable with Mr. Beringer for any damages growing out of the reading by him and the publication by it of the paper; they know how Mr. Beringer defended and won the suit unaided by any moral or financial support from the association; and they know how, after the lapse of two or three years, the association has taken no official steps whatever to assure Mr. Beringer of its gratitude to him for having stood between it and a possible suit for damages, or to offer to compensate him in any degree for his loss of time and money and the great nervous strain under which he labored during the pendency of the case. We say that this action, or rather lack of action, on the part of the great American Pharmaceutical Association has slightly tarnished its escutcheon. This tarnish may be removed with but little effort if the task is undertaken without further delay, but it yearly grows darker and deeper, and if something is not done soon to wipe it off it will grow into an ineradicable blot. Can the association afford to allow this? We think not.

CLERKS ARE ADVISED by one of our correspondents this month, and also by a contributor to another paper whose "Don'ts" we have reprinted in this issue. We do not expect any clerk to heed all this advice, and we do not expect all clerks to heed any of it. Some, if they read it at all, will probably say "Rot!" and light a fresh cigarette—"on the house"—and proceed to confide to some of their cronies around the door how they are too smart to do more than they get paid for.

PUBLISHING A PHOTOGRAPH for advertising purposes without the permission of the subject has been made the basis of lawsuits in at least three States that we can think of at the present time. The latest of these suits is reported from Rhode Island, the others having been tried in New York and Georgia. In this State a majority of the highest court decided that the subject could not prevent the use of her portrait as an advertisement at common law, so the legislature at once made a statute covering the case. In Georgia the supreme court unanimously decided that the person whose right of privacy had been violated as mentioned is entitled to a verdict for damages, whether special damage is proven or not. Now the newspapers tell us that the supreme court of the littlest State has decided that a person at common law has no such right of privacy as indicated. Here

seems to be a case of two courts against one; and a really definite and final adjudication of the point at issue would serve to clear up a situation concerning the merits of which we are at present left in considerable doubt.

THINGS OF INTEREST IN THE CIRCULAR have been found and commented upon by a number of our friends in the South and West who responded to our invitation (printed in the CIRCULAR for June, page 276) to write us what they had seen in this publication during the past year or two that had proved especially valuable to them. We regret that the letters of some of them who live at a great distance did not reach us in time to permit us to quote some of their words of hearty appreciation, with those of others, in last month's number. We are a little backward about devoting space to this kind of material, and feel that having overcome our modesty once and used two or three pages in printing the flattering things that some of our readers say about us, we should hardly be justified in dwelling at length on the subject again so soon. However, we are none the less appreciative of the kind words on that account, and assure all our friends that their letters of approbation and commendation come as a sweet and precious ointment to us in the rounds of our daily work.

IF THE DRUGGIST ONLY KNEW which features of his business attract customers and which repel them; if he could only put his finger on any one line and say for a certainty that the good it does him is not in proportion to the time, space and effort it costs; if he were able to ascertain positively which of his clerks were giving him the best returns for the money they cost him; if he could tell whether or not it paid him to sell soda water, to sell cigars, or to sell stamps; if he could foresee whether moving to a more expensive store would result in an increase in sales more than sufficient to pay the increased rent; if he could do all these things, how much easier it would be for him to get along! Some men's judgment seems to be right on all business matters and these succeed. The business judgment of others seems to lead them to do the wrong thing as often as not, and these usually fail. Success is a matter of doing the proper thing at the proper time, and blessed is the man who can do this three times out of five.

THE AMERICAN PHARMACEUTICAL ASSOCIATION holds its convention a month earlier than usual this year. The place is Los Angeles and the time is from August sixteenth to August twentieth inclusive. Special trains are to run for the accommodation of members, the schedules of which have been printed in the CIRCULAR. The round trip fare from New York is a little over one hundred dollars, exclusive of the Pullman fare of some twenty-odd dollars.

ONE OF OUR BOARDS OF PHARMACY in examining candidates concerning doses, asks that the dose be given as set down in such and such an unofficial book. Suppose the candidate has never studied that book, then what?

URINOMETER SET FREE is a headline in one of the drug journals. What was the charge?

Can a man with high ideals succeed? Yes, he can, but he must have something more than his high ideals—an ability to work, for instance.

Collections of the Druggist.

BY THE BUSINESS PARTNER.

Bad debts had been piling up for five years. There were some that could not be collected under any circumstances. All kinds of inducements had been made. Threats had been filed. Collection agencies had given them up.

One day there appeared at the drug store a young man who offered to undertake to collect all the bad debts of the house. He had some original ideas on the subject. To him was given a number of bills to run through, and copies of the correspondence in connection therewith were laid before him.

The young man contracted to collect all or part of the bad accounts on a certain percentage. As the bad accounts had, in most cases, been dropped as worthless, whatever could be obtained on them would be just so much gain to the store. Therefore the young man, whom we may call Rouser, was engaged, and we gave him full headway with the half barrel of old bills which had been accumulating for a number of seasons. The clerk of the establishment was set to work fishing out old and forgotten unpaid accounts. There were bills which were dated five years back. There were some which had been outlawed. There were bills which had been returned on account of the death of the man who contracted them. There were bills there on which a small amount had been paid and on which the rest had been considered as lost to the house. There were bills of the poor widow and bills of the rich bachelor. There were bills of cranks and bills of men of talent. There were bills of policemen and bills of ministers.

Evidently there was work ahead for Rouser. But Rouser had a system, and his work was blocked out according to that system. Its success meant bread and butter to him. Rouser simply got busy in a corner of the store. He had a discarded desk all by himself. He was allowed to use pen, ink and postage stamps, but he was not to receive a cent for his time. At the beginning he said that he expected no returns for thirty days, after which he expected money to come in. He expected more in sixty days and another influx in ninety days, at the end of which period he would quit. Rouser expected to reap a harvest of coin. He proceeded slowly, carefully and mechanically. He devoted six solid days to classifying the accounts, making stacks of the bills, and carefully noting their amounts, the individuals or firms against whom they had been drawn. He set to work to find out why such and such a bill had not been paid.

At the end of the six days Rouser had his pile of accounts in order for actual business. He had attached to the margin of each bill a slip of paper on which to enter a description of the debtor and all circumstances appertaining to previous attempts to collect it, the stated reasons for non-payment, etc. Then Rouser had some circulars printed. It was the same old scheme of dunning by mail, but Rouser wanted to get in touch with each and every one of the persons. So the regulation dunning imprints were made, with the usual covert threat of turning the account over to the collection agencies, etc. Rouser sent out the accounts in sealed envelopes bearing two-cent stamps. During the next twenty days he received answers from possibly one-fifth of those whom he had dunned. Some returned the bills without comment. Others made some remarks about not being

able to pay. Some denied the accounts entirely. Others were sarcastic. Some had gone out of business. Others had died. About five per cent. of those heard from actually paid the bills. One man wrote that he had forgotten the matter and enclosed his check. Another who had paid part down settled for the balance. At the end of the thirty days, not enough money had come in to pay the cost of printing, postage and incidentals, to say nothing of the pay for the thirty days' time of Rouser.

But Rouser continued to smile. True he was losing time and money, but he had a system. He devoted the next thirty days to writing personal letters, mostly in his own hand-writing, to the delinquents. He used a typewriter part of the time, and dictated some of the letters, all but his signature. Rouser had been "looking up" the debtors. He studied the men and women from their correspondence in some cases. In other cases he got information from local collection agencies. He even wrote to the postmasters to get tabs on certain people. Firms that had failed and begun business again he traced through the commercial directories. He kept plugging at it.

In about fifteen days the replies commenced to arrive in response to the individual communications. Rouser's smile now began to widen. The returns were encouraging. Some of the people wrote and stated that they were pleased to get a personal letter concerning the account which they had so long before forgotten. They said they would settle at once, and asked pardon for the delay. Rouser had touched a tender chord in many of the delinquents and checks, money orders and cash were coming his way, although hardly in a paying amount, as time was passing and the expense of correspondence was heavy. However, Rouser never once showed signs of deserting his system. The second period of thirty days terminated with about twenty per cent. more of the delinquents paid up, and a goodly number with letters of promise to pay on next pay-day, or at the end of the month, or something like that.

Then Rouser began to put in some telling licks. His scheme had not paid salary and expenses. He started out one morning at the beginning of the third thirty-day period to make personal calls upon all who had not settled. He was met with a cold look and a stony stare in many instances. In other cases the bill was paid as an every-day occurrence as soon as he presented it, and no reference whatever was made to the lapse of years since it had been made. Rouser found some of the debtors had left that section of country. He went from place to place and visited and entertained. He attended the entertainments of certain persons in order to get in touch with his people. He went hunting with one man who owed nearly fifty dollars and the next day the account was paid. One man offered him a lot of land in settlement of an account, and another actually expressed a willingness to part with a casket on the same terms.

And thus Rouser worked. The third period of the ninety days expired and he cast up his accounts. He gave the members of the firm a pleasing shock when he turned in to them a little heap of checks and a drawer laden with cash. Rouser had gathered in about sixty per cent. of the abandoned accounts. After paying all expenses of the collections for three months, his commission was about \$600. The firm presented to him a good bunch of the non-collectable bills which were left over, and told him he could have

what he could get out of them. But when Rouser finishes with an account it is not worth much, so he asked if he could have blank paper instead.

Duns.

BY BERT. KAHNWEILER.

In the mass of detail connected with any successful business the problem of collections is one of the most intricate to solve that I know of. Not only does this problem call for a great deal of head work but it also demands an exceptionally good knowledge of that baffling subject—human nature.

In the drug business especially where one's customers are sick, and therefore irritable and easily offended, the collection of money is a very delicate work. There is no fixed rule for getting what is due on account; if there were, the matter would be a simple one. Circumstances alter cases. When bills have to be met and the money is not on hand with which to meet them, then the merchant just has to get down and plough rough land, even if he finds it unpleasant work and he runs the risk of driving off good customers.

Of course a good many accounts may be partly straightened out by personal calls and requests. This practice should always be followed if practicable. There is no better way of collecting than by the free use of the personal element. I have known a merchant to send out his bookkeeper or his clerk to raise money and when he returned empty handed, the merchant himself would go to the same people the next day or so and get just what he was after. Seemingly people are more impressed when "the boss" calls.

Women as a rule are very hard to collect from, as few of them are trained in business or financial matters. They would like to buy or pay as they choose, and sometimes when asked to pay they grow indignant and take their trade elsewhere. Perhaps it is just as well that some of them do go elsewhere and the loss of their accounts may be charged on the hard worked "profit and loss" page.

On the other hand, a little tact or a good personal appeal letter may work wonders. I give below a form of letter that we have used to good effect. It may help some readers to get many a dollar that has been given up as being as good as lost.

Dear Mrs. Doe:

You no doubt realize that we have been very indulgent in the matter of your account with us. We now have some heavy payments to make and we cannot do this without the assistance of our friends. We must therefore beg of you to let us have as much as you can possibly spare on account.

If you find that you cannot pay cash we will try to arrange to use your note.

If we were not in urgent need of money we would not make this appeal.

Thanking you in advance for your attention, I remain,

Yours very truly,

Letters on the order of the above will often bring refractory folks around to be the paying kind.

When people learn that the druggist is keeping a close watch on his books they will pay more promptly and will have more respect for him and his business methods. It is not meant by this that accounts of those who are poor or in needy circumstances and have much sickness to combat, should be unduly

harassed. They have troubles enough already, and if they have the stamp of honesty the druggist can afford to help them out in a way that will bring far greater returns than he may imagine.

In my experience I have never come across a better letter asking for a payment than the following. It is certainly worded just right and has the right swing to it. Perhaps it will be of use to some of the CIRCULAR's readers. It isn't exactly necessary to add that the man got a payment.

Dear Sir:

We are endeavoring to collect accounts due us in order to replenish our bank account. We make it a special point to pay every bill we owe every month, and in order to do this have to depend solely on our patrons to whom we have been pleased to extend a line of credit.

We assure you that it has been a pleasure to execute your order to the best of our ability, and in return for this we are asking for your kind consideration and a remittance of the amount you owe us, as per bill sent you the first of this month.

Please do not lay this aside and put the matter off but give it the prompt attention we gave your order.

Yours very truly,

Another good method is to send the bill with "For comparison only" written on it. This helps a good deal. A few words written on the bill as to needed funds also goes a long way toward securing prompt payment. As stated, it is a very difficult proceeding, this collection of money. As a *last resort* a good collection agency may be called in but it "kills" the customer—and he will tell his friends, besides. As his was a hard account it is probably just as well that he tell his friends.

I hope I have given a few hints as to result-getting on a daily question that gives business men bad dreams and headaches.

Credit and Collections.*

BY BERTON ELLIOT.

I would give special attention to credit and collections. There is no other phase of merchandising which must be so delicately handled—none which requires such great diplomacy and keen judgment.

In the first place, I would not take chances in extending credit to anyone who was known to be somewhat doubtful pay, with the fond hope that I, by some freak of fortune, would be quite sure to secure my money, even if others had sometimes failed to do so. In order to swell sales there is a great temptation to take more or less doubtful risks—but I would hold to a hard and a fast rule to pass them all up. I would let my competitor have this business.

While you can protect yourself entirely against the professional deadbeat and worthless character, at the same time credit is largely a matter of faith and confidence, from start to finish. You cannot be absolutely sure of any particular account until you actually have the money in your pocket.

So long as there is an element of chance in every credit transaction, it is hard not to show by your face or manner some feeling of doubt and reluctance, when one is applying to you for credit. I would try not to do it, however. I would make up my mind quickly as to whether or not I should allow credit. If I decided to allow it, I would act as though it was one of the great-

*Portion of an article from the *National Druggist*.

est pleasures of my life to extend credit in this particular case. I would not hem and haw, and look worried and perplexed, and finally wind up by granting it—if you do a thing at all to accommodate your customers you might as well get full credit for it, and increase their friendship and loyalty to your store through your spirit of willingness and evident desire to accommodate them whenever you have the opportunity. If I formed the conclusion that it would not be good business to allow credit, I would break the news as diplomatically as I could, and try to retain the customer's good will and cash trade if possible. If I did not feel justified in deciding the matter definitely without making inquiries, looking up the party, etc., I would try not to be two or three days doing it.

In the extension of credit a man's habits are one of the best indexes to go by. As Benjamin Franklin aptly expressed it:

The most trifling actions that affect a man's credit are to be regarded. The sound of your hammer at five in the morning and nine at night, heard by a creditor, makes him easy six months longer, but if he sees you at a billiard table, or hears your voice at a tavern, when you should be at work, he sends for his money the next day.

An industrious man of good habits very seldom contributes to the debit side of your profit and loss account.

As stated above, you cannot be absolutely sure of any particular account until it is settled. The man who is worth a million to-day may be ruined to-morrow. For this reason it behooves every merchant to make collection of every account just as promptly as possible, and not be negligent and over-indulgent with people of even the best standing in the community.

There are three ways of getting money from debtors. Some merchants are always mild, merely asking politely for money at regular intervals. Others resort at once to brutally insistent demands, threatening and attempting to frighten the debtor into paying. Still others are sympathetic in their attitude, with the idea of wheedling the money out of them. I would use all three methods. All three are good, and each has its special value. The mistake that many good merchants make is to use one method exclusively.

I would divide my charge accounts into three classes: (1) Good customers who are merely constitutionally slow in paying bills. (2) Unfortunate customers with little money, who pay first those they like the best, or those who wheedle them most successfully in a sympathetic way. (3) Those who are constitutionally mean and appreciate nothing but a club. I would get after each debtor, according to his classification.

In dealing with class 1, it is comparatively an easy matter to handle collections successfully. There is generally very little danger about the account being good, and it is simply a matter of keeping after them courteously and persistently.

Class 2 is generally the largest class. The great majority of people have very limited incomes, and find it a constant struggle to keep ahead of the world. They get in the habit of steering off everything they can. What little money they get they use to pay those whom they like best or who press them most successfully. What such people want is sympathy and encouragement to do their best to remove the burden of debt. They do not expect sympathy from such a source, and when it comes they are spontaneously grateful, and show their gratitude by special effort

to pay this particular debt. It is also well, in dealing with this class of debtors, to find out when payday is or just when money will come in, and be "Johnny-on-the-spot" at that time.

Class 3 requires drastic measures. There are some people so thick skinned that if you want them to do anything you must drive them by whacking them over the head with a club, figuratively speaking. For people of this kind I would adopt a "brutal" attitude intended to terrify and badger them into paying. In using measures of this kind it is well to leave yourself a loophole to crawl out if your man thinks himself badly used. You should try not to get into a position where any apologies can ever be expected. Do not call a man a thief and a deadbeat in so many words. Say, rather, that "people are apt to regard him as a thief or a deadbeat if he has to be sued to make him pay his honest debts."

If a man shows an honest inclination to pay, I would avoid "brutal" measures. They should be used only for the really dishonest or very thick-skinned man. One thing to be observed in all collections is never to make any threats and then fail to "make good." You will soon get a reputation around town and people will not pay any attention to your demands. If you tell a man that you are going to sue him on a certain date unless he makes satisfactory arrangements with you, make your word good and sue him.

Bringing in the Slow Accounts.

In a short article under the above heading in *Merck's Report*, Joseph F. Hosteley submits the following letter as a sample of a kind that might be found advantageous at times:

Dear Sir:

Won't you purchase something of us that will bring your account of \$7.63 up to an even \$8. It is a peculiar thing, but we find that many people would rather cancel an indebtedness for an even amount than one of uneven figures.

If you will favor us in this regard we will appreciate the courtesy. Probably you are glad we make the suggestion.

With kind regards, we are [etc.],

Perspiration Stain Remover.

Ammonium oleate.....	2 ounces.
Ammonia water.....	2 ounces.
Ether	1 ounce.
Benzin	5 ounces.
Chloroform	1 ounce.

Mix the first two ingredients, and shake them well together. Add the benzin, with more shaking, and then the chloroform, continuing the agitation. Let the mixture stand for a while and then shake it at intervals until a smooth, creamy liquid results.

It should be remembered that the vapors of both the ether and the benzin are very inflammable.

Hunn's Liniment.

An Australian correspondent of the *Chemist and Druggist* gives the following formula for Hunn's liniment:

Oil of elder.....	2 ounces.
Oil of thyme.....	1 ounce.
Camphor	1 ounce.
Spirit of camphor.....	2 ounces.
Oil of turpentine.....	1½ ounces.
Sweet oil.....	1½ ounces.

What Can We Do to Elevate the Profession of Pharmacy?*

By A. A. COLEMAN.

The fact that this subject was first on the list of those suggested by the committee on scientific papers would indicate that this is a subject of vital importance to us. I do not believe, however, that the committee or any thinking pharmacist believes that we are going to the bad. To the careful observer it is apparent that we are steadily advancing and getting on a higher plane of business and professional ethics.

I doubt if there has ever been an age of more rapid moral advancement than the last fifty years. The last ten years, I believe, have evolved more honesty and square dealing in business than any other century.

Progress growth and elevation are all synonymous. Pharmacy is advancing. How we can help to elevate and further the good name of the profession and the pharmacist is what we would briefly consider now. We do not want to fall behind in the general uplifting of business ideals around us.

All advancement must primarily come from individual initiative. There are, however, some things that as associations we can do to help this advancement.

As an association I think that one opportunity offered for elevation, lies in our seeing that we get proper legislation. We speak of law and medicine as two learned professions, and no doubt as professions they stand high. Look how they control legislation. The lawyers are in power and have what they want in the way of legislation, but the doctors usually get only what they go after. We do not want any oppressive laws passed, nor do we want any that favor us as a class or profession. What we do need, however, is protection. You can never legislate a man into being honest, and by legislation we can never make character for pharmacists. We can pass such laws, however, that if a rascal attempts to practice pharmacy we can put him out.

As a striking illustration of effects of good legislation we might point to the pure food and drugs law. I am proud that pharmaceutical literature and pharmacists did something to shape this law. This law has banished from the market a number of preparations supposedly of pharmaceutical origin. It has closed some factories and rendered less attractive pharmacy as a field of operation for the misbrander and counterfeiter. Every good law like this elevates pharmacy.

Any profession or society is judged by the average of the individuals composing it. Every undesirable that we legislate out of our ranks raises the average of what is left. We might think of or consider who the undesirables are. We do not want incompetents, we do not want any liquor sellers, or any that make a specialty of "booze" substitutes, we do not want any dope venders, we do not want the substituter or the dishonest in any guise. Let us as an association encourage the enactment and enforcement of such laws as will abolish all such evils.

Another thing that I think as an association we should foster and encourage is the scientific develop-

ment of the profession. As conditions are now with the pharmacist there is usually a period of study and preparation for college and board examinations. After he is licensed the pharmacist usually settles down to routine work or is so taken up with the business side of pharmacy that he neglects his scientific studies.

True development requires that a man acquire the study habit and keep up investigations all through life. The joy of learning to do something better than it was done before or of making a new discovery is doubled when we tell of it. In our associations we should offer greater incentives for members to conduct scientific investigations and tell of them. This will elevate pharmacy.

No business or profession has a moral right to exist that does not perform a public service. In our association meetings I think our discussions should take in those things that make us better fitted to practice our profession more than those pertaining to the business side. If we pay too much attention to increasing our profits or trying to squeeze all we can out of our business we will not gain very much in public esteem. While on the other hand if we stress the scientific side we set ourselves apart from other mercantile pursuits, as not only business but also professional men, and our professional standing is enhanced. There is not so much after all in this matter of getting a larger profit. It is just doing things a little better and having the courage to charge a fair price for it.

Let us strive for more education, more character, better work, more leisure and recreation, more friends and broader sympathies. Acquirement of these will give us that spirit of equanimity that commands respect.

Next to what we can do in our organizations is what we can do in our stores, to elevate pharmacy.

I sometimes see a lamentation on the drift of our modern pharmacies toward commercialism and department stores where the prescription department is crowded back in one corner almost or entirely out of sight. As I see it this is but a process of evolution, and survival of the fittest. The busy drug store on the corner with handsome and artistic fixtures and side lines galore, where dirt is absent and clerks and proprietor look prosperous and dress well is a decided improvement on what some would have drug stores to be or what they were fifty years ago. I believe that good clothes, artistic fixtures, and cleanliness are doing wonders to elevate pharmacy.

If we compare the little old fashioned drug store on a side street, to a back alley pawn shop, and our modern drug store to an up-to-date bank we get the comparative impression each creates in the mind of the public. Let us fix up, keep our stores clean, and dress well. All these are for the elevation of pharmacy.

After all, however, all structures must have a foundation. The character of the individual pharmacist is the foundation on which our profession rests. Every single act, every effort for good or bad that we put forth, in some way influences our professional standing. For, as already said, the profession will be judged by the average of individuals composing it. Let us not be satisfied with doing nothing to pull the average down; let us do something to raise it.

It has been aptly said that character is what we are, reputation is what people think we are. We must

*Read at the 1909 meeting of the South Carolina Pharmaceutical Association and contributed by the author. This paper received the prize of \$10 for the best paper read at the meeting.—Editor THE DRUGGISTS CIRCULAR.

look to both. In building our reputation we should remember that we leave some impression on every one that we come in contact with—our customers, our physicians, our competitors, our creditors, the manufacturers and our friends. All these are daily passing a verdict on us, and we can do something to influence the verdict of each for good.

By square and fair dealing we can gain the confidence and good will of our customers.

Unswerving honesty and skill in compounding will gain the respect of our physicians. If a physician shows partiality to any remedy there should be no "just as good" in putting up his prescriptions. Give him exactly what he specifies. It may do good in ways you do not know of. It will at least gain his friendship.

We can gain respect of competitors by fair and frank competition. Never give one an opportunity to suspect you of unfair methods.

We gain a double reward or increased respect and best prices when we meet our obligations to our creditors promptly.

We never lose the respect of a manufacturer when we refuse to stock something that he is manufacturing as a substitute for a rival's specialty. We certainly are doing nothing but the fair thing when we supply a demand created by the manufacturer provided he has his goods priced at a living margin. Let us be fair to the manufacturer who treats us right.

There is not a druggist in the land whose sphere of influence does not include from two to ten thousand or more people. There are county, State and national government officials and politicians among the acquaintances of every druggist. Each of these acquaintances judges the profession of pharmacy by his home druggist. We never know when we will need favors or the influence of friends or politicians for measures to elevate pharmacy. Let us ever merit confidence of all and when we want favors we are likely to get them.

* If each individual pharmacist is loyal to pharmacy and its organizations, and ever strives to broaden his sphere of influence by interest in public affairs, and is zealous in building character for himself, I think elevation is sure, and the future of pharmacy is secure.

Eucalyptus in Leprosy.

Hollman, of the leper settlement at Molokai, Hawaii (*N. Y. Med. Journ.*) reports good results during the past two years with eucalyptus internally and externally (in the form of medicated baths) in leprosy. This treatment has been followed by marked lessening of leprosy neuritic pains and of numbness and coldness in the extremities; it has cured leprosy itch and decreased the frequency of "leprosy fever" which commonly accompanies an exacerbation or a fresh invasion. The author believes that incipient leprosy can be cured by this means.

Blindness from an Arsenic Preparation.

Rüte (*Münch. Med. Woch.* through *N. Y. Med. Journ.*) reports the case of a man, seventy-three years of age, who was given injections of arsazetin to treat an extensive psoriasis. Atrophy of the optic nerve was induced, similar to that seen in cases of atoxyl poisoning.

Don'ts for the Employee.*

By GEORGE W. HASTINGS.

- Don't hustle.
- Don't arrive on time.
- Don't watch your work—look at the clock.
- Don't say nice things of your employer.
- Don't think—you may better your condition.
- Don't worry—the boss does that.
- Don't get things accurate—you will be discovered.
- Don't work too hard—you may get tired.
- Don't improve your time out of working hours—you may get a raise.
- Don't be observing—you may get an insight as to how things are done.
- Don't study the whys and wherefores—you may become a master.
- Don't take an interest in your work—you may learn to like it.
- Don't try to be original—it may get you a better position.
- Don't save money—you may want to go into business some time.
- Don't retire early at night—you might be able to do a good day's work next day.
- Don't be neat and accurate about your work—you will be thought finicky.
- Don't help a fellow workman—he might return the favor some day.
- Don't read the trade journals—you may find out something you didn't know.
- Don't wait for quitting time—you might work a minute over.
- Don't let the boss know just what you can do—it may surprise him.
- Don't mind what the foreman says—he is only a figurehead.
- Don't refuse "booze"—you will be laughed at, and besides you might get a regular position.
- Don't do anything until you are told—you may get your work cleaned up and be put on something else.
- Don't be an expert in any one thing—you get enough money anyway.
- Don't do anything well—do a little of everything in a way you'll always get the work, not the money.
- Don't pay any attention to what you are doing—errors will be caught in the proof.
- And don't try to improve on the time-worn methods—the boss might think you are interested.

A Swedish Radium Society.

It is reported that an association has been formed in Sweden for the purpose of studying radium and exploiting the radium-bearing ores of that country. "Kolm," a material found in the alum-slate quarries in the province of Westgothland, is said to contain radium, and the association, we are told, has obtained control of this district, as also of a new patented process for obtaining uranium and radium from kolm and other ores. The new association is said to be quite large and to include Svante Arrhenius, as one of its leading spirits. Other countries are also investigating their radium-bearing ores, Portugal having found some very encouraging deposits, and similar news comes from Mexico.

*From the *American Printer*.

Troches in the Pharmacopœia.

George M. Beringer, Jr., and H. D. Kresge in a paper read at the recent meeting of the New Jersey Pharmaceutical Association discuss the troches of the Pharmacopœia and the National Formulary. They regard the troche as the "most elegant of all elegant pharmaceuticals," yet the "most neglected" officially. They admit the advisability of most of the many dismissals of these preparations made at the last revisions of the Pharmacopœia, but regard it unfortunate that formulas were not introduced for others, standards for which they think were needed. Suggestions are offered for these and for improvement of the formulas of some of those which are now official. This seems to us a move in the wrong direction. Troches are apt to be regarded by the laity as a sort of "candy," and to be taken as freely as one may happen to choose. In some cases this may be of but little moment; in others a great deal. We recall a case, for instance, in which alarming symptoms followed the careless use of a cough lozenge containing morphine. The comparatively mild troche is a bad example, leading to the exhibition of dangerous drugs in the same form. It would be better to withdraw official encouragement from all such preparations. That physicians sometimes prescribe troches exploited by various manufacturers is not a sound reason for making them official.

Criticism of Some National Formulary Nomenclature.

At a meeting of the Washington Branch of the American Pharmaceutical Association, L. F. Kebler, of the United States department of agriculture, offered objections to the naming of certain National Formulary preparations (*Journ. Am. Med. Asso.*) He undertook the task, he said, with the utmost reluctance and diffidence, having a keen perception of the sterling integrity of the members of the Formulary committee who had a much larger experience in some lines, but he felt, however, that it was the duty of every member to point out shortcomings.

Soon after the enactment of the federal pure food and drugs act a manufacturer asked whether the use of the name "mandragorin" was permissible under the act. He was advised that if the preparation was mandragorin, in fact, prepared from mandragora root, such name would be considered proper; otherwise, its use would be misleading and therefore forbidden. This manufacturer then stated that the product to which he was applying the name "mandragorin" was a mixture, containing, among other ingredients, the alkaloids present in mandragora root, but that the preparation was not made directly from this root; and he was advised that the use of the name "mandragorin" for such a mixture was improper. The question raised in connection with this product was the authoritative nature of the National Formulary and whether the principles embodied in its nomenclature would be restricted to N. F. preparations, or if they would be applicable to other products. Attention was called to the fact that "elixir of cinchona," synonym "elixir calisaya" was prepared by dissolving salts of the three principal alkaloids of cinchona bark in aromatic elixir and coloring the mixture to imitate an elixir prepared from cinchona bark proper.

The name "mandragorin," says the author, is no longer applied to the mixture in question; "but there is no gainsaying the fact, that the manufacturer here has a good basis for an argument. A moment's reflection will convince even the skeptic that the principle in question would open the field for innumerable improper, if not absolutely deceptive and misleading practices. For example, according to this principle it would be perfectly proper to prepare 'tincture of nux vomica' by dissolving a suitable quantity of strychnine sulphate in an alcoholic solution of proper strength and coloring the same with burnt sugar. Again, it would be just as logical to dissolve a certain amount of vanillin in a suitable menstruum, to color the mixture with caramel and call the product 'vanilla extract.' Again, a tablet containing any salt of the alkaloid berberine could justly be named hydrastis tablet. From this, it is only a step to the 'formerly' so-called 'bitterless quinine' preparations which did not contain any quinine at all, but cinchonine or possibly some other cinchona bark alkaloid. The above products are plain imitations, the sale of which, in the case of drugs, is declared illegal by the federal and many state laws. No hesitation would be entertained in bringing a prosecution against a dealer in such improperly named commodities. In fact, so-called vanilla extracts, consisting of vanillin, with or without coumarin, dissolved in a suitable menstruum and colored in imitation of genuine products, have been adjudged adulterated and misbranded by the courts in that such articles were not real vanilla extracts, but imitations designed to deceive the public." It has long been a practice, continued the author, to name medicinal preparations after a valuable constituent, even if that formed a very small proportion of the whole, and in view of recent legislation it soon began to be realized that such names were improper. The use of the word "compound" in this way is discussed, and reference made to instances in the National Formulary in which the name-giving constituent is present in only a very small quantity such as the "compound syrup of Irish moss," the "compound elixir of celery," "compound pills of colocynth," etc.

The author reported a personal interview which recently took place in connection with a headache remedy containing the word "celery" in its title. The manufacturer recognized the shortcomings of the original name and believed that the addition of the word "compound" would rectify the difficulty. He well realized that the celery present in the product did not constitute any material portion of the activity of the drug, but that its potent agents at different times were acetanilide or acetphenetidin and caffeine and other ingredients.

To meet the embarrassments which such situations might induce, a food inspection decision No. 63 was given out prohibiting the use of the name of any drug which was not included unless the complete quantitative formula was given on the principal label. This proviso, however, can not be construed to mean that when the quantitative working formula is given, any deceptive and misleading name may be used. Another question is that of priority of name, and still another the use of geographic names such as "Japanese oil," "Swedish asthma cure," etc., and there are one or two of these in the National Formulary which do not seem to be justified. Suggestive therapeutic names and habit-forming drugs are also mentioned,

and also the numerous preparations which owe their virtue to the alcohol content.

A plea to justify the use of such a name for his preparation was made by one manufacturer on the ground of the use of a similar name in the National Formulary "beef, iron, and wine" product, and the commissioner of internal revenue has seriously considered putting the latter into the alcoholic beverage class.

When the best element among the druggists is strenuously endeavoring to remove the stigma of liquor selling from their profession, it is hard to see why products of that type should be retained.

In conclusion, the author says that there are many excellent features in the National Formulary nomenclature which are not referred to because his chief purpose is to call attention to its shortcomings, leaving the meritorious features to others.

In the course of his paper the author reported that in reply to a communication made by him on the subject to the chairman of the National Formulary committee over a year ago he received a reply which showed that the committee "did not intend to give much relief to the embarrassment."

Keeping Round Labels.

Herewith is illustrated a device constructed by L. W. Marshall, who supplies the drawing and the following description and directions for making:

A Home-Made Round Label Holder.

The above rough drawing represents a handy arrangement for keeping round labels in order. Procure a block of wood and have a carpenter saw holes the size of the labels used. Save the round blocks. Take pieces of heavy cardboard (or pieces of mailing tubes and cut slits up their sides about an inch wide) and insert them in the openings and place the round blocks back. The latter will hold the tubes in place. Labels may then be stacked in the tubes where they will always be in place.

Medical Examining Board Results.

Statistics based on the examinations by State licensing boards, given in the *Journal of the American Medical Association*, show that 7,770 candidates representing 137 medical colleges were examined during 1908, with 21.7 per cent. of failures. There were 6,477 candidates who were graduated during the last five years, of which number 17.3 per cent. failed. Of the 796 who were graduated previous to 1903, 31.5 per cent failed. Non-graduates were examined in seven States, the total being 494, with 56.8 per cent. of failures. Of the 4,741 candidates who were graduated in 1908 about 65 per cent. took examinations in the States in which their colleges were located, showing that any State allowing low-grade colleges to exist is itself the chief recipient of the poorly trained output. The colleges of Illinois furnished

843 candidates with 12.9 per cent. of failures. Pennsylvania furnished 700 candidates with 6.9 per cent. of failures. The failure percentage for New York colleges was 3.2; for Maryland colleges, 24.2; for Tennessee colleges, 35.7, while for the Mississippi colleges it was 77.8 per cent.

All States require an examination of every applicant unless the candidate already holds a license from some other State. In the classification of colleges only 48 have failure percentages of less than 10 per cent., 29 have between 10 and 20 per cent., 46 colleges have over 20 per cent. of failures and 15 are unclassified.

During 1908 altogether 7,360 physicians received licenses; 6,084 by examination, 184 under exemption clauses and 1,092 through reciprocity. Of those licensed under the reciprocity provision 225, or over 20 per cent., received their original licenses in Illinois, the next highest two figures being 100 in New York and 94 in Iowa.

Official Names and Misbranding.

Since the passage of the food and drugs act official titles and synonyms are of more interest to the drug trade than ever before, and George M. Beringer finds that the titles and synonyms given in the *Pharmacopœia* are not ideal. He read a paper on this subject at the recent meeting of the New Jersey Pharmaceutical Association in which he argued that the attempt of the *Pharmacopœia* makers largely to eliminate synonyms from the body of the book and to include some of the dropped names in the index had not only resulted in turning out a poor piece of work, so far as this phase of it is concerned, but showed a disposition to shirk responsibility. He also had a few words to say about the geographical names of the *Pharmacopœia*, as Canada turpentine, Spanish licorice, German chamomile, etc., and showed how the use of these names might result in a technical infraction of the government's regulations regarding misbranding. He recommends that a note be printed in the *Pharmacopœia* to the effect that such names are used to designate certain styles or grades of drugs, and not necessarily to indicate the countries of their origin.

Attracting Members to Meetings.

One of the queries at the recent meeting of the Pennsylvania Pharmaceutical Association was, "How is it possible to interest and stimulate the stay-at-home druggist, who pays his dues but never attends any of the meetings which would bring him in touch with other pharmacists?" Franklin M. Apple undertook to answer it. He said that the member should be made to feel that he had duties to perform other than merely lending his moral and financial support to the association. If he were put on a committee one year, for instance, he would be more apt to be present the next. Then the meetings should be held at different accessible points throughout the State, and at roomy and not too expensive hotels. This would offer the inducements of novelty and comfort, and the expense of attending would not overtax the less opulent members. Perhaps it would heighten the interest of the members in the meetings if the committee on queries and papers selected in advance leaders to open the discussions of the subjects introduced, as is done in some associations.

Compound Pepsin Preparations.

In a paper on "The Compound Powder of Pepsin and the Compound Elixir of Pepsin," read at the May meeting of the Philadelphia branch of the American Pharmaceutical Association, George M. Beringer took the ground that no matter how much of a "monstrosity" was the pulvis digestivus of the National Formulary, so long as physicians prescribe it, druggists must supply it. And if they must supply it, said he, they should have a standard formula which will insure a product as nearly uniform as possible. The same remarks he applied to the compound digestive elixir. Mr. Beringer agrees with his associates on the National Formulary committee that as much of the titles of these and other N. F. preparations as carry therapeutic suggestions should be dropped.

After due theorizing and experimentation the author of the paper suggests the following names and formulas for incorporation in the National Formulary in place of similar ones now there:

Pulvis Pepsini Compositus.

Compound Powder of Pepsin.

Powdered pepsin (so-called insoluble variety).....	15 grammes.
Pancreatin	15 grammes.
Diastase	1 gramme.
Lactic acid.....	1 c.c. (mil.)
Hydrochloric acid.....	2 c.c. (mils.)
Sugar of milk.....	enough.
To make 100 grammes	

Add the acids gradually to 60 grammes of sugar of milk and triturate until they are thoroughly mixed. Mix the pepsin, pancreatin and diastase and incorporate this with the acidified sugar of milk. Weigh and add sufficient sugar of milk to make the weight 100 grammes. Triturate the mixture thoroughly and finally rub through a hair sieve and preserve the powder in well stoppered bottles.

Elixir Pepsini Compositum.

Compound Elixir of Pepsin.

Pepsin (soluble "scales or granular" variety).....	15 grammes.
Pancreatin	15 grammes.
Diastase	1 gramme.
Lactic acid.....	1 c.c. (mil.)
Hydrochloric acid.....	2 c.c. (mils.)
Glycerin	250 c.c. (mils.)
Alcohol	200 c.c. (mils.)
Oil of orange.....	2 c.c. (mils.)
Cudbear	1 gramme.
Water.....	enough to make 1,000 c.c. (mils.)

Mix the acids with the glycerin and 500 c.c. (mils) of water, add the pepsin, pancreatin and diastase, and macerate with occasional agitation until solution is effected. Then add gradually the alcohol, in which the oil of orange has been dissolved, agitating after each addition. Now add the cudbear and sufficient water to make the preparation measure 1,000 c.c. (mils). Macerate for six hours, with occasional shaking, and then filter.

George W. Hague says in *Meyer Brothers Druggist* that many manufacturers prevent gelatinization of their fluidextracts by adding to them about 30 grains of sodium or potassium hydroxide to the pint. What other effects this may have he does not state.

To Tell Natural from Synthetic Camphor.

In distinguishing natural from synthetic camphor, the melting point is of no practical value, says W. Lohmann (*Berichte through Journ. Soc. Chem. Ind.*), especially if unoxidized camphene, borneol, or isoborneol be present in the synthetic product. The optical rotation of alcoholic solutions forms the best test, synthetic camphor being optically inactive, whereas natural camphor is markedly dextrorotatory, so that in a mixture of the two, the amount of natural camphor present might be determined polarimetrically. The statement in text-books that artificial camphor does not give a syrupy liquid when triturated with an equal quantity of chloral hydrate is erroneous. Pure synthetic camphor behaves exactly like natural camphor towards chloral hydrate. Probably the error has arisen from the presence of pinene hydrochloride in the synthetic camphor employed. Since borneol melts at 208° C., camphene at 50° C., and pure synthetic camphor at 175° C., it would be possible to have a mixture of the three with the correct melting point. Consequently small fractional sublimations should be made, and the melting points of the products determined; also the amount of unsublimable matter should be weighed. The presence of pinene hydrochloride as an adulterant of either natural or synthetic camphor is readily shown by heating with twice its weight of calcium hydroxide, free from chlorine, until all the camphor has volatilized. The residue is then treated with hot water, filtered, and tested with silver nitrate reagent after acidifying with nitric acid. No opalescence should be evident.

Warm Weather Formulas.

Perspiration Powder.

Burnt alum.....	12 parts.
Salicylic acid.....	3 parts.
Starch	18 parts.
Violet talcum powder.....	120 parts.

Perspiration Paste.

Powdered starch.....	50 parts.
Salicylic acid.....	1 part.
Mucilage of tragacanth.....	enough.

Perspiration Lotion.

Burnt alum.....	1 part.
Boracic acid.....	1 part.
Elder flower water.....	30 parts.

For Malodorous Perspiration.

The *American Journal of Clinical Medicine* gives the following formula for a deodorant perspiration powder:

Bismuth subnitrate.....	1 ounce.
Potassium permanganate.....	1½ ounces.
Rice flour.....	2 ounces.

Theobromine Content of Cacao Beans.

It is shown by Kreutz (*Zeit. Nahr.-Genussm. through Journ. Soc. Chem. Ind.*) that about one-half of the theobromine present in cacao beans is in the free state and can be extracted directly by means of chloroform; the remainder is present in a combined form and goes into solution in chloroform, only after the cacao has been subjected to hydrolysis (heating with dilute sulphuric acid). The fat is extracted together with the theobromine and the two may be separated by treatment with cold carbon tetrachloride.

Abstracts.

Fictitious Scammony in French Commerce.

Warin (*Journ. Pharm. Chem.* through *Pharm. Journ.*) reports that a fictitious scammony, prepared from scammony resin instead of the juice of the plant, which has a less active purgative value than the genuine drug, is met with in French commerce. It occurs in brownish cakes less dense than the genuine drug, with a duller and more porous fracture. It softens under the teeth; when rolled between the fingers, and warmed by breathing on it, it forms an elastic ductile pill. True scammony is gritty under the teeth, and does not easily roll in the fingers as above; the pill formed is friable. The odor of the false scammony is peculiar, recalling that of resin and cooked plums; its powder is lighter and yellowish-gray instead of blackish-gray, and its appearance in emulsion with water is different. The filtered aqueous decoction does not show the fugitive red color given by that from true scammony with tincture of iodine. The alcoholic solution of the resin gives a marked red color reaction, which is not obtained with scammony. When the powder is thrown into oil of turpentine it forms fibrous flocks, which sink and aggregate at the bottom of the liquid. Natural scammony powder remains in grains in turpentine oil, and sinks without aggregating.

Permanent Solution of Aluminum Acetate.

Reference was made in our news columns last month to the presentation of a report by Dr. Diekman at a meeting of the New York branch of the American Pharmaceutical Association on several pharmaceutical articles in foreign journals, one being on solutions of aluminum acetate. This was by Gruening (*Pharm. Centralh.*) and was abstracted by Dr. Diekman as follows: The author states that the liquor aluminii acetati of the German Pharmacopœia, as is well known, contains as side products aluminum sulphate, calcium sulphate and acetic acid, the latter being purposely added in some excess to prevent the rapid production of sub-salts of lead, which however it fails to do to any extent. The author compares solutio Burowii with the official liquor, stating that although the former contains more foreign constituents than the latter; it still is much more permanent. From this he concludes that it is not the number of foreign constituents, but the kind, which influences the permanency of the preparation. He points out that one foreign constituent, namely calcium sulphate, contained in the official liquor, is not found in Burow's solution, and to its presence he attributes the precipitation and gelatinization so often observed in case of the official liquor. Although the calcium sulphate, owing to its lesser solubility in the liquid, is present only to the extent of about 0.4 per cent. it is held by the author that this amount is sufficiently large to account for the decomposition of the preparation. He goes into the theory of the matter somewhat and concludes by giving his method of removing the calcium sulphate from the official liquor, as follows: To a quantity of the liquor prepared from 1,200 grammes of aluminum sulphate he adds about 140 grammes of commercial barium acetate, or a solution of 90 grammes of barium carbonate in 180 grammes of hot 30 per cent. acetic acid. After al-

lowing the barium sulphate to subside, the supernatant liquid still reacts for sulphuric acid; he adds enough more of barium acetate, so that the latter is in slight excess. He states that this slight excess retards the separation of the barium sulphate. In order to remove the excess of barium salt, he adds 10 grammes of aluminum sulphate, dissolved in a little water, after which addition the barium sulphate separates out rapidly. The resulting liquor is allowed to stand several days, and the clear portion removed as required. It contains as foreign substances, calcium and aluminum acetates, the latter, however, in lesser quantity than in the original liquor. His experiments with a liquor thus prepared cover a period of 1½ years. He finds that when a sample of the liquor prepared in accordance with the official directions is heated to 70° C., it becomes decidedly cloudy, and at 87° C., is gelatinized completely. The same liquor, deprived of its calcium sulphate by the method given, when heated to 87° C., became only slightly cloudy. At the boiling point it clouded materially, but did not gelatinize even after prolonged boiling.

An Organic Source of Iron.

According to Tarbouriech and Saget (*Bull. Sci. Pharmacol.*) a variety of rumex, rumex obtusifolius, is richer in iron than any plant hitherto examined by them, the dried root containing 0.447 per cent. By a series of micro-chemical tests they have been able to prove that the iron is present in organic combination, inasmuch as it does not respond to the usual tests for iron. The authors have made careful analyses of the compound in order to ascertain its chemical identity, but investigations of this character are very difficult owing to the ease with which complex organic substances split off any inorganic elements that may be present. At the present stage of the work the evidence suggests that the compound is analogous to the ferric derivatives of the nucleones of Siegfried, which are so largely present in the bodies of animals, particularly in the muscles and in milk. These nucleones are generally considered to be the agents that are charged with the transport of iron, phosphoric acid and calcium in the body, and if further experiments confirm their identity with the organic compound of iron present in rumex a satisfactory explanation will thereby be afforded of the remarkable therapeutic results that have been obtained by the administration of powdered rumex by the mouth.

A Characteristic Reaction of Uric Acid.

Ganassini (*L'Union Pharm.*) proposes the following test for uric acid, it being at the same time very sensitive and yet easy of execution: If a solution of a zinc salt be added to an aqueous solution of uric acid or of an alkaline urate obtained by the addition of a slight excess of sodium or potassium hydroxide, a gelatinous precipitate of basic urate of zinc will form. If this precipitate be collected on a filter, it will turn from white to greenish-blue and finally sky-blue, in consequence of oxidization under the influence of the oxygen of the air. This reaction is not disturbed by the presence of foreign substances such as albuminoids, and it is serviceable for demonstrating the presence of uric acid in the urine, in the blood or in the tissues.

Drug Assaying.

In connection with sending out a report on drug assaying presented at the last meeting of the Association of Official Agricultural Chemists, by Dr. Kebler, C. E. Parker calls attention to the fact that under the auspices of that association a systematic study of methods of drug assaying has been in progress for five years, the results being reported in the annual proceedings of the association, which are published as bulletins of the bureau of chemistry. This investigation is carried on under the general system of the association for improving specific branches of analysis, including articles of food, beverages, condiments, soils, fertilizers, etc. The usual method of procedure is to send out to competent analysts who volunteer to collaborate and who need not be members of the association, uniform samples of substances and detailed instructions in the methods by which the samples are to be analyzed. Collaborators are invited to submit with their analytical results any useful observations or criticisms arising from their experience. The individual reports are collated and tabulated by the referee, and made the basis of a report to the association, which includes recommendations for further procedure. This may involve the abandonment of unsatisfactory methods, with further trial of such as seem promising, possibly with the introduction of some modification which experience has indicated may be useful; if a method appears satisfactory it is recommended for adoption as a provisional method, which, after further successful probation, may be made official. The suggestion has appeared, says Mr. Parker, in view of the labor involved in collecting the data for the tests and assay methods of the Pharmacopœia, and the time which elapsed between the meeting of the last revision convention and the final publication of the work, that the committees having these functions should continue active in the interim between revisions. This idea may be utilized in the future, but no steps appear to have been taken to apply it to the advantage of the next revision. In the meantime, through the collaborators with the A. O. A. C. a body of information partially covering the same field is being accumulated and recorded where it will be available to the revision committee.

Bolivian Cinchona Barks.

In addition to a false cinchona bark, apparently cascarilla magnifolia, Hartwich (*Schweiz. Woch. Chem. Pharm.*) describes three true Bolivian cinchona barks, cinchona morada (5.48 per cent. of total alkaloids), cinchona anaranjada (3.65 per cent.) and cinchona canela (4.65 per cent.). The last named is distinguished by the presence of stone cells. With all three varieties a positive thalleoquin reaction is obtainable. On account of their low percentage of alkaloids, however, it is claimed that these barks cannot compete with the Javanese drug.

Mending Broken Pestles.

Case (*The Spatula*) suggests that when wooden pestle handles are broken off at the joint, repair may easily be made by boring a hole in the broken end, from $\frac{3}{4}$ to 1 inch deep, gluing in a cylindrical stick, cleaning out the hole in the wedgewood part and cementing in the handle with plaster.

"Hydrocyanate of Iron."

An examination of a preparation marketed under this name as a remedy for epilepsy hysteria, etc., is reported in the *Journal of the American Medical Association*. The term "hydrocyanate of iron," says the *Journal*, is "an unfamiliar one and was not to be found in any available reference work on chemistry. Thinking that the term might have been loosely applied to ferrocyanide of iron or Prussian blue (a compound once suggested for epilepsy, but long ago considered useless), the manufacturers were asked if such were the case. They replied that their preparation was 'not Prussian blue in any sense of the word,' and added that 'Prussian blue has no curative properties as applied to all forms of epilepsy.'" The preparation was then analyzed and from the analysis it is concluded that "hydrocyanate of iron" is essentially a mixture of approximately equal parts of talc and Prussian blue, containing traces of organic matter having the general properties of alkaloids. It may be noted that this iron product is marketed by the same company that puts out narkine, to which some reference is made in the *CIRCULAR* for September, 1908, page 412.

Stream Pollution.

Price and Stokes (*Journ. Am. Med. Asso.*) say that the pollution of streams by distillery waste is a comparatively recent problem since the concentration of the distilleries, due to changes in the trade, in the neighborhood of cities and in thickly settled communities has given rise to nuisances varying in extent according to the process employed and the size of the stream receiving the waste. The legal principles involved are fairly settled, but their application to this particular question is somewhat new. In the specific case referred to in this paper, the pollution of the Patapsco River, it was necessary to show the pollution and its cause, and the latter is of interest on account of the fungus to which it was found to be due. The species which caused an almost intolerable odor from the water of the river a short distance below the distillery and killed a large number of the fish, was found to be *leptomitus lacteus*, an alga belonging to the *saprolegniæ*, which is described and illustrated. When cultivated in vitro it quickly disappeared, which the authors attribute to its exhaustion of its own nutriment as well as to autointoxication by its own products. The cause of the death of the fishes was not ascertained by the examinations made.

The Red Line in Urine Testing.

Dawbarn (*Arch. Diagnosis*) suggests the cause of the presence of a red line sometimes developed by the contact of urine with cold nitric acid in testing for albumin. He has found the line present in every case of insufficient action of the liver, when there was present persistent constipation; or in women having either a subacute or chronic pelvic peritonitis or pyosalpinx, and with pus or other excrementitious material continually diluting the blood. The line is to be seen with or without the presence of the white line of coagulated albumin, in the former case being immediately above the albumin. He observed that in old people with retained fecal masses the red ring was invariably present. Upon their expulsion the red line would quickly disappear.

Fraudulent Nostrums for Drug Addictions.

Kebler in a paper presented at the recent meeting of the American Medical Association said that examinations made during the past few years by the United States department of agriculture had shown that preparations advertised for the treatment of drug addictions usually contained large quantities of the drug for which treatment was instituted. He cited examples in which he had found preparations containing as much as thirty-two grains of morphine to the fluid ounce. Sometimes they contained also atropine, strychnine, quinine, or other alkaloids. In some cases there was a gradual reduction in successive supplies of the preparation, but the reduction was so small as virtually to extend the treatment over years. In other cases the treatment was with packages serially numbered from one to ten, and each package was found to contain the same amount of the habit-forming drug. The books of some institutions showed that the treatment was intended to be continued indefinitely. These practices were exceedingly difficult to control, but the post-office department had been of the greatest assistance, and it was hoped that it would be successful in eliminating them entirely.

Colorimetric Test for Phosphates.

Pouget and Chouchak (*Bull. Soc. Chim. through School Mines Quart.*) suggest a test for phosphates, based on the fact that clouding and a more or less intense coloration result on the addition of a molybdate together with a solution of strychnine to a solution containing a phosphate. The depth and intensity of the color depend upon the relative proportions of the substances taking part in the reaction. The suggested reagent is prepared by adding to 10 c.c. (mils) of a 15-per cent. solution of sodium molybdate, 2.5 c.c. (mils) of nitric acid, and 1 c.c. (mil) of a cold saturated solution of strychnine sulphate; filtering if necessary. This mixture turns yellow on standing; although it may serve even when colored, for qualitative work, it should be freshly prepared when wanted for quantitative estimations. The solution to be tested should be acidified with nitric acid before adding the reagent; the reagent and the solution should be allowed to stand in contact for twenty or twenty-five minutes before the coloration is determined. The color may be compared with that obtained with solutions containing known amounts of phosphates. The authors say this test will detect 1 in 20 millions.

Influence of Sewers on Tuberculosis.

Kober (*Bull. Johns Hopkins Hosp.*) discusses the question of the influence of sewers and of general sanitation upon the prevalence of tuberculosis. He speaks first of the sources of tuberculous infection, considers the predisposing causes of this disease and then goes on to consider the influence of sewers on the prevalence of tuberculosis. He believes that the amount of polluted air resulting from improper sewage disposal by means of cesspools and other makeshifts is a large factor in preparing soil for this disease. He quotes statistics from certain cities where there has been a very large reduction in tuberculosis and other diseases after a proper sewage system has been established.

The Bleaching of Flour.

Flour is bleached commercially by nitrous oxide vapor. Ladd and Bassett (*Journ. Biol. Chem.*) have shown that nitrites or nitrates or nitrite-reacting or nitrate-reacting material are among the products formed, and that bread baked from the flour by the domestic method will contain from one-third to one-half the nitrite-reacting material found in it. The proportion of nitrates in the bread increases as the nitrites decrease, the proportion depending on the method of baking. The bleaching agent acts both on the fat and on the gluten of the flour. The gluten of the flour is less digestible than that of unbleached flour and the baked gluten or bread made from bleached flour shows a similar but smaller difference in digestibility. The experiments show that the process of bleaching is essentially different from the natural ageing of the flour.

Test for Antipyrin in Pyramidon.

Primot (*Bull. Sci. Pharmacol.*) describes a simple test for antipyrin in pyramidon, depending upon the fact that vanillin gives a yellow coloration with antipyrin, and not with pyramidon. In performing the test a small portion of the pyramidon is heated on a water-bath in a porcelain dish with 2 c.c. (mils) of a reagent composed of vanillin, 1 gramme; hydrochloric acid, 3 grammes; distilled water, 3 grammes; alcohol (95 per cent.), 100 grammes. If antipyrin be present a deep-orange residue is left in the capsule after evaporation, and if the operation be conducted slowly it is possible to detect an extremely small quantity by the production of a fleeting-yellow color. The delicacy of the test is reduced by the presence of pyramidon, but 0.005 gramme of antipyrin can easily be detected in 0.1 gramme of pyramidon.

A New Adrenalin Reaction.

Solution of adrenalin according to Fraenkel and Allers (*Biochem. Zeit. through Journ. Soc. Chem. Ind.*) when warmed with iodic acid or with potassium di-iodate and diluted phosphoric acid, gives a fine rose-red coloration, or an eosin-red color in the case of very dilute solutions. One part of adrenalin in 300,000 of solution can be detected by this reaction. In carrying out the test, the adrenalin solution is mixed with an equal volume of N/1000 potassium di-iodate solution and a few drops of diluted phosphoric acid, and heated to incipient boiling. The red color changes to brown on addition of ammonia. The red color reaction depends upon the addition of iodine to the adrenalin molecule, and the authors hope to base a quantitative method upon it. The reaction is characteristic of adrenalin.

New Method of Preparing Lemon Juice.

Stock (*Journ. Pharm. Chem. through Pharm. Journ.*) says that lemon juice is now prepared by centrifuging the pulp. It is stated that the juice so obtained is better in flavor, since none of the seeds are crushed, than when a press is used; it is also clearer. The residue is easier to handle than the press cake obtained by the older method. Centrifugation would probably be more convenient to work, and give better results with other fruits.

The Modern Materia Medica.

Agaroma, an agar-agar preparation introduced as a laxative in atonic constipation.

Anorrhæal suppositories are said to contain sodium sozoiodolate, extract of witch hazel, zinc oxide, alumnol, extract of suprarenal glands and glycerin. They are put forward as a remedy in hemorrhoids.

Antipon, an English preparation, advertised as an antifat remedy, is said to contain citric acid, benzoic acid, saccharin, oil of wintergreen and cochineal. *Antipon sweetening tablets* are said to contain an artificial sweetening product and are offered as a substitute for sugar in obesity.

Arsan is defined as arsen-glidin, containing about 4 per cent. of arsenic.

Bromural, mono-bromo-isovalerianyl urea, is put forward as a hypnotic.

Cholelysin siccum is advertised as a cholagogue, but consists, according to Zernik, almost entirely of powdered soap combined with 13 per cent. of albumin.

Corosana is a cod liver oil "preparation," in the form of sticks which are said to contain in addition to the oil, chocolate, lecithin, phosphoric acid and calcium phosphate.

Desalgin (colloidal chloroform), is an analgesic in powder form which represents 25 per cent. of chloroform combined with albumin. It is put forward for use in cases of gall stones, intestinal colic, asthma and catarrhal diseases of the bronchial tubes.

Gonyval is the isobornyl ester of isovalerianic acid. It forms a neutral liquid, possessing an agreeable taste and an odor less pronounced than most of the valerian preparations. It is proposed for use whenever valerian preparations are indicated.

Hygiopon is an iron preparation, made electrolytically. It forms a clear greenish-yellow liquid with an acid reaction and contains, according to Bischoff, 22 per cent. of ferrous chloride, 3.6 per cent. of ferric chloride, 2.8 per cent. of sodium chloride and 6.67 per cent. of free hydrochloric acid. The preparation has apparently no advantage over a ferrous chloride solution prepared in the regular way.

Ichmol. A greenish liquid recommended for toothache. It consists of an alcoholic solution of oil of cloves and other essential oils, colored green with chlorophyll.

Indoform, which was said to be salicylmethylene acetate, according to Frerichs, is not a chemical compound but a mixture of one part of salicylic acid and two parts of acetylsalicylic acid, with traces of formaldehyde and salicylic acid methylester.

Iodival is mono-iodo-valerianyl urea, $(\text{CH}_3)_2\text{CH}.\text{CH}.\text{CO}.\text{NHCONH}_2$. It is a white powder which is insoluble in cold water, but soluble in hot water, and alcohol. It contains 47 per cent. of iodine and is offered as a substitute for the iodides.

Leciferrin. A sweetened liquid which is said to contain 0.5 per cent. of ovo-lecithin and 0.3 per cent. of freshly precipitated ferric hydroxide. Zernik and Kuhn, however, could not verify this statement. It is exploited as an appetizer and regulator of digestion.

Leistner's Tablets, exploited for all cases of gastro-intestinal troubles, appear to contain nothing but powdered cascara sagrada bark.

Morphosan is morphine bromo-methylate. It forms white crystals, difficultly soluble in cold water, but easily soluble in hot water. It acts like morphine hydrochloride but is much weaker. It easily crystallizes out from aqueous solutions. The solutions turn brown on sterilizing.

Orundon. Two preparations, a liquid and a solid, are marketed under this name and recommended as antirheumatics and antineuralgics. According to Aufrecht the liquid contains as its chief constituents iodine, salicylic acid and piperazin, while the solid, which is also recommended for gout, contains urea, diuretin and the sulphates and carbonates of magnesium, lithium and sodium.

Ozonal and Sedlozon are trade-marked names for oxygen baths, produced by the action of sodium peroxide and sodium bicarbonate on water.

Phosrachit is a phosphoretted cod liver oil preserved by the addition of 1 per cent. of limonene and containing 0.01 per cent. of phosphorous.

Pixavon. An odorless liquid tar soap recommended as a scalp wash to prevent baldness of parasitic origin.

Succinol. A purified tar oil, obtained by the destructive distillation of amber. Put forward for use in pruritus, psoriasis, etc.

Trypanosan. A halogen substitute of fuchsine said to have a destructive action on trypanosomes.

Thiozone. Erdmann has shown that sulphur under certain conditions forms a compound analogous to ozone, called thiozone $\text{S}=\text{S}=\text{S}$. This substance has the property of adding itself to chains containing double bonds, especially when the double linkage is located at the end of the chain. Thus on treating linalylacetate with thiozone, the thiozonide is formed which reacts with sodium sulphide forming a thiozonidate—also called thiozone. This product, which is odorless, is said to have many advantages over organic sulphur compounds and is recommended in scabies, etc.

Valisan. A bromine compound of bornyval representing 25.2 per cent. of bromine. It is put forward as a sedative.

Emulsion of Fat for Use in Diabetes.

Rochaix according to the *Journal de médecine de Paris* (through *N. Y. Med. Journ.*) employs the following emulsion of fats in the treatment of diabetes:

Oil of peppermint.....	6 drops.
Oil of lemon.....	6 drops.
Medicinal soap (freshly prepared) ..	½ dram.
Cherry laurel water.....	5 drams.
Orange flower water.....	2½ ounces.
Saccharin	3 grains.
Olive oil (or sesame oil) enough to make.....	16 ounces.

Quinine as a Poison.

A case of death following an overdose of quinine is reported from England. The subject was a woman 36 years old. She took, it was stated, 25 grains. Autopsy showed congestion of the brain, liver and lungs. The coroner believed that this had been brought about by the quinine.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Omission of the Apostrophe from the Title of this Publication.—F. O. C., New York.—At first (January, 1857) the title of this publication was AMERICAN DRUGGISTS' CIRCULAR AND CHEMICAL GAZETTE. In January, 1866, it became THE DRUGGISTS' CIRCULAR AND CHEMICAL GAZETTE. The apostrophe was first omitted from its name in December, 1877, while Dr. Newton was still its editor and proprietor, and the title then remained THE DRUGGISTS CIRCULAR AND CHEMICAL GAZETTE until January, 1907, when it was changed to its present form. We have heard that Dr. Newton dropped the apostrophe in order that the title when set in large type, as on the cover page, would make a more symmetrical line. That there was good precedent for his action is shown by the exclamation, "For goodness sake!" the possessive case for "goodness" evidently being meant, but the apostrophe being omitted in this case for the sake of the tongue and ear instead of the eye.

Selling Cigars on Sunday as Drugs.—W. H. L., Ontario, seeks information regarding the right of a druggist to sell cigars as drugs on Sunday. He has heard that this right has been established in a number of the States through litigation and would like to hear of the particulars.

We have known druggists who positively refused to sell cigars on Sunday, and we have known of prescriptions having been written for cigars by physicians and filled on Sunday, but we do not recall any case in which the rights of the druggist in the matter have been determined by the courts. If anyone knows of such a case we hope he will send us an account of it.

Stokes' Liniment.—J. E. K., Indiana, wants a formula for a "liniment with eggs, turpentine, vinegar, spirits and oil of some nature, that will make a nice, light-colored mixture." He gives a fairly accurate description of the acetic turpentine liniment of the National Formulary, known also as Stokes' liniment and St. John Long's liniment, and we suspect that the formula for this is what he is after.

Compound Elixir of Glycerophosphates without Sugar.—W. S. T., New Jersey.—We do not know just what you mean by "elix. glycerophos. comp.," but suspect you have in mind the preparation of the National Formulary, which, while having no "compound" in its official title, could really be classed as a compound elixir. The only sugar in this preparation is that introduced with the aromatic elixir which is one of its ingredients, and we fancy that an "aromatic elixir" might be made with glycerin in place of syrup, and used in the manufacture of elixir of glycerophosphates. Of course, however, the latter would then not be official and it would be unlawful under the New Jersey food and drugs act for it to be sold under an official name.

A Home-Made Device for Continuous Filtration.—"A Reader," Massachusetts, favors us with the drawing shown herewith. In the device the filter is a piece of muslin tied over the mouth of an ordinary flower pot. In the aperture in the bottom of the pot is inserted a perforated cork through which has been run a section of glass tubing. Attached to the outside end of the glass tubing is a rubber tube to be used as a siphon. The other end of the siphoning tube connects with a bottle, placed at a suitable height, containing the liquid to be filtered. The adjustment of the inverted flower pot into a funnel, and the support of the latter by the bottle into which the filtrate is to pass, are clearly indicated by the drawing.

Funnel and Siphon for Continuous Filtration.

The flow of liquid having been started, it will continue just as fast as the liquid passes through the filter, but, of course, no faster, so long as the other end of the siphoning tube is kept in the liquid and at a greater height than the filter.

If desirable, cotton or sand or other filtering mediums could be used in place of, or in conjunction with, the muslin.

Essence of Pepsin.—J. K. H., North Carolina.—This is an official (N. F.) preparation. In North Carolina it is unlawful to sell as and for an official preparation one which is not of official strength, quality and purity, unless the deviation from the official standard is plainly indicated.

A number of formulas for essences of pepsin other than the official, or notes on the subject, may be found in the volume of the CIRCULAR for 1906, in the numbers for June, page 204; July, page 249; August, page 295; and November, pages 392 and 393.

Compound Solution of Hypophosphites without Sugar.—W. S. T., New Jersey.—The official (N. F.) compound solution of hypophosphites contains no sugar.

Barbers' Sea Foam and Shampoo.—F. G., California.—From one to half-a-dozen or more formulas for shampoos and preparations of this nature are given in each of the following numbers of the CIRCULAR: For 1908—January, page 23; March, page 119; and July, page 324. For 1907—July, page 473. For 1906—May, page 162; July, page 241; and October, page 363. For 1905—August, page 280. Sea foam is just a fanciful name for a shampoo preparation.

Perhaps one of the following formulas will give you an idea which you may utilize in making what you want:

I.	
Potassium carbonate.....	½ ounce.
Powdered castile soap.....	1 ounce.
Water	8 ounces.
Oil of bay.....	5 minims.
Alcohol.....	enough to make 1 pint.

II.	
Powdered castile soap.....	14 ounces.
Potassium carbonate.....	3½ ounces.
Water	28 ounces.
Glycerin	7 ounces.
Oil of lavender.....	30 minims.
Oil of bergamot.....	30 minims.
Perfume	enough.

Mix the first three ingredients and allow them to stand overnight. Then stir well together, heating gently, to make a homogeneous mixture, and add the others.

The product will be in the form of a paste, which may be dissolved in a mixture of 1 pint of alcohol and 7 pints of water.

Eggs of Pharaoh's Serpents.—D. A. L., Pennsylvania.—The toy referred to may be made of comparatively harmless material by the following formula:

Potassium dichromate.....	2 parts.
Potassium nitrate.....	1 part.
White sugar.....	2 parts.

Pulverize each ingredient separately, and mix thoroughly. Make small paper cones and press the mixture into them. They must be kept from light and moisture.

Sometimes they are made of mercurous sulphocyanate, HgCyS, a white precipitate formed by adding mercurous nitrate to a dilute solution of potassium sulphocyanate. The substance is a violent poison, and the fumes when it is heated are of course dangerous. The "eggs" have been eaten by children, who supposed them to be candy.

Moxie.—S. A. C., New York.—We do not know how this beverage is made, but have seen a statement to the effect that it was prepared from oats (*avena sativa*) and flavored with sassafras and wintergreen; although it is claimed by the manufacturers that it comes from a South American cane.

In expressing his opinion upon "valid evidence" and similar topics during the suit of the Moxie company versus the Modox company, Judge Brown in the United States circuit court, at Providence, R. I., had this to say a couple of years or so ago about the mystical origin of the name occasioning this contest: "The evidence raises serious doubts as to Lieut. Moxie, the discoverer. The existence of Lieut. Moxie

can hardly be regarded as a trade secret. No one but Dr. Thompson seems to have known about him, so far as this record discloses. But wherever Dr. Thompson may have found the name 'Moxie,' there remains a strong suspicion that Lieut. Moxie got his name from Dr. Thompson."

Several years ago we printed a formula for a preparation said to resemble moxie, which is as follows:

Oil of sassafras.....	15 minims.
Oil of wintergreen.....	15 minims.
Alcohol	1 ounce.
Fluidextract of gentian.....	1 ounce.
Compound syrup of sarsaparilla....	8 ounces.
Caramel	1 ounce.
Syrup.....	enough to make 5 pints.

Inflammability of Mixtures of Kerosene and Carbon Tetrachloride.—F. O. C., New York, asks, "What proportion of tetrachloride of carbon is necessary to render kerosene non-combustible?"

This query was referred to our good friend, Otto Raubenheimer, the "kerosene, benzin, naphtha, gasoline and carbon tetrachloride expert," who reports as follows:

If by "non-combustible" your subscriber means "non-burnable" then my answer will be that 99 per cent. of carbon tetrachloride is required. If on the other hand your subscriber wishes a mixture which is intended to be safer than kerosene itself, then I would suggest a mixture of equal volumes—not parts by weight—of kerosene and carbon tetrachloride. This will produce a mixture which will not ignite at ordinary temperature, or even in this hot temperature of 100° F. of to-day, and will be non-explosive—in other words, which will be perfectly safe.

It would be well to submit such a mixture to our bureau of combustibles, which makes so many laws and ordinances regarding the sale of such mixtures as insecticides, and get the opinion of the bureau on such a mixture.

This is about all I care to write on this subject in this hot weather, but when it gets cooler then I will give you readers more information on CCl₄ mixtures, as such information seems to be needed very much, judging from the many inquiries in your and other journals, although I have written a number of papers and answered a great many queries on that subject since May 10th, 1903.

We feel sure that F. O. C. and many of our other readers join us in thanking Mr. Raubenheimer for this note, as well as in looking forward with pleasure to the greater amount of information on the subject which he promises when the weather gets somewhat more frosty.

Hydrous Wool Fat in Resorcin Ointment.—F. M. Stage, New York, referring to the note in the CIRCULAR for last month, page 345, on the reason for the use of the hydrous rather than the anhydrous wool fat as a base for compound resorcin ointment, says:

I seem to get in on this compound resorcin ointment business all right. You say that a member of the committee simply found it all right. Now, I will tell you the reason it was used; or at least the reason why it should be used. The resorcin is very soluble in the 30 per cent. of water the hydrous wool fat contains. The resorcin should be thoroughly powdered and added first and the other ingredients of the ointment later. If you will only change the paraffin to white wax you will have an excellent preparation.

We thank Mr. Stage for this additional evidence of his friendship for us and interest in our readers, and trust that he will continue to favor us with occasional notes.

Kutnow's Powder.—In applying in England for registration for the name "effervescent Carlsbad powder," as a trade-mark, the proprietors of Kutnow's powder represented their product as being made from the genuine Carlsbad salts, improved by the addition of chemicals to make it effervescent, etc. In England the powder is known as "Kutnow's improved effervescent Carlsbad powder." The city of Carlsbad successfully opposed the registration in this country of the word "Carlsbad" in connection with the name of the powder.

The salts of the Carlsbad sprudel water according to Göttl (United States Dispensatory, fifteenth edition, page 1847) are:

In each pint—

Sodium carbonate.....	9.062 grains.
Magnesium carbonate.....	0.399 grain.
Ferrous carbonate.....	0.031 grain.
Calcium carbonate.....	2.020 grains.
Sodium chloride.....	8.724 grains.
Potassium sulphate.....	0.370 grain.
Sodium sulphate.....	19.960 grains.
Aluminum phosphate.....	0.215 grain.
Silica	1.052 grains.

Total 41.833 grains.

The National Formulary contains formulas for artificial Carlsbad salts—dry, crystalline and effervescent.

Otto Raubenheimer, New York, who specializes in formulas and book information, writes us that according to Hahn-Holfert-Arends, this powder consists of sodium and potassium sulphates, and calcium, lithium and strontium carbonates.

Interesting articles on Kutnow's powder were published in issues of the *Journal of the American Medical Association* for October 21st, 1905, and August 31st, 1907, and have been reprinted in the association's little book on the Propaganda for Reform in Proprietary Medicines. This booklet, by the way, should be in the hands of every druggist in the land. It is published by the American Medical Association, 103 Dearborn street, Chicago, and a single copy will be mailed, postpaid, for 10 cents in stamps. Any druggist who is induced by this notice to send for a copy of the booklet and does not think it worth the 12 cents that it cost him to get it, may send to us for a refund of his 14 cents.

Deterioration of Iodoform Ointment.—B. S. G., New York, has trouble with his iodoform ointment which, he says, "darkens and becomes granular," "although both the iodoform and the lard are O. K." He asks for help. Iodoform in contact with fatty substances is slowly decomposed into iodine and methylene iodide, the decomposition being hastened by the rancidity of the fat and by exposure to light. From this it is quite simple to deduce a method of prophylaxis.

In the first place the lard should be the U. S. P. article, and few pork-fats of the market approach within hailing distance of that standard. To be sure of getting the best the druggist should melt, filter and wash his lard, and free it from excess moisture. The iodoform should be in the form of the finest possible powder, and the finished product should be kept in light-proof, clean containers.

Heaves in Horses.—E. F. F., New Jersey.—We do not know the composition of the proprietary remedy or "cure" for heaves in horses that you mention. If it is labeled as a "cure" it is possible that its manufacturer will be dealt with by the United States government for misbranding, as it has been ruled in some cases that the use of this word on a label constitutes that offense.

We have often advised druggists to avail themselves of the books and pamphlets on subjects germane to their calling issued by the United States government, some of which are sent free for the asking and others of which are sold for a nominal price. One such book is called *Diseases of the Horse* and was issued in revised form in 1907. It is by expert veterinarians, is well printed, illustrated and bound, and would probably sell for two or three dollars if published in the usual way. We believe it may be obtained from the superintendent of documents, at Washington, for about 65 or 75 cents. Nearly a million copies of it have been printed, the present edition of 250,000 having been ordered issued by congress to meet the continual demand for the book.

Speaking of heaves, this book says: "When the disease is established there is no cure for it." It goes on to tell what should be done in the way of feeding and other attention for horses suffering from this trouble, and also exposes some of the tricks of horsemen who try to conceal the disease when it is present in any of their animals. We quote a few passages:

Proper attention paid to the diet will relieve the distressing symptoms to a certain extent, but they will undoubtedly reappear in their intensity the first time the animal overloads the stomach or is allowed food of bad quality. Clover hay or bulky food which contains but little nutriment have much to do with the cause of the disease, and therefore should be entirely omitted when the animal is affected, as well as before. It has been asserted that the disease is unknown where clover hay is never used. The diet should be confined to food of the best quality and in the smallest quantity. The bad effect of moldy or dusty hay, fodder, or food of any kind can not be over-estimated. A small quantity of the best hay once a day is sufficient. This should be cut and dampened. The animal should invariably be watered before feeding; never directly after a meal. The animal should not be worked immediately after a meal. Exertion, when the stomach is full, invariably aggravates the symptoms. Turning on pasture gives relief. Carrots, potatoes, or turnips chopped and mixed with oats or corn are a good diet. Half a pint to a pint of thick, dark molasses with each feed is useful.

Arsenic is efficacious in palliating the symptoms. It is best administered in the form of the solution of arsenic, as Fowler's solution or as the white powdered arsenious acid. Of the former the dose is 1 ounce to the drinking water three times daily. Of the latter one may give 3 grains in each feed. These quantities may be cautiously increased as the animal becomes accustomed to the drug. If the bowels do not act regularly, a pint of raw linseed oil may be given once or twice a month, or a handful of Glauber's salt may be given in the feed twice daily, so long as necessary. It must, however, be borne in mind that all medical treatment is of secondary consideration; careful attention paid to the diet is of greatest importance. Broken-winded animals should not be used for breeding purposes. A predisposition to the disease may be inherited.

While on the subject of books on diseases of animals we might mention a handy little volume entitled *Veterinary Counter Practice*, published by the *Chemist and Druggist*, London, and sold in this city by McKesson & Robbins for \$1.75. In it are given descriptions of diseases of horses, cattle, sheep, pigs, dogs, and poultry, with suggestions for their treatment. In mentioning this book we waive for the time being the

question of the propriety of druggists' engaging in counter practice even on the lower animals.

A further note on this subject, with some formulas, may be seen in the CIRCULAR for April, 1907, page 309.

Using Denatured and Wood Alcohol.—C. A., Massachusetts, writes:

Will you kindly let me know, if possible, through the next issue of THE DRUGGISTS CIRCULAR, how to deodorize denatured and wood alcohol, and if diluted denatured or wood alcohol will have the same effects on the face after shaving as diluted grain alcohol? If it has not, what other effects has it got?

This request seems to show that its writer is laboring under a serious misapprehension as to the legitimate uses to which denatured alcohol may be put, and as to the proper sphere of wood alcohol.

Denatured alcohol is grain alcohol to which has been added some substance (consisting in large part of wood alcohol) which is intended to make it unfit for medicinal use, and the law expressly says that such alcohol must not be used in the manufacture of liquid medicinal preparations. Except under certain very rigid conditions the adding to or taking from denatured alcohol of anything is forbidden. Those who handle denatured alcohol should obtain from the United States internal revenue collector for their respective districts circulars giving full information as to what their privileges are. Notes on this subject of particular interest to druggists are given in the CIRCULAR from time to time as they are made public at Washington.

In discussing the use of wood alcohol in toilet preparations we can do no better than to quote a few strong words on the subject which have already appeared in the CIRCULAR, credited to *Merck's Report*. Says that paper: "We cannot too strongly condemn the use of wood alcohol in any preparation whatever, intended for use either externally or internally. Numerous experiments and observations have shown that wood alcohol is exceedingly dangerous to the human being. Even small doses have repeatedly been known to cause partial to absolutely total blindness, and like results have been seen in cases where a person has been exposed only to the vapors of wood alcohol."

Nail Polishes.—McC., New York.—We do not know how the particular polish you name is made, but in a general way it may be said that such preparations are composed essentially of tin oleate, or of some slightly abrasive powder, as pumice, or infusorial earth, in the finest possible state of subdivision. If the polish is to be exhibited in the shape of a paste, a wax or petrolatum base may be used. Carmine may be added for its color.

We have known barium sulphate, calcined magnesnia, and the oleo-stearate of zinc (N. F.) each to be used as a nail polish.

The continued employment of nail polishes, as has often been pointed out in the CIRCULAR and elsewhere, is likely to result disastrously to the one employing them.

Further notes on this subject, with formulas, may be seen in the CIRCULAR for December, 1908, page 617; for March, 1908, page 131; for July, 1907, page 475; and for January, 1905, page 17.

Honey and Almond Cream without Almonds.—F. M., Illinois.—For a long time it was said that a widely-advertised "honey and almond cream" contained no honey. Whether the formula has been changed since the passage of the food and drugs act prohibiting misbranding, we have not been advised. Now, if we also omit the almonds, there will be little left by which to identify the product.

In the CIRCULAR for April there is a formula for a "honey and almond lotion" containing no honey, and it would be a simple and by no means a fatal matter to omit the oils of almonds designated in that formula and use in their places some other oil.

Perhaps one of the formulas given below will afford you a basis for further experiment:

Crème Simon à la Glycerine, an application for redness of the skin, blackheads, etc., consists, according to Koller, of a mixture of zinc oxide, glycerin, and talc, scented with a little patchouly oil.

Eau de Naples is put down by the same authority as being a mixture of 12 parts of borax, 100 parts of distilled water, 50 parts of rose water, 1 part of camphor, and 4 parts of tincture of benzoin.

Glycerin Balm for the Skin.

Powdered starch.....	½ ounce.
Water	1 ounce.
Glycerin	1 ounce.
Bay rum.....	2 drams.
Oil of bergamot.....	8 drops.
Oil of rose geranium.....	2 drops.
Extract of jockey club.....	2 drams.

The starch, water and glycerin must be mixed over a gentle heat, with constant stirring, and the other ingredients added. A touch of color may be given to the cosmetic by the addition of a little carmine.

Experimenting with a "greaseless" lotion of the stearate type, we have succeeded in obtaining a presentable product. First we made a base, so:

Stearic acid.....	3 ounces.
Dried sodium carbonate.....	80 grains.
Sodium borate.....	64 grains.
Glycerin	3 ounces.
Expressed oil of almonds.....	6 drams.
Water	13 ounces.

Dissolve the sodium salts in a mixture of the glycerin and the water, heating gently. Melt together the stearic acid and the oil on a water bath. Having the two liquids at the same temperature, about 90° C., pour the solution of the sodium salts into the mixture of oil and acid, gradually, stirring the while. Heat the mixture on a water-bath, stirring at frequent intervals, until effervescence ceases—about half an hour. Remove from the bath and beat until cool.

The Lotion.

Stearate base.....	10 ounces.
Glycerin	10 ounces.
Mucilage of quince seed (1 to 50) ..	25 ounces.
Bitter almond water.....	20 ounces.
Rose water.....	6 ounces.
Water.....	enough to make 100 ounces.

Triturate the base in a cold mortar with the mucilage, gradually added; continuing the trituration, add the glycerin and the aromatic waters; transfer the mixture to a bottle, and add in divided portions, agitating after each addition, enough water to make 100 ounces.

Good Sink Material.—E. W. Fellows, New York, seems to have solved the sink problem to his own eminent satisfaction. In reply to a request in last month's CIRCULAR, page 349, for views on the subject of the best material out of which to construct a sink in the pharmacy, he writes:

In the July CIRCULAR our friend M. G. S. is evidently up against it on the sink question. At least he wants information as to the "best" kind of a sink to be used in a pharmacy.

Unfortunately there is no official sink. The United States Pharmacopœia calmly steps from *sinapis nigra* to *sodii acetat* with no mention of *sinkum penstockana*—its properties, habitat, tests of purity, etc. And the National Formulary leaves the pharmacist in the same boat.

Now, it is obvious that there may be as many different kinds of sinks as there are permanent metallic elements in chemistry, varieties of tile in pottery, or suitable stone in mineralogy. From the glassmaker's standpoint the cast-iron sink is ideal. A good lusty iron sink, with the assistance of a new boy will, in a week, smash q. s. soda glassware to pay for the sink. Then there is the steel sink "galvanized"—a delusion and a snare! Good as long as the zinc coating lasts, which is about ten days of ordinary drug store usage. The porcelain sink is clean and attractive, but suggests a bath tub. The store "kid" may use it as such with the result of a contrb. neg. claim oy his parents against the druggist for drowning.

But what is the best sink? One made of platinum, of course. Have it made very heavy to prevent sneak thieves from carrying it off, or better still, arrange it so it can be disconnected at night and placed in the store safe. A good, well-made platinum sink will last a life time, and when finally worn out can be converted into city real estate, or used to lift the mortgage from the store.

In reply to our request for a brief disquisition on the philology of the word "penstockana," Mr. Fellows writes: "When doing laboratory work at college our class referred to water by two generic names, *aqua destillata*, and *aqua penstockana*, the latter term referring to Hudson River water in its natural state (H_2O plus). *Penstockana* is a scholarly (?) derivative from *penstock*, a flume, or pipe used to convey water." He added that maybe we had better blue-pencil it. Perhaps in this he was right, but as a new, fine, large-sounding and ear-satisfying word it seems to fill the bill so well that we haven't the heart to kill it.

Incompatibility of Salol and Monobromated Camphor.—W. A. E., Virginia, submits for criticism the following prescription, the ingredients of which, it is claimed by the prescriber, can be combined in a powder:

Phenacetin	12 grains.
Acetanilide	9 grains.
Salol	15 grains.
Citrated caffeine.....	6 grains.
Monobromated camphor.....	6 grains.
Strychnine sulphate.....	1/10 grain.

Mix, and make 6 capsules.

Without the addition of a considerable amount of powdered elm bark, or althea, or some other inert absorbent powder it is not possible to combine phenyl salicylate and monobromated camphor without liquefaction taking place. The several other coal-tar products present in the mixture under discussion, favor rather than inhibit the characteristic result of the admixture of these two substances.

After experiments with the prescription in question we cannot concur in the quoted opinion of the writer thereof.

Meat Preservatives.—H. F. H., New York, writes: "Kindly advise me through your CIRCULAR if you have a formula similar to 'freeze 'em pickle' for preserving meats, etc."

We have no knowledge of the particular formula in question, but in the CIRCULAR for July, 1906, page 254, appears a note on this subject, which we reproduce herewith entire:

Prof. Matthes and Dr. Müller (*Pharm. Centralh.*), have examined a number of the newer meat preserving salts and found them to have the following compositions:

Eminent is a sausage spice-salt mixture consisting of about 85 per cent. of table salt, 5 per cent. of sugar, 5 per cent. of saltpeter and 5 per cent. of spices (mainly pepper).

Nova preservative crystals for chopped meat is composed of technically pure sodium acetate.

Zeolith contains approximately 16.4 per cent. of water, 0.4 per cent. of sodium fluoride, 15 per cent. of dried sodium phosphate, 50 per cent. of sodium chloride and 17 per cent. of sodium acetate.

Es ist erreicht consists of table salt and sodium phosphate, with a little saltpeter.

Preserving salt, Heidrich is composed of sodium benzoate, table salt and a small quantity of saltpeter.

Preserving salt, Keppler has about the same composition.

Preserving salt, Zugl consists of sodium benzoate, sodium phosphate and sodium chloride, together with traces of saltpeter.

Brilliant preserving salt contains aluminum sulphate, sodium benzoate and sodium phosphate.

Cassalin consists of sugar, table salt, sodium phosphate, sodium benzoate and aluminum sulphate.

In the CIRCULAR for November, 1907, page 733, in answer to a query from Canada concerning *preservaline*, we said:

In the Yearbook of the Department of Agriculture for 1900, W. D. Bigelow, then assistant in charge of food investigations, division of chemistry, now sometime acting chief of the bureau, published a treatise on "The Use and Abuse of Food Preservatives," in which he had a good deal to say about the composition of the various preparations then on the market known under the general name *preservaline*.

In his article the author (speaking generally and not with particular reference to the preparation now under discussion), used the following language:

In using preservatives of unknown composition, reliable and well-meaning food manufacturers may unknowingly commit two wrongs: (1) They may add to their products a compound of markedly toxic properties; (2) they may violate the law. Dependence cannot be placed on the claims of dealers. Representations of wholesomeness are worthless, because they accompany every food preservative. The statement that a given preservative may be used according to directions without violating the provisions of any pure food law is always false. All claims of new discoveries and exceptional preserving power are without foundation. In this category should be placed those preservatives which by name, trade-mark and advertising matter are represented as having the same effect on food as ice, differing only in the temperature produced.

It should be noted that these remarks were made before the passage of the food and drugs act of June 30th, 1906, and therefore, also, before the enactment of the various State laws based on that act. The statutes are much more rigid now than they were in 1900. It is quite possible, too, that the composition of some of the proprietary preservatives has also undergone a change in the meantime.

Forming a portion of the food chemist's article is a list of a hundred or so preparations offered through the trade as food preservatives, with reports of analyses of these. Over two dozen kinds of *preservalines* are mentioned, all made by the same company. Each one of these was found to contain one or more of the following ingredients: borax, salt, saltpeter, boric acid, ammonium fluoride, salicylic acid, sodium benzoate, formaldehyde, sodium sulphite, and sodium sulphate. As formaldehyde is particularly dangerous when used in foods, it may be well here to point out and emphasize the fact that it was found to be present to the extent of 10 per cent. in "preservaline No. 2," and in "milk sweet"; while a smaller percentage was found in "M preservaline." Some infor-

mation as to the estimation in which borax and other borates are held as food preservatives is given on page 722 of this issue [that is the issue for November, 1907].

We are not very familiar with the pure food laws of Canada, but in "the States" such preparations as are here-in mentioned are very good things, if used indiscriminately in foodstuffs, to get a man into embarrassing complications with the courts.

Perhaps sodium benzoate is as little objectionable as any of the chemicals used in preserving syrups, jams, jellies, etc., but the old-fashioned and honest sugar and heat, with or without studied sterilization, we can unqualifiedly recommend.

It will be noted that especial reference is made in the foregoing to preparations so named as to suggest that they have an effect on food similar to that produced by ice.

Quinine Sulphate and Solution of Ammonium Acetate.—J. L. H., Virginia, writes that he put up the following prescription:

Quinine sulphate.....	112 grains.
Magnesium sulphate.....	2 drams.
Solution of ammonium acetate....	2 ounces.
Acetic acid.....	enough.
Camphor water.....	enough to make 4 ounces.

Mix; Direct: Two teaspoonfuls in water every four hours.

He asks: "Please note how you would dispense this; and why is the acetic acid added?"

When quinine sulphate and the solution of an acetate are mixed there is formed the slightly soluble quinine acetate. The amount in this instance, due to the large quantity of quinine-sulphate directed, is such as to cause the mixture to form a thick, pasty mass.

Quinine acetate, like the sulphate, is quite soluble in diluted solutions of mineral acids; acetic acid, however, does not assist so well in dissolving it—that evidently being the purpose of its presence—and to dissolve the quantity in this mixture so much is required that almost no camphor water is needed to make the directed volume.

Our querist does not say how he filled the prescription. We should not put it up without first calling the attention of the prescriber to the large quantity of acetic acid present in the finished product.

Polish for Brass.—G. A. E., Massachusetts.—Fourteen formulas for metal polishes—powders, pastes and liquids—appear in the CIRCULAR for October, 1908, page 470. One of them follows:

Prepared chalk.....	8 ounces.
Oil of turpentine.....	2 ounces.
Alcohol.....	1 ounce.
Ammonia water.....	2 drams.

Benzin and Acacia for Bronzing.—I. S., New York, asks how "to mix benzin and gum arabic for bronze liquids." We do not know. Can someone tell us? Is it ever done?

Validol.—S. A. R., Iowa.—In the CIRCULAR for October, 1905, page 352, appears the following note:

Validol is defined as valerianic acid menthyl ester or menthol valerianate, $C_{10}H_{18}O_2$, to which 30 per cent. of free menthol has been added. It occurs as a thick, colorless, clear liquid, of mild, pleasant odor, and cooling, slightly bitter taste. It is used as a nerve sedative, analgesic and carminative, in hysteria, gastralgia, seasickness, syncope, etc. Dose 10 to 20 drops, on sugar or in

capsules. Camphorated validol is a 10 per cent. solution of camphor in validol, used in debilitated conditions as a stimulant, and as a dental anodyne in toothache from carious teeth.

This note and some thousands of others of a similar nature on other new remedies, we collected and printed in a small book in 1906.

Validol is also described in the current issues of the dispensatories and in the American Medical Association's New and Nonofficial Remedies.

Anonymous Queries.—"Subscriber," New Jersey; and H. A. H., Massachusetts.—We do not answer anonymous queries, a standing notice to that effect appearing at the head of this department. This notice is repeated nearly every month, just as it is repeated here now, and occasionally we go into details and explain why the rule was made.

Blair's Gout and Rheumatic Pills.—H. R. L., New Jersey.—We do not know the composition of these pills. Many years ago the *New Idea* said that they were made of acetic extract of colchicum and extract of hyoscyamus. You will find a reference to this fact in the CIRCULAR for March, 1895, page 62.

Appeals to Readers.—Information is sought concerning the composition of the preparations listed below. We ask for such help as our readers can give:

Aubry Sisters' Complexion Paste.—R. W. B., Florida.

Frutina.—J. E. D., Quebec.

Fitch Hair Tonic.—F. J. K., Washington.

Cockle's Pills.—S. A. K., Pennsylvania.

Champion Jewelry Wash.—D. I. C., New Jersey.

Pustolene (a dental paste).—J. E., Pennsylvania.

Crème Mealys.—L. A. K., New York.

Mimeograph Ink.

Balsam copaiba.....	9 ounces.
Lamp black.....	3 ounces.
Indigo.....	5 drams.
Prussian blue.....	5 drams.
Indian red.....	6 drams.
Yellow soap, dried and powdered,	2 to 3 ounces.
Rub well together until a smooth, creamy paste results.	

Marking Paste for Laundry Use.

The following formula (*Neu. Erfind.*) is offered for a marking ink for laundry use:

Copper sulphate.....	2 parts.
Anilin hydrochloride.....	3 parts.
Dextrin.....	1 part.
Glycerin.....	enough to make a paste.
Mix well, and put up in tin boxes.	

To Remove Stains from Marble.

Soft soap.....	4 ounces.
Whiting.....	4 ounces.
Sodium carbonate.....	1 ounce.
Water.....	enough.

Make a thin paste, apply it on the soiled surface, and wash it off after twenty-four hours.

Georgia Board Questions.

Herewith are printed the questions used by the Georgia Board of Pharmacy at an examination held November 9th, 1908. Other sets of questions asked by this board in recent years appear in the CIRCULAR for June, 1904, page 125; February, 1906, page 60; and July, 1907, page 481.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give to our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Pharmacy.

C. D. Jordan, Examiner.

1. (a) How much Iodide of Potash in a four ounce saturated solution? (b) State quantity of water used in making the above solution.
2. (a) What official product was formerly known as Cresylic Acid? (b) It is separated by fractional distillation from what? (c) It is nearly always employed in combination with what?
3. (a) To what does Cinnamomum Zeylanicum owe its virtue? (b) Mention some of the other principals present. (c) What often causes the F. E. to gelatinize?
4. (a) What official drug is known as Spurred Rye? (b) What is best solvent for its active principals?
5. (a) Mention four official products derived from the class Mammalia. (b) The principal use of each. (c) Which of the new official products of the above class is used principally as a haemostatic.
6. (a) What are ptomaines, their source? (b) What relation do they bear to alkaloids?
7. (a) The monacetyl derivative of aniline is officially known as what? (b) Its medical application is similar with what?
8. (a) What percent of Ammonium Acetate does Spirits of Mindererus contain? (b) Into what official liquor does it enter? (c) In the manufacture of this product why should it not be alkaline?
9. (a) Aluminum is found in combination with what acid? (b) Mention two official salts of this metal. (c) Which is its most important salt?
10. What two official pills is soap used as the excipient?

Chemistry.

R. H. Land, Jr., Examiner.

1. Define the following Chemical terms, Atom, Molecule, Base, Acid?
2. What is the difference between Sulphuric Acid and Sulphuric Anhydride?
3. Why is Lead often an impurity in Sulphuric Acid?
4. Define a saturated solution of a Salt in water?
5. Describe the meaning of the following prefixes and give an example of a U. S. P. Chemical of each? Bi, Hypo, Pyro, Sub?
6. Does Ferric Hydroxide act as an antidote for Arsenic?
7. How is Ferric Hydroxide prepared?
8. Why must Granular Effervescent Salts or Powders be kept in well corked containers?
9. Why is it best not to use an iron spatula in making an ointment containing Tannic Acid?
10. Name a chemical antidote for the following, Chloral, Alkalies, Acids, Iodine?

Materia Medica.

S. E. Bayne, Examiner.

1. What Constitutes "underground organs" in plant drugs? (a) Give official example of each.
2. State the difference between Hops and Lupulin. (a) Describe appearance and give dose of each.
3. What are the constituents of Squill? (a) Which is the emetic principle?
4. What is Morphine-diacetic-ester? (a) It's dose? (b) The limit to the fluid ounce prescribed in the Georgia narcotic law.
5. What single Bacterial product is official? Two doses are given by the U. S. P.—State them. (b) Give dose of Extract Thyroid Glands.

6. Mention five alkaloidal drugs which the U. S. P. require to be assayed. (a) Give assay strength of each.

7. Turpentine—Give official definition and description. (a) What is the U. S. P. title of the distilled preparations of Turpentine? (b) Dose.

8. What three Metals produce the greatest number of official preparations. (a) Name the principle preparation of each, and give dose.

9. What is Adrenalin? (a) Its common preparation, and general use.

10. Give habitat of Gelsemium. (a) Active principle of Physostigma. (b) Common name for Frangula. (c) Botanical name of Leptandra. (d) Give an example of Hepatic Stimulant; Cardiac Sedative.

Prescriptions and Doses.

Herman C. Shuptrine, Examiner.

1. State how you would fill the following prescription, give the appearance of the finished product, what would you do with it, and, why?

R Pot. Chlor..... 3 iv.
Glycerine 3 ss.
Tr. Ferri Chlor..... 3 ss.
Aqua q. s..... 3 iv.
M. Sig. Use as gargle.

2. Criticise the following prescription:

R Sod. Thiosulphate..... 3 iv.
Sod. Chlor..... 3 ss.
Acid, Hydrochloric..... 3 i.
Aqua q. s..... 3 iv.
M. 3i. t. i. d.

3. How much Corrosive Sublimate is there in a teaspoonful of a 1-2000 solution? How much Water would you add to make it a 1-2500?

4. Give the Official Latin Titles of the following: (a) Easton's Syrup. (b) Carron Oil. (c) Oil of Sweet Birch. (d) Oil Cassia (Synthetic).

5. How many fluid ounces of Carbon Disulphide in 3½ pounds, specific gravity 1.256?

6. How many grains of Morphine in six fluid ounces of Laudanum, U. S. P.?

7. Give the doses of the following: (a) Tinct. Henbane. (b) Pilocarpine Hydrochloride. (c) Tinct. Strophanthus. (d) Homatropine.

8. (a) What is the difference in Scopalamine and Hyoscine? (b) Give the name most commonly employed for Physostigmine.

9. Give the contractions most generally used for the following: (a) Teaspoonful three times a day. (b) Give immediately. (c) Every two hours. (d) Strain.

10. Criticise and tell what you would do with the following prescription:

R Acid. Carbol..... 3 iss.
Aqua q. s..... 3 i.
M. Sig. Use as a mop.

Dispensing.

W. S. Elkin, Jr., Examiner.

Compound the following Prescriptions:

1. R Massa. Hydrarg.....
Ext. Colocyn. Co..... a a 1.00
Pulv. Ipecacua..... 0.12
M. ft. Pil No. 6.

• Sig.—One t. i. d. p. c.

Give amount of each ingredient in Apothecaries Weight.

2. R Oxid. Zinci.....
Bals. Tolu..... a. a. 2.00
Ungt. Petrolat..... Qs. 16.00
M. ft. Ungt.
Sig.—Apply Locally.

Give amount of each ingredient in Apothecaries Weight.

3. R Quininae. Sulph..... Drs. 1
Tr. Capsic..... Drs. 2
Acid Sulph. Aro..... Drs. 1
Glycerin Drs. 4
Aqua. Qs. oz. 4

M. ft. sol.

Sig.—Drs. 1 p. c. et. hs.

Give amount of each ingredient in Metric weights.

4. [Left blank on the printed sheet.—Editor THE DRUGGISTS CIRCULAR.]

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

"Where Do We Stand?"—A Rejoinder.

111 Avenue B, New York, July 9th, 1909.

To the Editor of THE DRUGGISTS CIRCULAR:

To my article printed in your July issue, pages 356 and 357, entitled "Where Do We Stand?" you saw fit to comment editorially. Permit me to make a few remarks in reply. And first of all let me correct an impression of yours regarding myself that seemed to have guided you in much of the subject matter printed in reference to my article. Nothing could be written in a more objective way where the personal element is entirely absent, than my communication. Yet it pleased you somehow to introduce a personal element, conveying the impression that I *must* be an "old apothecary," one of those eternal cranks that are perpetually finding fault, etc.

Beginning with your concealment of my name and signing instead "Old Apothecary" and ending with many references you make to the standpoint of an owner of a store "withering up and dying," it is evident that you mistook me for some foggy, some person who is more of a fossil than a live and striving thing. But nothing is further from the truth than this. I happen to be just a shade the other side of forty and am considered young, also am the owner of a store comparatively young and doing the average business of the neighborhood store.

And now as to your arguments. A very easy way of getting rid of an opponent's arguments is to call him a name. "Ah well, you are a democrat, a liberal," or "Say, you talk like a socialist." In your case you half settled the argument by calling me a "pessimistic philosopher," as if this settles anything one way or another. Again, you "fancy" that what I said about the drug business can be applied with equal force to the medical and law professions and to many lines of business. It is but too true. But does that make it any less true because I said it about the drug business? A truth is the more forcibly true the more it can be tested in different ways and directions. And had my topic been the medical profession I would surely not have failed to point out how the spirit of commercialism has pervaded there too and brought about conditions that are a serious menace not only to themselves but to everybody concerned. But I do most seriously question your belief that what I said "would have been just as true if it had been written about the drug business in any other period of its existence." Archives and books of statistics are not available in my stock in trade, but facts of common knowledge hardly need the verification of figures. The thoughtful will understand me without my going into specifications. Possibly I may throw some more light on the subject when I state that not being either a populist or a Rooseveltian republican, I am fully convinced that the era of trusts has come to stay until it runs its full development.

But before the Trust is replaced by anything else it will just as facetiously swallow up the retail drug business as it did the dry-goods business and many others.

Next you talk about natural law, intimating that "big fish were eating the little fish" before there was any big man to eat little man. Of course, and who denies that? Quite the contrary, the main issue of my article is to show that conditions in our business having steadily developed in the direction of decline; they must finally and inevitably lead into the Trust. And is not this a case of big fish eating small fish? I find that no attempt was made to meet me on this issue, although it actually is the burden of all my talk. Instead I am met with all kinds of trivialities and general platitudes to the effect that this or that individual has achieved a noted success, etc., and did I say or imply that such was not the case? But how does this fact, being the exceptional, alter the general drift and tendencies of things? The rich druggists in this city you can probably count on your fingers while the number of poor ones is legion. And your overlooking of the main issue is of a piece with your pleasantries about there having been people at all times and generations who have imagined things were going to the dogs.

Now then, all this is no news to me or anybody, and I cannot hail it as a discovery in sociology. Naturally, people at all times have complained and will continue to complain even after the millenium is established, and this is as it should be; it makes for progress. But you are entirely mistaken when you interpret my article as a complaint. Indeed, I am not complaining. History records that workmen have at various times attempted to destroy machinery because, forsooth, that machinery was intended to replace them in the factory. In their blind ignorance they could not see that they were fighting to stop the tide of the ocean. I am convinced that the drug business *in general* has been degenerating steadily not only as a profession but as a business as well, and that the Trust is coming to replace the mass of small stores. This I have tried to show, and as far as complaining is concerned I feel I would be in the position of those workmen trying to break up newly invented machinery.

As to your statistics purporting to prove that I was wrong in my assertion that the proportion of increase of population and increase of drug stores is that of 2 to 5, I claimed not accuracy of figures, although I am still right as far as a certain section of this city that I had in mind, is concerned. However, I will call to your mind a small omission in working out your figures, and it is this: almost each and every department store runs a drug department and it is well known such a department does the business of many small retail drug stores. Certain leading drug stores in this city are known to count their daily receipts into the thousands of dollars—could you have figured such as single stores? Or were they also factors twenty-five years ago that druggists grieved about? Of course you had nothing to say to one highly significant statement of mine and that is, that the cost of running business has probably increased 50 per cent., while profits have decreased 25 per cent. Now I will supplement this with the following. Under present conditions of cost and profit, to maintain himself properly and decently, the druggist of the average neighborhood store must

have a daily receipt of not less than \$25, while the store having a general sale of proprietary goods should take in about \$35 or \$40 daily. I ask, Is it not a fact that stores of such type are rather of the exceptional than the average kind? To the best of my knowledge—and in this many men of authority and experience will bear me out—the mass of stores in this city of Greater New York are struggling hard to make both ends meet and then do not always succeed.

Given an earnest desire not to delude oneself and an ability to put two and two together, one cannot help—so it seems to me at least—drawing those conclusions, whether cheerful or otherwise, that I already have indicated in my previous letter.

M. MAHLER.

How Is Business?

Across the Delaware, July 11th, 1909.

To the Editor of THE DRUGGISTS CIRCULAR:

I have been very much interested in the "lubricant" discussion in your journal. I would like to give you my experience in the drug business, and if you care to do so you may publish it, as I would be pleased to hear my brother pharmacists comments on it, also to know if they think that I have done ordinarily well or the reverse.

I am thirty years of age and until three years ago I was a drug clerk at all kinds of salaries up to \$100 per month, which was the most I ever received. Three years ago the first of July I bought this store without one cent of capital. I managed the store for three months for the owner before I bought it, as he was not a druggist and wanted to get out of the business.

I bought the store without taking an inventory, paying \$4,100, which I think was more than it would have invoiced. I gave bond to the owner to pay for the store, the conditions of the obligation being as follows: I was to (1) lift and turn over to the owner of the store certain notes held by a wholesale drug house amounting to \$769.72, with interest. (2) Assume the contract for and agree to pay the balance of \$200 on a soda fountain, with interest. (3) Endorse and pay at the rate of \$100 per month, with interest, a certain note for \$2,000, which was held by a bank and endorsed by the store owner. (4) After the \$2,000 note was paid in full with interest, to pay to the store owner \$100 per month, with interest, until the balance of the principal debt of \$4,100, with interest, was paid in full. This contract was entered into July 1st, 1906.

I went to work to see what I could do, and in one year after I bought, I tore out the old fixtures and put in an up-to-date set of mahogany fixtures at a cost of \$4,000.

To-day my store, stock and fixtures (on which latter I write off 10 per cent. for depreciation each year) invoices \$10,082.60, and I still owe \$900 of the original purchase price.

My cash sales have been as follows:

First year.....	\$12,353.55
Second year (panic year from October on)	16,896.75
Third year (panic year up to March) ..	17,981.45
My rent is \$50 per month; my heat and light, \$22	

per month. I keep three clerks, one I pay \$75 per month; one, \$35, and one \$25 (the two latter having the college privilege on alternate days in winter). I do not take a stipulated salary, but have taken out of the business for my own personal use cash as follows: First year, \$1,314.80; second year, \$1,358.90; third year, \$1,375.90. I carry \$9,000 insurance, which costs me \$125.

My store is in a manufacturing town of 10,000 population and has five drug stores, so you see I have some competition. I buy from traveling men and jobbing houses, and do not belong to any buying clubs.

I really do not know whether I have done well or not, so would be pleased to hear from my brother pharmacists as to what they think. IN DOUBT.

[While a full statement such as a professor of commercial pharmacy might require can not be compiled from the foregoing figures, to an ordinary man who knows whether he has money or not by being able or unable to take it in his hands and count it, these figures amount to something like this:

The "Doubter" has on his hands a stock (including fixtures) worth.....	\$10,082.60
He owes on this.....	900.00
Leaving him a clear interest worth.....	9,182.60
During three years he has drawn from the business.....	4,049.60
Beginning with nothing, in three years the "Doubter" has spent or saved.....	13,232.20
A salary of \$100 a month for three years is	3,600.00

So it seems that the "Doubter" has ac- cumulated over and above his best pre- vious salary, in three years.....	9,632.20
Which is at the yearly rate, in excess of his maximum salary, of.....	3,210.73
Or a net return per year of.....	4,410.73

Why does he doubt?—Editor THE DRUGGISTS CIRCULAR.]

Post-Graduate Courses in Business Methods.

Plattsburg, N. Y.

To the Editor of THE DRUGGISTS CIRCULAR:

I am just reading over again a short article in the June issue of the CIRCULAR, and I am glad to know that the opinions of your constituency is of such importance to you. But my own patrons' views are of importance to me.

I was impressed by an editorial suggestion not long since, which, it seems to me, might bear fruit. The idea was that arrangements should be made whereby several pharmacies especially adapted to the purpose should take graduates in pharmacy, and give them a post-graduate course of instruction and practice, business methods and store management being the end to be striven for.

This seems to be a very reasonable suggestion, and I should very much like to be one of those who might bring the matter to the consideration of organized drug interests. O. T. LARKIN

A Clerk's Advice to Clerks and Proprietors.

Stoneham, Mass., July 12th, 1909.

To the Editor of THE DRUGGISTS CIRCULAR:

I know you are interested in drug clerks and that clerks are interested in every thing that tends to better their condition, for I am a drug clerk myself and am continually looking for means and opportunities to better my condition, and I am very sure that my desires and aspirations are not materially different from those of the great army of clerks throughout the length and breadth of the land, but perhaps from a wider experience than many I may be able to write something of interest not only to clerks but to proprietors as well.

I have spent nearly twenty years of my life in a drug store, during which time I have officiated in every capacity from janitor to proprietor employing three clerks, a man to make ice cream and soda syrups, and a janitor. At the same time I held the position of cashier for a branch office of a trust company doing business through the Boston Clearing House and did considerable notary public work. My health failed and I had to resort to out-of-door-life for a while. After three years' retirement from active business life I had a desire to again enter the drug business and so secured a position as clerk in a progressive up-to-date pharmacy with a Ph. G. as proprietor and am now employed combating disease, making the sick man more comfortable and happy, so far as possible, and I trust pleasing my employer.

Integrity, *vim* and ABILITY are three stepping stones that will land any drug clerk in a position as manager or a proprietorship within a very few years, from five to ten, depending on ability. I was manager of a store even before I was registered and am satisfied there are thousands who possess as much or more ability and whose opportunities are as good or better. Let me say right here that while there are plenty of drug clerks there is a dearth of really good ones in the market because proprietors who get really good clerks are loath to let them go and will offer as good advantages as can be secured elsewhere. Proprietors are willing to pay good salaries if clerks can make good.

To clerks I would say: Study your work.

Learn to do the most in the least time possible.

Whatever you do, do thoroughly and well.

Be neat, careful, exact, and systematic.

Study your store, make it as neat and attractive as possible and rest assured you will not displease your employer.

If you officiate in the capacity of salesman, study your customers; be prompt, attentive, and polite. Remember that a satisfied customer is the best advertisement possible for the store, a sure means of holding patronage and gaining new, a stepping stone to more salary.

Be progressive and well informed on topics pertaining to your profession.

Remember that slang, profanity, and ungentlemanly acts are reprehensible at all times and places, and especially so in a drug store where there are often ladies and gentlemen of refinement to whom such language and acts are obnoxious.

Excel in whatever you do and you will surely win the goal of your ambition.

Now a word to proprietors: Use judgment and discretion in your selection of help. State definitely

their duties and hours, what you expect and require of them, then "try them out," and if they prove competent you can safely dismiss the care of those duties you require of them to their charge, otherwise the best thing to do is to discharge such help and secure those whom you can trust to do their duties without watching, for no proprietor can with justice to himself and his profession be bothered with the detail of all departments of the modern pharmacy.

Do not hesitate to compliment good work or to reprimand carelessness and neglect of duty.

Pay living wages and treat your clerks humanely.

Organize your working force and arrange the hours so as to obtain the best results possible for money expended without over-working yourself or clerks.

Make the conditions of your clerks as pleasant and agreeable as possible.

Be frank and honest with your help, and your help will be frank and honest with you if they are worthy of your hire, otherwise something is wrong. Find the trouble and remove it.

I am "chock full" of "business hints" which I will gladly impart to any one interested enough to address me.

Very truly yours, for better conditions of clerks, proprietors, and the profession in general,

E. J. WHEELER.

Thinks Drug Clerks Should Organize.

Beverly, Mass., July 13th, 1909.

To the Editor of THE DRUGGISTS CIRCULAR:

I have just finished reading an item in the CIRCULAR for July, page 382, entitled "British Assistants Organize," and it leads me to write what follows:

Why do not registered drug clerks *here* (and registered assistants) unite in some such manner for their mutual benefit? It seems to me that there must be something wrong when plasterers are able to get 60 cents per hour (and then wish for more), while plumbers, masons, carpenters, machinists, car conductors, etc., etc., without number, get at least as much as the average registered drug clerk, and usually more. It is a poor plumber or mason who can not average \$20 per week the year 'round, and yet the pharmacist, a professional or partly professional man, works for \$15 to \$18, is pleased to get \$20, jubilant at \$25 or \$28, and would faint at the mention of \$35. It would take more than \$35 to make a good plumber faint.

It is probably true that the drug clerk spends more money and much more study to qualify for his vocation, and besides, he must pass a State board of registration, than the doctor and the lawyer, but yet he gets a much smaller remuneration than any good workman in the ordinary trades. Moreover, he works more hours per week and more holidays per year and with closer confinement than workmen in any other vocation.

I believe that organization would remedy this state of affairs, help do away with "liquor" drug stores and the cut-price evil. The profits lost by cutting prices (intentionally or because of competition) *should* be going to pay a higher wage to deserving drug clerks. It is just as though the public were getting part of the clerk's wages.

I am neither a registered clerk nor a registered assistant (although I hope to be the first, sometime), so

this state of affairs may seem to be: "none of my funeral" anyway, but I would like to see this letter be the means of leading some clerk to start an organization of some sort.

Do not think I am a croaker or a pessimist, for I make it a rule to be satisfied as far as possible with things as they are, and I am writing this communication because I think it might do some good for druggists and their clerks especially.

WELL MEANER.

[There are various drug clerks' organizations throughout the country. Every now and then such an organization springs up, seems to flourish for a while, or as long as the initial enthusiasm keeps up, and then dies of inanition. We believe that some of these organizations are affiliated with labor unions, but as this is so obviously a *mésalliance* the idea does not seem to have favorably impressed a large number of clerks.

Some time ago we ran across a tabulated statement, said to have been prepared by James Phillips, of Chicago, which is of interest in the present connection; we have made no attempt to verify the figures, but present them as found:

Average of Weekly Wages Paid in Thirteen Different Trades in the United States and Europe:

Trade.	U. S.	Great Britain.	France.	Germany.	Belgium.
Blacksmiths ...	\$16.52	\$9.74	\$9.12	\$6.92	
Boilermakers ..	15.95	9.63	8.14	6.29	\$4.21
Bricklayers ...	26.26	9.89	6.36	6.37	4.05
Carpenters	17.79	10.03	7.64	6.44	3.52
Compositors ...	22.33	8.97	6.51	7.05	4.77
Hod Carriers...	13.74	6.00	4.63	4.07	2.07
Iron Moulders..	17.30	10.18	7.46	6.50	3.94
Laborers	9.38	5.70	5.40	4.46	3.07
Machinists	15.15	9.39	7.42	7.33	
Painters	16.90	8.69	6.14	5.85	3.26
Plumbers	21.70	9.93	7.35	5.62	3.84
Stonecutters ...	20.70	9.77	7.09	5.76	3.35
Stonemasons ...	22.89	10.39	7.24	6.64	4.22
Total	\$236.61	\$118.31	\$90.50	\$79.30	\$40.30
Average	\$18.20	\$9.10	\$6.96	\$6.10	\$3.66

In other words, in the United States for every one dollar a man earns in the thirteen trades, he earns 50 cents in Great Britain, 38 cents in France, 34 cents in Germany, 20 cents in Belgium. Taking the four European countries and averaging them, for every one dollar the American workman earns, the European workman earns 36 cents.

Editor THE DRUGGISTS CIRCULAR.]

A Short Catechism.

Up Broadway, July 14th, 1909.

To the Editor of THE DRUGGISTS CIRCULAR:

The question is, Has pharmacy gone to the dogs?

No! It has gone plumb to a place whose name it would not be polite to mention.

Is the writer a pessimist? No! He is an optimist in every drop of the blood in his body. He just wants prosperity to come to this land once more.

Can pharmacy be made to pay? Yes, *perverted* pharmacy can be made to pay.

What is it otherwise known as? Commercialism gone rampant.

What is commercialism? Alert, cold-blooded, eternal, persistent, consistent scheming and watchfulness; an ever winking at the ways that are devious and unscrupulous, grasping every opportunity and failing in none; an ever keeping in mind, Win, no matter how, *but win*.

What is legitimate pharmacy? It is adhering to the most scrupulous lines of honesty and integrity, wavering and deviating not one iota from all that is absolutely accurate, straightforward and noble, ever keeping in mind, "Whatsoever ye would that men should do to you, do ye even so to them."

Can legitimate pharmacy compete with commercialism? It has just as much chance as the old one-horse shay has against the modern flying machine.

Then how can pharmacy win? By adopting this new motto, *Avaunt, legitimate pharmacy; hail the advent of commercialism. "In hoc signo vincimus."*

S. M. F.

[After all, wasn't the old one-horse shay surer and safer than the modern flying machine?—Editor THE DRUGGISTS CIRCULAR.]

Why Confine the Use of Red Cross Stamps to the Christmas Season?

United States Government Hospital for the Insane.

Washington, D. C., July 1st, 1909.

To the Editor of THE DRUGGISTS CIRCULAR:

Will you allow me to say a few words, referring to the excellent work that has been done during the past ten years, by the American Red Cross Associations, at home and abroad, and to the use of the official Red Cross stamp?

Why would it not be advisable to use the official Red Cross stamp every day in the year, and thereby help the work that must be done every day and every night by those patient and ever-faithful trained nurses, and members of the "Old Guard," civil and military members of the medical and hospital corps?

JOSEPH MCKEE.

Still Harping on the "Lubricator."

"I have been a subscriber for about twenty-five years," writes W. E. Cramer, of this city, "and have never found anything in the CIRCULAR to take exception to until the account of that wonderful druggist. All I have to say is, if he can produce any such result in my store he can have \$6,000 a year salary; better hours (so he can see the sun); and put his money out at interest."

Chatterton's Compound.

An insulating covering for telegraph wires, known as Chatterton's compound, or *Willoughby Smith's compound*, was originally the subject of a patent. According to the *Chemist and Druggist* it has the following formula:

Stockholm tar..... 1 part.
Rosin 1 part.
Gutta-percha 3 parts.

Melt together the tar and rosin and add the gutta-percha.

Everybody advocates sobriety. The drinking fellow who does more business and gets better pay than the total abstainer succeeds in spite of his bad habit, not because of it. Maybe the abstainer does not amount to much at best, and if he were a drinking man his handicap might throw him out of a job entirely.

Notices of Books Received.

PRINCIPLES OF PHARMACY. By Henry V. Army, Ph. G., Ph. D.; Octavo; cloth; 1,175 pages; 246 illustrations. \$5, net. Philadelphia and London: W. B. Saunders Company. 1909.

Departing in several instances from the scheme of the existing books on pharmacy, Prof. Army has sought to improve upon their method of explaining pharmaceutical standards, preparations and manipulations. This latest "pharmacy" is divided into seven parts: Part I opens with an introduction to pharmacopœias and pharmacal physics, and deals with pharmaceutical processes. The arithmetic of pharmacy, a phase of the science in which some students—and others—are said to be woefully deficient, receives particular treatment. Part II deals with pharmaceutical preparations, galenic not chemical arranged in type groups. Part III contains an instructive chapter on the theories of chemistry, and treats of inorganic pharmaceutical chemistry and the inorganic chemical preparations. Chemical arithmetic is discussed lucidly at some length. Part IV is devoted to organic pharmaceutical chemistry, and opens with an introduction to the theory of that division of chemical science. In part V pharmaceutical assaying and chemical testing are discussed. The official tests and assay processes are grouped in a systematic arrangement somewhat similar to that suggested for adoption in the Pharmacopœia. This feature adds much to the convenience and usefulness of this volume. Part VI is devoted to the discussion of the prescription, characteristic prescriptions being given in fac-simile and dispensing being treated at length. The final division, part VII, gives the scheme of laboratory work which the author has found conducive to the best results in his instruction of pharmacal students. The exercises in equation writing, stoichiometry and chemical arithmetic are particularly valuable.

Pharmacy has been well favored with authors, and the arrival of a new book is quite likely to be greeted with the biblical quotation anent the endless making of books, but the nature of the addition herein noted is such that doubtless a hearty welcome awaits it. The publishers have given the volume a plain, neat dress well in keeping with the substantial character of its contents.

THE HARMFUL EFFECTS OF ACETANILID, ANTIPYRIN, AND PHENACETIN. By L. F. Kebler, Ph. C., M. D., with the Collaboration of Drs. F. P. Morgan and Philip Rupp. Octavo; paper; 85 pages. Bulletin No. 126, Bureau of Chemistry, U. S. Department of Agriculture. Washington: Government Printing Office. 1909.

Many and varied have been the opinions expressed during the past few years relative to the harmfulness or otherwise of the widely used but not well known coal-tar analgesics. Statistics have confronted statistics, and facts (?) have contradicted facts (?); arrayed against Adams' statements in the "Great American Fraud" were the Ohmann-Dumesnil disparagements of St. Louis origin; and in the celebrated "brane-fude" case the expert witnesses for the two sides agreed as to the safe dose of acetanilide about as nearly as expert witnesses usually do. Statistics are valueless unless they have been collected honestly and intelligently, and their significance properly

deduced. The federal government has collected statistics on the question of the harmfulness or otherwise of the three coal-tar remedies named, and seemingly has presented them without fear or favor, bias or prejudice. The result is decidedly unfavorable to those who for profit advocate the use of the ordinary headache powders. Sixty of the pages of the book are devoted to abstracts of the literature of poisoning by coal-tar analgesics, covering a period of twenty-five years.

The message of this little book should reach every pharmacist in the country.

ESSAYS BIOGRAPHICAL AND CHEMICAL. By Sir William Ramsay, K. C. B. Octavo; cloth, gilt top; VII + 247 pages. \$2.50, net. New York: E. P. Dutton & Co. 1909.

It has been said that the biographies of those who have made history are the best histories; at least they are the most readable. Hence one would expect to find in the biographies of eminent scientists written by one of equal eminence, all that is best in the progress of the sciences; and in this instance there is no disappointment. In the sketches of Boyle, Cavendish, Davy, Graham, Black, Kelvin and Berthelot, Sir William has given to scientific literature rather full and very interesting accounts of the accomplishments of these men and of their contemporaries, and in a manner that makes pleasant reading.

None the less interesting and instructive are his scientific essays on the Becquerel rays, radium, the periodic arrangement, electricity, and the aurora borealis. And the chapters on the early days of chemistry and on how discoveries are made are replete with good things for the student of science.

THE URINE AND CLINICAL CHEMISTRY OF THE GASTRIC CONTENTS, THE COMMON POISONS, AND MILK. By J. W. Holland, M. D. Eighth Edition, revised and enlarged. Duodecimo; cloth; x + 160 pages (printed on one side); illustrated \$1, net. Philadelphia: P. Blakiston's Son & Co. 1908.

Much has been written of late in the way of advice to pharmacists that should arouse an interest in the practicability of clinical chemistry in the pharmacy. Doubtless many have been led to consider this matter. To these an acquaintance with Holland's work on clinical analysis will be useful. This latest edition treats fully many of the more widely used methods of examining qualitatively and quantitatively morbid urine and the gastric contents, of detecting common poisons, and the study of normal milk. The various tests are clearly stated, and the accompanying directions and illustrations are quite comprehensive.

The shape of the volume will be appreciated by workers in drug-store laboratories. To these also will be apparent the utility of the blank pages.

THE "WILL-O-THE-WISP," a Chemical Narrative. By V. von Unruh. Twenty-four mo; paper; 18 pages; 25 cents. New York: The Author. 1909. A readable monologue by "Methane" mostly about some of "her" relations, or descendants, in the hydrocarbon family, told in non-technical language.

Somebody once said to a chronic "groucher": "The world is not against you; it is too busy."

Investigating Radam's Microbe Killer.

United States District Attorney D. W. Baker has filed a libel in the supreme court of the District of Columbia under the federal food and drugs act, praying for the condemnation of twelve cases of Radam's microbe killer recently seized in the office of Dean, Swift & Co., a firm of patent attorneys who have been engaged in selling the preparation in question at retail. No defense having been made within the prescribed time, the decree of the court will issue soon.

The action of the district attorney in this case is based upon complaints made by the bureau of chemistry of the department of agriculture by which the preparation has been analyzed. The government's contentions with respect to the alleged misbranding of the goods seized are set forth in the libel in part as follows:

Your libellant further represents that the said twelve cases, more or less, of said liquor or drugs, and each and every bottle thereof contained in said cases, are illegally held within the jurisdiction of this honorable court, and are liable to condemnation, and confiscable as provided by the said act of congress approved June 30th, 1906, for the reasons following:

In that the said liquor or drug is misbranded within the meaning of the said food and drugs act approved June 30th, 1906, for the reason that each and every bottle thereof is labeled and is being sold by the said firm of Dean, Swift & Co. as a drug, and the packages and labels bear certain statements regarding the said drug which are exaggerated, false and misleading, and that among the exaggerated, false and misleading statements are the following, that is to say: "It" (referring to the said Radam's microbe killer) "is a positive and certain cure for all diseases and is guaranteed to be perfectly harmless. It will effect a cure in every instance if given a fair trial"; and the further statement: "Cures by removing the cause—microbes"; and the further statement: "Microbe Killer is perfectly harmless and can be taken in any quantity without danger"; and the further label, and legend blown in the bottle, as follows: "Cures all diseases"; referring in each and every case to the said Radam's microbe killer; and that there is certain advertising matter accompanying the unit package, said advertising matter containing false and misleading statements, that is to say: "Radam's microbe killer is the only known principle that will destroy the microbes in the blood without injury to the system. While known scarcely twenty years, millions of people already testify to its wondrous curative energy. By removing the one cause it cures disease"; and further in said advertising matter a large number of diseased conditions are enumerated in which Radam's microbe killer is represented as a cure, that is to say anemia, asthma, blood poisoning, cancer, consumption, diabetes, diphtheria, la grippe, malaria, yellow fever, paralysis, pneumonia, whooping-cough, and other diseases.

These statements and all of them are exaggerated, false and misleading in this, that the said drug or liquor is not a cure for all diseases, and does not remove the cause by killing the microbes of the several diseases named or others named in said advertising matter, and are further exaggerated, false and misleading in that the product cannot be used in its present form to kill the microbes of the several diseases herein referred to; and that these statements heretofore enumerated and all of them, regarding said liquor or drug, are exaggerated, false and misleading within the meaning of the said act of congress approved June 30th, 1906.

Your libellant further represents that all the matters above set forth are true; that the said twelve cases, more or less, of said liquor or drug, and each and every bottle contained therein, have been transported from the city of New York, State of New York, to the District of Columbia, having been consigned by The William Radam Microbe Killer Company, a body corporate, of New York city, to Dean Swift, in the said city of Washington, District of Columbia, on, to wit, the twenty-eighth day of May, 1909, and on other days which are not known at this present time to your libellant; and the said cases and bottles contained therein now remain unsold, and the same are now offered for sale and are being sold in the said District of Columbia by the said Dean Swift.

And your libellant further shows that there now remain unsold and in original unbroken packages certain cases, to wit, twelve cases, more or less, of Radam's microbe killer consigned as aforesaid, in the premises aforesaid, and which are now held by the said Dean Swift.

No information is available as to whether the department of agriculture will institute proceedings against the manufacturers of this preparation. No defense having been set up by the parties in whose possession the goods were seized in Washington, no opportunity will be afforded for the trial of the case on its merits.

Mme. Yale's Preparations Misbranded.

On or about June 30th, 1908, an inspector of the department of agriculture found in the store of S. Kann Sons & Co., of Washington, D. C., a quantity of drug preparations which had been shipped to the said S. Kann Sons & Co., from New York, N. Y., on June 26th by Maude Yale Bishop Wilson. The consignment comprised seven distinct preparations: Fifteen dozen packages of "Madame Yale's skin food," eight dozen packages of "Madame Yale's fruitura, woman's tonic," two dozen large-size and six dozen small-size "Mme. Yale's fertilizer tablets," twenty-four dozen

small-size and twelve large-size packages of "Mme. Yale's excelsior hair tonic, the great hair grower," three dozen packages of "Mme. Yale's excelsior complexion bleach," twelve dozen small-size and two dozen large-size packages of "Mme. Yale's antiseptic," and one dozen packages of "Mme. Yale's blush of youth," on the labels of all of which were statements which in the opinion of the United States district attorney constituted misbranding under the federal food and drugs act (see the CIRCULAR for August, 1908, page 370); and he began libel proceedings for the seizure and condemnation of the preparations.

Samples of the several preparations were obtained by the department of agriculture and subjected to analyses in the bureau of chemistry. The analysis of the preparation labeled "Mme. Yale's excelsior skin food" disclosed that "it consisted of 76.5 per cent. of vaseline, which was mixed with fixed oil or fat and zinc oxide, colored with a pink dye, and perfumed." The analysis of the preparation labeled "Mme. Yale's excelsior fruitura" disclosed that "it consisted of 76.97 per cent. of volatile matter (largely water, with 16.66 per cent. of alcohol by volume), 29.71 per cent. of sugar, and small quantities of plant drugs." The analysis of the preparation labeled "Mme. Yale's fertilizer tablets" disclosed that the tablets "were very largely composed of charcoal, compounded with potassium bitartrate and sugar." The analysis of the preparation labeled "Mme. Yale's excelsior hair tonic" disclosed that "it consisted of 15.56 per cent. of alcohol by weight, 82 per cent. of water, and small amounts of glycerin, perfumed with bergamot oil." The analysis of the preparation labeled "Mme. Yale's excelsior complexion bleach" disclosed that "it was mainly a saturated solution of borax in orange flower water." The analysis of the preparation labeled "Mme. Yale's antiseptic" disclosed that "it consisted of 97.6 per cent. of volatile matter (16.96 per cent. of alcohol by weight, 4 per cent. of formaldehyde, and water), 2.37 per cent. of boric acid, and aromatics." The analysis of the preparation labeled "Mme. Yale's blush of youth" disclosed that "it consisted of 56.15 per cent. of volatile matter (6.30 per cent. of alcohol by weight and 49.85 per cent. of water colored with a coal tar dye and perfumed), and about 43.85 per cent. of glycerin."

The statements on the labels were so at variance with the results of the analyses, that at the final hearing, June 9th, 1909, Justice Anderson in the supreme court of the District of Columbia declared the articles to be misbranded, and ordered the claimant (Mme. Yale) to pay the costs of the proceedings, permitting her to retain the libeled preparations if she filed a bond for \$500, conditioning that the preparations would not be disposed of contrary to the food and drugs act.

To Draft a Model Food Law.

E. F. Ladd, of Fargo, N. D., has issued the following call for a conference of all interested parties with the committee named therein, of which he is chairman:

There will be a meeting August 23d, of the committee appointed by the Association of State and National Food and Dairy Departments, to draft a model food bill. This meeting will be held at Denver, Col., in connection with the meeting of the association, and manufacturers interested will be given an opportunity to appear before the committee and make any statement or suggestion with regard to the provisions of the proposed model food bill.

We ask that all statements and arguments be submitted in typewritten form and, if possible, that the same be submitted to a member of the committee before the meeting at Denver, in order that the committee may have an opportunity to consider the suggestions. The time will be limited to five minutes for each speaker who appears before the committee.

Denver's Anti-Narcotic Ordinance.

The city council of Denver, Col., recently passed an ordinance designed to restrict the sale of narcotic and poisonous drugs, the principal clause reading as follows:

It shall be unlawful for any apothecary, druggist, or pharmacist, or any employee thereof, or any other person whatsoever, to sell, barter, exchange, give away, dispose of, or deliver to any persons within the city any morphine, strychnine, laudanum, opium, cocaine or carbolic acid, or any extract or product thereof, except upon the written prescription or order of a duly licensed physician, as provided in this chapter, and except upon the day or date of such prescription or order, and there shall be, for each such sale, barter, exchange, gift, disposition or delivery, a special and distinct order or prescription in each and every instance.

A penalty of from \$10 to \$100 attaches to the violation of the ordinance.

DRUG STORE ADVERTISING

By M. P. Gould, of New York

In this department some of the fundamentals of successful drug store advertising will be expounded each month. The aim is to correct errors of advertising and establish the most profitable and advisable methods of building up retail drug trade by means of the powerful influence of advertising.

"Reiteration."

The editor of THE DRUGGISTS CIRCULAR sent me a short time ago, a very much appreciated bouquet in the form of a letter saying that it was a constant surprise to him that a person could write as many articles on one subject as I have written during the last eleven years for the CIRCULAR, and still make each article so varied and interesting.

Thinking that possibly readers of THE DRUGGISTS CIRCULAR may be interested in knowing how it is done, I am going to tell just how I write this present article. By following the story through, it will seem that all of my writings are developed from experience taken from every day events.

For example, this morning I received by mail a little house organ in the shape of a very small vest-pocket booklet. As I was glancing through it I noticed a paragraph about "Reiteration." The statement was made that "Reiteration is an enormously important factor in advertising. Any business that has not reached a stage of development by which it has a well settled policy that benefits both the house and the customers, cannot stand publicity. This policy once settled, should be maintained. Hence reiteration necessarily becomes fundamental."

My experience has taught me that reiteration is one of the most valuable things in advertising. The advertiser who issues one great big advertisement, and then doesn't advertise again for quite a while, is not nearly so apt to succeed as is the man who puts out a small advertisement repeatedly with new copy. He is the man most liable to get the largest returns for his advertising.

Consequently when I read in this house organ that "Reiteration is fundamental and enormously important," I have more respect for the

firm which has made that statement.

I put the little book down and began to think about it, and I very shortly came to the conclusion that that would be a good topic for an article in THE DRUGGISTS CIRCULAR.

I then took down from my desk Chapman's, The Law of Advertising and Sales, Vol. II. In running through the index I noticed one chapter headed, "The Price of Success." Something told me that repetition had a great deal to do with the "Price of Success," and inasmuch as Mr. Chapman had a good reputation, he probably would have something to say in this chapter about repetition. The chapter begins like this:

"Josh Billings said: 'Reputashun iz a good deal like a bon-fire. You hev got tew keep pilein' on the shavings; if yew don't the flame will soon sub-dew.'"

Commenting upon this assertion, Mr. Chapman says:

"And it is no more foolish for a farmer to plant seed in the morning, and dig it up at night, before it has a chance to grow, than for an advertiser to abandon a plan of campaign with all its incidents of distribution, copy, mediums, etc., if it does not develop satisfactory returns at once."

Later in this chapter, I find this kind of talk, credited to an advertiser: "If I want to get well acquainted with a man to whom I have been introduced, I speak to him every time I meet him. If I spoke to him but once and then passed him by without recognition the next time I saw him, and continued to pass him without speaking, or, perhaps, spoke to him two or three times a year, we couldn't get to know each other very well. That's the way I look at the advertising business. When I want the buyers of a certain territory to

get so familiar with me that they will think of me whenever they are in need of goods in my line, I want to speak to them in every issue of their favorite publication."

Near the close of this chapter, we find the following expressions:

"But let no prospective advertiser be lulled by the anticipation that the

Beauty and Health

There's beauty and health through perfect skin protection and care, in the use of our Complexion Lotions and Powders. Summer sun-tan, blemish and freckles are prevented; the skin is given a youthful blush and the pores kept healthy. Let us suggest the proper toilet helps for now—to use at home or abroad, at seashore or in the mountains.

(Name and Address)

public will immediately respond to his claims for recognition, because that is not the natural law of growth.

"At Santa Barbara nature gives us grapes as luscious as one would wish to taste, but the vines that bear them have been growing for 400 years. So, profits in advertising that are now being enjoyed by well-known advertisers, have developed slowly. Working and waiting, seeing one fortune slip away to win another—this is the price of success in advertising and sales that develops good-will."

Right here my feeling began to indicate that reiteration might be a very good thing but that there could easily be a screw loose somewhere if reiteration were the prime consideration.

In turning over just what ought to be coupled with reiteration, I came across an article in the magazine called *Advertising and Selling*. This is the remark:

"A talking point which might be of great value in one proposition may be valueless—an absolute damage even—in another. So much depends upon the different factors which go to make up a proposition, that it is impossible to determine always whether a talking point evolved by means of much study and discussion will 'pull.' Indeed there is a great deal of similarity between a talking point

and a play; no one can tell whether the result of presentation will be fame or failure."

That gave me my idea. An advertiser might reiterate the wrong thing so often and so continuously, that he would ruin his business. While I was thinking over this problem, a druggist in the office remarked that my article

the experienced national advertiser, "I want my advertisement to be in every one of those publications, so that every member of the family will read my ad, and no matter what publication is picked up, my ad will be seen until no one of the family can by any chance, get away from it. Consequently, if the mother doesn't happen to

to produce. Every size, shape and flavor—correctly and cleanly made from choice-grown tobaccos. Particular and fastidious smokers find here a satisfaction not to be overlooked.

in the July CIRCULAR hit the nail right on the head. I asked him what particular part of it he was thinking of, and he said that part where I explained that each store ought to find the right thing to advertise—that which would bring trade to one store, might not bring it to another. To use his words, "That is the real crux of the whole advertising business."

These two things, then are the basis of my article this month. After it has been determined what is the best thing to say about the store—the best department to advertise, the best line of talk to use, the best points to emphasize—then the next thing to do is to keep reiterating those points in the most interesting manner, until the whole community knows the store by those points.

There is a great question, especially among beginners, as to duplication in the use of advertising mediums. A few years ago some advertising men gained quite a little notoriety by attempting to pick out a list of magazines which would least duplicate each other, and then to make a specialty of pushing those magazines, claiming that a national advertiser could cover the whole country by using that non-duplicating list.

The theory promulgated by these men had no more permanent value than to encourage advertisers to think the problem out. The result is that now most good advertisers know that duplication is a very valuable thing—in fact it is simply another way of reiterating. An advertiser will say: "If the man in the house takes *Success Magazine*, and the woman takes the *Ladies' Home Journal*, and the boy takes the *Youth's Companion*, and *Everybody's Magazine* is picked up by the different members of the family; if *Life* is read by the college girl, and the *Theatre Magazine* comes to the house to keep the members posted as to the good plays, and the *Christian Herald* is taken because the family is religious to a degree, and if one member of the family is interested in automobiles and therefore reads *Motor*, and another member is interested in sailing, and therefore reads the *Rudder*—then," says

be interested in my ad in the *Ladies' Home Journal*, she will be in the *Theatre* or the *Christian Herald*. So with the other members." That is duplication. The idea is dying that an advertiser can reach and convince a whole family by using just one magazine. Some advertisers are so inexperienced and silly as to think that they can convince people by using just one big advertisement in one magazine. That kind of advertisers don't last very long. They soon cease advertising.

Reiteration is duplication.

If the lady at her breakfast table can read an advertisement in the morning paper regarding a particular store; if then, when the postman comes, he brings a good letter or card or announcement, from the proprietor to her, and she reads that; if as she starts out the door she finds in the front hall a circular from the store; if when she gets on the street car, she sees one of the store's cards; if as she is riding toward the shopping district she sees a billboard with an advertisement of the store on it; and if, as she comes near the store, she sees a good sign identifying it—then that is the kind of duplication which brings a large return from advertising, provided the advertising covers the right "selling points."

I have known a number of advertisers to adopt an advertising slogan—some catch phrase,—starting out with a great gusto, to use that slogan. After two or three months, not seeing many returns from it, they have gotten tired of it and dropped it.

Right here comes in a point that must be remembered. There is the story of the two little boys who had a dispute. Johnny made a certain statement. Sammy denied it. Johnny said he knew it was so. Sammy said he knew it was not so. So Johnny said: "Well, my mother said it is so, and if she says it is so, it is so, whether it is so or not."

Now that kind of doctrine doesn't go in advertising. Simply saying a thing is so doesn't make it so in the public mind. There is so much advertising which is not wholly

QUICK DELIVERY

A feature of our business is the quick, safe and satisfactory delivery service. You can order by mail or phone your orders with the knowledge that we select your goods with the same care as would attend a personal visit, and deliver to you "rush" at no extra cost.

Bring, Send or Telephone All Your Orders

No matter what you want from any drug store, we have it. Insist on trading here and enjoy the free privileges of delivery and the economy of highest-grade goods at fairest cost. Something you want now—drugs, toilet goods, rubber goods, sickroom, bathroom or nursery needs?

in accordance with what the reader thinks are the exact facts, that most advertising is taken "with a grain of salt." The advertiser may be the most honest man in the world. It might make him sick to make a false statement in his advertising, but if he put out an advertisement that was absolutely true, there would probably be not over ten per cent. of the readers of the advertisement who would really accept it as absolutely true. However, those few who came to the store and found out that the advertisement was absolutely true, would then gain the impression that the proprietor was a truthful advertiser. After three or four or more such experiences, they would then believe in his advertising until they experienced, or heard of something to shake their belief. Constantly repeating an honest advertisement adds to the number who believe in it. After several years of such advertising, the advertiser has a large clientele who will believe what he says as long as he continues the policy of straightforward, honest advertising.

However, it must not be forgotten that a man might be honest in purpose and honest in his statements and continually reiterate certain statements about his business and that reiteration might not increase his business. A very reputable book entitled "Modern Advertising," has this to say:

"No advertising is successful which does not sell the goods, and no advertising is unsuccessful which does. Each advertising plan proves what its merits are as it goes along, but the most that the wisest advertising man can do is to make a plan which covers all the incidents of his experience, and then watch the plan. There never was a right advertising plan that was not altered and changed each month. Every inquiry (and we would add each customer who calls in response to an advertisement) should be scrutinized—or questioned—for suggestions as to future wordings of advertisements and reading matter. The entire inspiration comes from people who respond to advertising or who fail to respond. The way in which they respond, or fail to respond, is a measure of the success or failure of your advertising. Nothing will show you the weak spots in a plan so quickly as the absence of replies."

Continuing, this book says:

"Advertising is a great, though almost unknown force, a force made up of a hundred different elements, each one too intangible to be defined. It is something which, properly directed, becomes a powerful agency in influencing human customs and manners. All the great forces that have moved the race, the elegance of the orator, the fervor of the religious enthusiast, superstition, terror, panic, hypnotism—all these things—are utilized in advertising. All the emotions of the race are played upon, appealed to, coaxed, cultivated and utilized. The man who can tell most nearly what one thousand people will think upon any given topic, will come the nearest to producing successful advertising, but no human being can really foretell the actual results of any advertising that was ever planned."

Some men are natural born advertisers, just as some men are natural born orators. They seem to know in advance, or are quick to divine and follow a lead as to what the public will like in a speech or in an advertisement. It is a mistake to treat every advertisement as if the whole success of a business depended upon it. Some part of every advertising campaign ought to be used in experimenting. I have seen advertisers get very angry because they had tried some form of advertising and it did not pay them as well as they thought it ought to. If they did not go into it too heavily, advertisers ought to consider every experiment as a lesson, in teaching them what not to do, as well as what to do.

Certain it is, that, in the way that most newspaper advertising is done by most druggists, that is a form of reiteration which is costly and too often unprofitable. I am a great believer in newspaper advertising. Both from observation of what others have done and from my own experience, I know that newspapers are one of the most profitable advertising mediums in existence. And yet there are a great many hundreds of thousands of dollars being wasted by retail druggists in newspaper advertising. That is not the fault of the newspaper, it is the fault of the druggist. Newspapers will mould public opinion. That general proposition cannot be gainsaid. If a druggist's present style of newspaper advertising is not moulding public opinion in his favor, it is his fault. If he will keep working at it long enough he will in all

probability find a form of newspaper advertising that will bring the utmost results, provided he is not afraid to experiment. There is such a thing as experimenting so long and so continuously, as to delay progress. The advertiser's expectations may be so great that when he really has struck the right "selling points" for his business, he will not recognize that the results are good, but will keep on experimenting, and thus throw away the oyster which contains the real pearl. If common horse-sense tells a druggist that he is superior to his competitors in certain lines, then he should settle down with the bulldog determination to make the public believe it also. He should go ahead and reiterate this fact until the public is brought to his way of thinking.

A very well known advertising writer recently made the statement that "Six good pieces of copy, rotated, or at most ten pieces, are all that any proposition needs for maximum results in a year's advertising." This writer was speaking of fifty-two pieces of copy, for in the above he refers to a weekly publication. He says that "The writer has tested this out, over a period of four years, on more than thirty-five campaigns, and has proven that repetition of copy at reasonable intervals, does not appreciably reduce the pulling power of the advertising, and in some instances has been known to increase it cumulatively."

Along this line some very odd things come to one's attention. Six or seven years ago a druggist in some western State—Iowa, I think—wrote to me and said that every time he inserted in the local newspaper an advertisement on seeds and bulbs, he could see immediate returns from his advertising, but he could not see any returns from his advertising of drugs and other similar lines in his store. He said that he had repeated the same seed and bulb advertisement a half-a-dozen times, and it always brought good returns. This is merely recited in order to bear out the statement made above.

Every druggist ought to be his own judge as to what advertising pays best, and what ought not to be repeated.

However, as a general proposition, worthy of the consideration of every man who spends one cent in advertising, I lay down the rule that reiteration is one of the most valuable elements in successful advertising. The reiteration may be accomplished by a duplication of mediums, or by a repetition of the same copy, or by a variation of the copy upon the same subject, or by a continual pounding of the same idea, varying it in any way that will attract and hold the attention of the reading public.

South Dakota Restricts Medicine Advertising.

The *Mail Order Journal* recently printed the following text of an act passed at the recent session of the South Dakota Legislature, and approved by the governor March 16th:

1. Any person who shall advertise, in his own name or the name of another person, firm or pretended firm, association, corporation, or pretended corporation, or in any newspaper, pamphlet, circular or other written or printed paper, or the owner, publisher or manager of any newspaper or periodical who shall permit to be inserted or published in any newspaper or periodical owned or controlled by him an advertisement of the treatment or curing venereal diseases, the restoration of "lost manhood" or "lost vitality," or shall advertise in any manner that he is a specialist in diseases of the sexual organs or diseases caused by sexual weakness, self-abuse or in any disease of like causes, or who shall advertise in any manner any medicine, drug compound, appliance or any means whatever whereby it is claimed that sexual diseases of men and women may be cured or relieved, or miscarriage or abortion produced, or who shall advertise any medicine or means whereby the monthly periods of women can be regulated, or the menses re-established if suppressed, shall be guilty of a misdemeanor and upon conviction shall be punished by a fine not less than fifty dollars nor more than five hundred dollars or by imprisonment in the county jail for not more than six months.

2. Distributing unlawful. Any person publishing, distributing or causing to be distributed or circulated, any of the advertising matter hereinbefore prohibited shall be guilty of a misdemeanor and punished as prescribed in section one of this act.

Dr. Reid Hunt, chief of the division of pharmacology of the hygienic laboratory at Washington, has been detailed to attend the twelfth International Congress on Alcoholism, held at London, Eng., July 18th to 24th, and the sixteenth International Medical Congress to be held at Buda-Pest, Hungary, August 29th to September 4th.

The net profits of Boots, Limited, the British drug-stores corporation, for the year ending March 31st, last, are reported to have been £23,236 5s. 8d. (more than \$100,000).

Direct-Contract Plan Declared Illegal.

Price-protection through contract schemes received an other blow when Justice Lanning of the United States circuit court for the district of New Jersey, sitting at Newark, June 26th sustained the demurrer to and dismissed with costs, the bill of complaint of the Dr. Miles Medical Company, of Elkhart, Ind., against C. W. Menk, a druggist of Newark. The complainant company sought to restrain the defendant, who had refused to sign its contract to maintain full prices on its preparations, from procuring from other sources a supply of these preparations and from offering them for sale at prices below those established by the proprietor.

In the complainant's bill were recited at length the advantages accruing to it under its system of marketing its products, this system, the direct-contract-serial-numbering plan, being set forth in detail. It was alleged that the defendant procured the products of the complaining company by false and fraudulent representations, and in cutting the prices of the preparations injured the complainant through occasioning a loss of reputation to its products.

Demurrer was interposed to the complaint on the grounds that the complainant did not state such a case as entitled it to any equitable relief; that the contract system of complainant as set forth in the bill was obnoxious to the statute of congress against restraints and monopolies in respect to interstate trade; that the contract system was illegal at common law; and that the complainant, if entitled to any relief, had an adequate remedy at law. Justice Lanning found the second ground of demurrer sufficient to sustain it and to dismiss the bill of complaint. His decision on this issue is in accordance with that in the case of the same complainant against John D. Park & Sons Company, of Cincinnati, for the same relief.

The memorandum of Justice Lanning follows:

The complainant is a manufacturer of certain proprietary medicines and seeks an injunction to restrain the defendant from procuring, or attempting to procure, for trade purposes, from any of its wholesale or retail dealers, any of its medicines. The right to the injunction is based on the contention that the defendant, who has entered into no contract with the complainant for the distribution or sale of its medicines, fraudulently procures them from wholesalers and retailers who have entered into such contracts. The case presented is in all essential respects the same as that disclosed in *Dr. Miles Medicine Company vs. John D. Park & Sons Company*, 164 Fed. 803. There the circuit court of appeals for the sixth circuit declared the contracts by which the complainant sought to maintain its monopoly to be illegal, both at common law and under the Sherman anti-trust act. The contracts relied on in the present suit need not be set out here, as they are exactly the same as those copies in the extenso at the end of Judge Lurton's opinion in the case above referred to. That opinion adopts the judgment expressed in the more exhaustive review of the authorities by the same learned Judge in *John D. Park & Sons Company vs. Hartman*, 153 Fed. 24.

In the present case the complainant alleges that contracts of the kinds set out in the bill have been entered into between it and over 400 jobbers and wholesalers and 25,000 retail dealers in proprietary remedies in the United States. That the effect of such a system is to restrain trade in the complainant's remedies is clear. And when we distinguish between the ownership of a secret medical formula and the ownership of a medicine compounded in accordance with that formula, as I think we should do, and as Judge Lurton did, there is no difficulty, even though the contracts be deemed illegal, in giving full effect to the rule that the owner of such a formula shall be protected against its use when the knowledge of it has been fraudulently or confidentially obtained. I do not think that transactions by which such a product is put upon the market by the owner of the formula are excepted from the regulative provisions of the Sherman anti-trust act. It is true that there are expressions in the opinion of Judge Archbald, speaking for the circuit court of appeals for this circuit, in *Jayne vs. Loder*, 149 Fed. 21, which, read without reference to the facts disclosed by that case, seems to afford ground for the contention here made by the complainant. But *Jayne vs. Loder* was an action at law against a combination of wholesale and retail druggists to recover damages under the seventh section of the anti-trust act. What was there said as to the rights of the manufacturer of a particular proprietary medicine to sell the product of his manufacture on his own terms and conditions was not essential to the decision of that case. I do not mean to intimate, however, that I disagree with what Judge Archbald said on that point. His language is: "Undoubtedly the originator and compounder of a proprietary medicine may shape his own policy, and sell or withhold from selling, as he pleases, according to supposed self-interest or whim, fixing prices and naming the terms and conditions at and upon which alone he will do so, refusing to those who will not comply. And so far as this is confined to his own goods, and pursued by independent and individual action, it cannot be challenged."

If this language be understood to apply only to sales made by the originator or compounder it seems unobjectionable. But if he sells his medicine to wholesalers and retailers throughout the United States upon agreements with them binding them all to sell to their vendees only upon terms and

conditions imposed by him, thereby attempting to control sales of his product in the different States after he has parted with all proprietary interest therein, his contracts with the wholesalers and retailers, in so far as such attempt is made, may be unenforceable, because of illegality under the provisions of the anti-trust act.

It seems to me that we have such a case here. The complainant's contract with retail dealers (see a copy of it in 164 Fed., pp. 803, 809), is one by which those dealers obtain, by purchase, an unqualified title to medicines manufactured by the complainant. The attempt in that contract to restrict the liberty of all retail dealers in the United States in the prices and conditions upon which they may sell, and the parties to whom they may sell, products in which the complainant has no proprietary interest whatever, is one that is obnoxious to the principles of the anti-trust act. I am disposed, also, to construe the contract between the complainant and the wholesale dealers (see a copy of it in 164 Fed., pp. 807, 808) as a contract of conditional sale and not one of bailment. The two contracts should be construed together. Of the wholesale contracts 400, and of the retail contracts 25,000 are now in existence in the several States of the Union. Together they constitute the "system" which the complainant now has in operation. They directly affect sales and restrain interstate trade. Whether they are objectionable under the common law, it is not necessary for me to consider. Judge Lurton seems to think that they are. It may not be easy to harmonize his views with those expressed in the late case of *National Phonograph Company, Limited, vs. Edison-Bell Consolidated Phonograph Company, Limited*, L. R. Chan. Div., Vol. 1 of 1908, page 335. I prefer to place my decision on the ground that the contracts now before me are illegal under the provisions of the Sherman anti-trust act.

As this is one of the grounds of demurrer of the bill, the demurrer will be sustained and the bill dismissed, with costs.

It was stated that an appeal will be taken.

Differentiating between a Medicine and a Beverage.

In reply to numerous inquiries as to what constitutes a bona-fide medicinal preparation containing alcohol, the internal revenue bureau has made the following public statement:

This office holds that in a genuine medicine the alcohol should not be more than is necessary for the legitimate purposes of extraction, solution or preservation, and that the preparation should contain approximately a U. S. P. dose of some medicinal ingredient of recognized value, either alone or in combination with other compatible drugs. Where a substantial effort has been made to introduce medication, without, however, coming up to the standard set by this office, it is the practice to notify the manufacturers and give them an opportunity to change their formulas; and in such cases while the manufacturer is required to pay special tax on account of the manufacture and sale by himself of such preparations, special tax is not required of retail druggists on account of the sale of the same in good faith for medicinal use only, if the formula is changed, or until after public notice has been given, if the manufacturer declines to make such change.

Imported Drugs and Chemicals in Japan.

Some questions arose recently especially among British manufacturers as to the reasons for the rejection of imported drugs and chemicals by the Japanese hygienic laboratory. In this connection the Japanese authorities explained that they never rejected articles conforming to the requirements of the Japanese Pharmacopœia No. 3. They directed the attention of manufacturers to the probable effect of packing and transportation upon drugs and chemicals.

One of the causes for the rejecting of certain articles was the use of metallic containers for extract of ergot, and tannin-bearing extracts in general, whereby the contents became contaminated. Solution of formaldehyde has also been rejected because it did not satisfy the ammonia test of the J. P., which is different from that of the pharmacopœias of most European countries.

Modification of Alcohol-Stamp Ruling.

In several recent decisions the internal revenue bureau has modified T. D. 1476, which required all 5-gallon containers of alcohol to bear a revenue stamp, although they contained less than five gallons of alcohol, by exempting from its provisions glass and earthenware containers, wicker-covered or otherwise, and metal containers, having a holding capacity of five gallons, when the quantity of alcohol contained is less than five gallons.

Massachusetts College Election.

At the recent annual meeting of the trustees of the Massachusetts College of Pharmacy, the following officers were elected: President, C. H. Packard; vice-presidents, L. H. Smith, and Herman Heinivitz; secretary, L. W. Griffin; treasurer, J. G. Godding; and auditor, Max Cramer.

Program for the Los Angeles Meeting of the A. Ph. A.

Secretary J. W. England, of the council of the American Pharmaceutical Association, has announced that that body has approved the following program for the fifty-seventh annual meeting to be held at Los Angeles, August 16th to 20th:

- Monday, August 16th—
 9 A. M. Meeting of the council.
 Meeting of National Association of Boards of Pharmacy.
 3 P. M. First general session.
 8 to 9 P. M. Reception.
- Tuesday, August 17th—
 10 A. M. Second general session.
 3 P. M. First session of the section on commercial interests.
 8 P. M. Meeting of Conference of Pharmaceutical Faculties.
 Meeting of National Association of Boards of Pharmacy.
 Second session of the section on commercial interests.
- Wednesday, August 18th—
 10 A. M. First session of the section on education and legislation.
 3 P. M. Second session of the section on education and legislation.
 8 P. M. Third session of the section on education and legislation, with the Conference of Pharmaceutical Faculties and the National Association of Boards of Pharmacy. (In accordance with the wishes of the local committee on arrangements this joint session will be held at the hotel at Long Beach, where dinner is to be served. Members will be taken by trolley cars to the beach after adjournment of the afternoon session, the trip requiring 45 or 50 minutes).
- Thursday, August 19th—
 10 A. M. First session of the section on scientific papers.
 3 P. M. First session of the section on practical pharmacy and dispensing.
 8 P. M. Second session of the section on scientific papers.
 Second session of the section on practical pharmacy and dispensing.
- Friday, August 20th—
 10 A. M. Session of the section on historical pharmacy.
 2.30 P. M. Final general session.
- The Entertainments.
- Monday—
 Reception in the evening, given by the chamber of commerce.
- Tuesday—
 Forenoon, Auto rides for the ladies.
 Afternoon, Inspection of the fruit preserving plant of Bishop & Co.
 Evening, Card party for ladies.
- Wednesday—
 Morning, Shopping expeditions for the ladies.
 Evening at Long Beach.
- Thursday—
 Afternoon, Trolley trip to Pasadena.
 Evening, Smoker after the meeting. Card party for ladies.
- Friday—
 The balloon trip—a trolley ride to the different beaches and returning to spend the evening at Venice.
- Saturday—
 A trip to Catalina, at 9 o'clock in the morning, via the Pacific Electric Trolley line to San Pedro and thence via steamer to Catalina.

The Plain, Hard-working Druggist at the A. Ph. A.

As was to have been expected, Harry B. Mason, chairman of the American Pharmaceutical Association's committee on commercial interests, has prepared an interesting program for the two sessions of his section. The topics he has selected for discussion and the men he has chosen to lead the discussions show that in one section at least, at the Los Angeles meeting, the every-day druggist will be more at home than the "scientific fellers."

A list of the papers and subjects for talks follows:

Tuesday, August 17th.

1. Address by the chairman, Harry B. Mason.
2. Reports of committees.
3. The Druggist's Mailing List: A symposium by Lewis Flemer, H. F. Ruhl, Franklin M. Apple, W. M. Federmann, Louis Schulze, Jacob Diner and Cornelius Osseward.
4. My Best Selling Soda Syrup: A symposium by F. W. R. Perry, Katz & Besthoff, Ltd., E. E. Calkins, Arthur L. Cheney, George A. Gorgas, William G. Greenawalt and James M. Avis.
5. The Preparation and Use of Show Cards: A paper and exhibition by A. R. Eberle, Watertown, Wis.
6. Winning the Farmers' Trade, by A. V. Pease, Fairbury, Neb.
7. The Druggist and His Advertising, by J. W. T. Knox, Detroit, Mich.
8. Some Thoughts on a Live Subject, by E. N. Ladish, Chicago, Ill.
9. The Handling and Sale of Perfumes, by P. Henry Utech, Meadville, Pa.
10. Credits and Collections, by William Mittelbach, Booneville, Mo.

11. Selling Spices and Flavors, by John F. Patton, York, Pa.
12. Practical Methods of Gaining the Support and Patronage of Physicians, by D. F. Jones, Watertown, S. D.
13. Selling the Dispensing Doctors, by Waldo M. Bowman, Toledo, Ohio.
14. How Best to Increase One's Prescription Business: Two papers, by Jacob Diner, of New York, and Cornelius Osseward, of Seattle.
15. Subjects for extemporaneous discussion: The Inventory; Newspaper Advertising; Bookkeeping Methods; The Soda Fountain; The Handling of Clerks; and One's Own Specialties.

The Purpose of the N. A. B. P.

In a communication sent out to the State boards of pharmacy by F. B. Lillie, of Guthrie, Okla., president of the National Association of Boards of Pharmacy, with the purpose of interesting the members of the boards in the work of the association, some of the things which the organization seeks to accomplish were stated thus:

Reciprocal registration of those qualified to practice pharmacy has come to stay and the time is not far distant when the pharmacists of your State will demand that they be given the right that is given to their brethren in the profession in other States. Your influence as a progressive State board is needed by the association to help in raising the standard of qualifications of candidates and the standard of board examinations to a point where a general interchange of certificates between all the States can be made upon a standard set by the association or by the individual boards.

At the last meeting, the association recommended that all boards affiliating with our association should adopt a minimum average grade of 75 per cent., with a minimum grade of not less than 60 per cent. on any one subject as a passing grade, and that all applicants should have received a grammar-school education or its equivalent. Now if the several State boards agree upon the methods of examinations and the quantity and quality of questions and practical work, we will be accomplishing what this association was organized for, as declared in the preamble to our constitution. This can only be done by organization and co-operation.

If your board believes (it is the case with some) that under your law you cannot register an applicant upon his examination by another State board you can still be associated members and be entitled to all the privileges of the association which you will find provided for in article 3 of the constitution. But you should endeavor to secure such amendments to your law as will permit reciprocal registration, if you expect to be in line with other progressive States, for, as above stated, reciprocal registration between the States has come to stay.

The N. A. B. P. will meet at Los Angeles during the meeting of the American Pharmaceutical Association.

The N. A. R. D. at Louisville.

Simon N. Jones says that this year's meeting of the National Association of Retail Druggists to be held at Louisville, beginning September 6th, will surpass any of its predecessors in the number of persons attending, and in general satisfaction.

The publicity committee of the local association announces that there will be many new features introduced which will detract from the usual monotony of conventions. At the close of the convention there will be an opportunity of seeing the famous Mammoth Cave, which is a comparatively short distance from the convention city. There will be special railroad rates.

Headquarters will be at the Seelbach Hotel; and in addition there are excellent accommodations in many other hostleries nearby.

Pharmaceutical Society of Great Britain.

Thirty-six pharmacists were enrolled as members of the Pharmaceutical Society of Great Britain at the meeting of the council of the society held June 9th, at London. Seven new student-associates were also admitted.

The general fund showed a balance on hand of £3,751 15s. 5d.

Officers were selected as follows: President, J. F. Harrington; vice-president, W. L. Currie; treasurer, Walter Hills; secretary, Richard Bremridge; editor of *Pharmaceutical Journal*, John Humphrey; curator of the museums, E. M. Holmes; and secretary for Scotland, Ruth-erford Hill.

Society of Chemical Industry.

At the annual meeting of the Society of Chemical Industry, held at London, in May, Prof. Ira Remsen, president of Johns Hopkins University, was elected president. The other officers are: Vice-presidents, Dr. G. Beilby, Eustace Carey, Dr. J. T. Dunn, E. G. Hooper, A. P. Ling, Prof. R. Meldola, Dr. R. Messel, Sir Poverton Redwood, W. F. Reid, G. C. Stone, Dr. T. B. Wagner, and R. C. Woodcock; secretary, C. G. Creswell; treasurer, Thomas Tyrer; and foreign secretary, Dr. Ludwig Mond.

An Attorney on the Status of the New York Board of Pharmacy.

Ever since Governor Hughes in his message to the recent session of the State legislature expressed a doubt as to the legal standing of the New York Board of Pharmacy, a similar doubt has arisen and grown in the minds of many druggists of the State. And not only the standing of the board but its methods have been questioned. Out of such questioning arose the subjoined correspondence in which R. S. Conklin, attorney and a member of the last legislature, expresses his opinion relative to the standing of the board in a court of law.

Under date of July 1st, Thomas Lamb, of Brooklyn, as secretary of the Retail Druggists' Protective Association, wrote to Mr. Conklin as follows:

Dear Sir:—As you are doubtless aware, I was one of the supporters of William T. Creagan in the recent Brooklyn election on members of the State Board of Pharmacy.

We claim that Mr. Creagan received a clear majority of the votes cast by druggists who were properly entitled to participate in the election.

The election inspectors who are appointed by the State board of pharmacy for the eastern section have declared that Dr. Anderson, who was Mr. Creagan's opponent, received 358 votes to 226 for Mr. Creagan. But of the 358 votes of Dr. Anderson, if he received that number, 148 were cast by members of the Interborough Pharmaceutical Association, although we vigorously protested against their being received.

The Interborough association was incorporated several years ago by the attorney for the board of pharmacy to permit students and clerks just out of college to participate in the election of 1904. In that election it cast about 40 votes. It has never been heard of since until election day of this year. It has never held a meeting since its organization. It has no by-laws, and, so far as I can learn, no constitution.

Those who voted as members were not required to make formal application for membership. No vote of the association was ever required to make a man a member. If he was thought "safe" he was simply sent a post card stating that "Bearer is a member in good standing of the Interborough Pharmaceutical Association," and signed by the secretary. On presentation of this card to the election inspectors the "member" was permitted to vote. Some of the "members" did not even know the name of the association. All other associations were required by the board of pharmacy to submit a copy of their by-laws and constitution, and lists of their members before polls were opened. This was not required by [1] the Interborough. Those who called themselves "officers" of the Interborough were permitted to use their list of members and add names to the same one hour and ten minutes after the polls were opened, and it was only when they flagrantly took a man who had no card into a private room to issue one to him that our protests were heeded and the list was given over as final to the chairman of the election board.

We ask your opinion in view of these illegal proceedings, as to what can be done towards securing for Mr. Creagan the recognition which rightfully belongs to him as a member of the State board of pharmacy.

Mr. Conklin's reply is dated July 20th and is as follows:

Dear Mr. Lamb:—I have received your communication in reference to the recent election for member of the State board of pharmacy held in Brooklyn, and have given careful consideration to the protests which you make against the conduct of the election officials and the admission of the members of the Interborough association to vote. In accordance with your request for my opinion as to your rights in the matter, I submit the following:

Apart from all other considerations, it would seem that if the facts are as you state them, and that some one hundred and fifty members of the Interborough association were permitted to vote, that this in itself would be sufficient ground on which to base a contest against the admission of Dr. Anderson to membership in the board of pharmacy. I do not believe that any court would so construe the law as to find in it warrant for the voting of such fake associations as this. It surely could not have been the intention of the legislature which enacted this section to include under the term "associations" organizations which existed on paper only, and whose members had no cognizance of their status as members until they received from some mysterious source cards which permitted them to participate in elections of members to the State board of pharmacy. It is amazing that men of such high character as Dr. Anderson would tolerate such disgraceful proceedings.

Apart from this, however, I find the law governing elections curiously indefinite. Sub-divisions 3 and 4 of section 230, of article 2 of the public health law, provides that there shall be elections of members of the State board of pharmacy in the eastern section, and that such elections shall be by the vote of members of an incorporated pharmaceutical association; further, that the State board of pharmacy shall designate a day in June, and a place at which the election shall be held, and shall give fifteen days' notice of the time and place to the associations. But neither in these sub-divisions nor anywhere else in the statute law of the State that I can find, is there any other provision governing the election of members of the State board of pharmacy. It has, as I understand it, been the custom of the board of pharmacy to appoint a board of election inspectors, tellers and poll clerks, and a board of canvassers to announce the result of the election. There is no warrant for such action by the board of pharmacy. These election officials who have heretofore officiated have no more standing than would any other private citizen. Their decision as to who are or who are not entitled to vote is binding on no one; their declarations of the result of an election have no force or effect.

It seems, therefore, that it is not possible to bring quo warranto proceedings in behalf of Mr. Creagan to test the title of Dr. Anderson's office, because there is no title. There are no election officials who have the authority to declare the result of an election, or who have the authority to confer any title, and quo warranto proceedings can only be brought to test the title to an office.

There can be no certiorari proceedings, because certiorari proceedings can only be brought to review proceedings of some board which by law is given power to act. There is no such board in existence in this case. It, therefore, appears that neither Dr. Anderson, nor any member of the State board of pharmacy for the eastern section, at least, has any title to his office, and the gentlemen who at present represent themselves as constituting the State board of pharmacy for this section are nothing more nor less than a body of private citizens who pretend to the possession of an official status, and collect fees under such pretence.

I am aware that this will seem at first an amazing situation. I admit that it is remarkable that it should have continued for some eight or nine years, but I cannot find after the most careful investigation that the board holds office by virtue of any other claim than their own unsupported assertion that they were elected to the same.

I have taken this matter up with New York State Attorney General O'Malley, and he agrees with me that the law is astonishingly inadequate and indefinite, and he has, as yet, been unable to find any grounds for dissent from the construction that I have placed upon it. He is now looking into the matter, and we will shortly confer and determine upon some course of action.

I have also called the matter to the attention of Governor Hughes, and have received notice from him that he is also considering this remarkable state of affairs.

The law does not declare what shall be an "incorporated pharmaceutical association"; it does not even provide that election shall be by a majority vote, and so, for all that appears, the board of pharmacy might make rules and regulations requiring a unanimous vote, rather than a majority vote of the members of the pharmaceutical associations, and in the absence of any new election, perpetuate themselves in office forever.

To my mind the board has no authority to collect a single dollar as a fine or penalty. It has no power to collect, and it is a question whether it would not be an offense for it to receive any money as a registration fee; and it has no power to hold examinations or to issue any licenses to practice pharmacy. If I am correct it will be apparent that it is unfortunate that the representatives of the State pharmaceutical association opposed any legislation at Albany last winter in order that the present board might be continued in control of pharmaceutical affairs, and it is very apparent that prompt action by the next legislature will be necessary in order that the laws governing the practice of pharmacy may be enforced, and licenses issued to those desiring to practice, or to those who are now practicing under what they believe to be valid licenses from the present board.

New York Board Loses on a Technicality.

When at the last session the New York legislature enacted the consolidated laws which were approved by the governor February 17th, it thereby repealed a number of existing laws, among them, chapter 667 of the laws of 1900—the State pharmacy law. Instead of that chapter there was placed upon the statute books article 11 of chapter 45 of the consolidated laws, differing from chapter 667 of the laws of 1900 only in a few minor details.

June 9th last the New York Board of Pharmacy brought suit against Barney Mishking, of Brooklyn, alleging three violations of the pharmacy law to have been committed by him November 21st, 1908, to wit, the sale to an inspector of the board by an unregistered employee of some tincture of iodine containing, according to the contention of the board, approximately 5.56 per cent. of iodoine and 3.9 per cent. of potassium iodide; and some liniment of soft soap alleged to contain methyl alcohol. But one penalty, \$25, was sued for.

The case was tried before Justice Benjamin Hoffman in the third district municipal court. In deciding against the board and dismissing the suit, Judge Hoffman held that the action for the recovery of the penalty did not lie against the druggist, because at the time of the commencement of the suit the law relating to it had been repealed.

Steiner & Peterson, counsel for the board, held that the repeal of the law did not deprive the board of the right to sue for a penalty upon a violation committed previous to the repeal.

Bernhard Ginzburg, counsel for the defendant, argued that no action could lie because the suit was only for a penalty and with the repeal without a saving clause of the statute creating the offense the cause of action abates.

Counsel for the board have stated their intention to appeal from the decision, averring the application of the general construction law of the consolidated laws, which they say continues the right of action under any of the repealed sections, unless other provision is made.

Counsel for the defense says that the case could have been won on its merits, and has a chemist's certificate rebutting the statements of the chemist for the board.

The New York College.

In his report as dean of the college of pharmacy to the president of Columbia University for the academic year ending with June, Dr. H. H. Rusby touches upon a number of points of interest to pharmacy in this State and nation. He begins his report with the following comment on the legislative situation:

An event of great interest and importance to the college has been an attempt to secure a revision of the pharmacy law of this State. This attempt, embodied in the Brown bill, was made in response to a recommendation by Governor Hughes, who has taken a deep interest in pharmaceutical affairs, as well as to a demand from the progressive elements in pharmacy. The important feature of the Brown bill, from an educational point of view, was that of placing the examination and licensing of pharmacists, as well as their education, under the immediate control of the State education department. The bill contained many other provisions causing it to appeal strongly to our approval, but, unfortunately, as a result of hasty and ill-considered action, it misrepresented both its author and its friends in the form of its final passage by the legislature, and met a well-deserved veto. Owing to the fact that this attempt is certain to be at once repeated, under more favorable auspices, it still claims our close attention.

The dean refers with apparent satisfaction to the "reformation" in pharmaceutical education—which, it should be said in justice to him and the institution he represents, he took the leading part in bringing about.

A strong desire for more instruction and better opportunities is noted among the students in the university class in pharmacy, and means of giving them this are discussed.

As a better grade of students is secured and the course in pharmacy is advanced, more use is made of the library and museum; therefore more books, journals, and specimens are needed, and more room in which to keep them.

The food-and-drug course at the college, now three years old, continues to be of special interest.

New instructors have been provided in the pharmacy and chemistry departments.

Dean Rusby has a good deal more to say, and concludes thus:

The notable generosity of American donors to educational work leaves something to be desired in the judgment that is displayed in its exercise. Assistance is too often denied to those stages during which its usefulness would be multiplied. Long periods of crippled effort are entailed through neglect at the time when aid is most needed. When those who have struggled at a disadvantage until a final and tardy success has been attained have passed away, assistance is apt to be showered as a reward upon those who have occupied no other relation to the struggle than that of becoming its beneficiaries.

German Apothecaries' Outing.

Compacted yet congenial was the gathering of German apothecaries, their families and friends at the sommer-ausflug of the New York German Apothecaries' Society at Witzel's Pavilion, College Point, L. I., July 8th, compacted, because of the limited extent of the grounds; congenial, because congeniality is characteristic of the G. A. S. and its affairs. Even the weather man, who too often disappoints the society, was all smiles throughout the day.

The bowling alleys were fine, and in the individual contests excellent scores were made by women and men, and the prizes were closely contested for. The form displayed in the match between the Friday Bowling Club and the Thursday Bowling Club, was not of a gold-medal standard, but was good under the conditions. The Friday Club won by 739 points to 592.

There were races for the women and children; an excellent supper; and enjoyable dancing until midnight.

Philadelphia Association.

For a mid-summer gathering there was a representative attendance at the meeting of the Philadelphia Association of Retail Druggists held July 2d.

After considerable discussion the Pennsylvania Railroad was decided upon as the route to be taken to the Louisville meeting of the National Association of Retail Druggists.

There was some lively discussion following the reading of the report of the legislative committee by W. L. Cliffe. The new restrictions on the sale of phenol gave rise to many questions. It was deemed advisable to acquaint the public through the newspapers, with the limitations that now attend the sale of this poison.

W. E. Lee presented an interesting report of the delegation to the meeting of the Pennsylvania association.

The Wampole matter (see last month's CIRCULAR, page

379) again came up through the receipt of a letter of explanation from the concern in question. In the opinion of those present the explanations did not explain, and the secretary was instructed so to inform the company and to advise it to proceed against any druggists known to it to have been guilty of the alleged substitution.

Reporting for the entertainment committee, H. A. Nolte said that the proceeds of the recent minstrel show and dance were \$400.

Other matters discussed were store-lighting and advertising-commissions.

Explaining the Ohio Law.

R. W. Dunlap, the Ohio dairy and food commissioner, tempers somewhat his just administration of the State food and drugs law with a merciful consideration of those affected thereby. He makes an effort to remove all ambiguity from the phraseology of the law and to state clearly his interpretation of its provisions.

In a recent bulletin the commissioner cautioned the druggists about the method of keeping spirit of nitre, tincture of ferric chloride, solution of hydrogen dioxide, lime water, and ammonia water. He also advised strict adherence to the official processes and standards for bay rum, and tincture of iodine.

Relative to the use of methyl alcohol in preparations for external use he said: "Druggists, in former years, to some extent used wood alcohol, under such names as 'eagle spirit' and 'columbia spirit,' being assured by the manufacturers and their agents that the same could be used in medicinal preparations intended for external application only. The Pharmacopœia recognizes but one alcohol, ethylic or grain alcohol, for use in its preparations.

The Ohio law now prohibits the use of wood or methyl alcohol in any medicinal preparation, whether it is a U. S. P. or National Formulary preparation, or any 'patent' or proprietary preparation, whether for man or beast, or for internal or external use."

Hoffmann's anodyne is defined by the commissioner as compound spirit of ether; Hoffmann's drops in Ohio, means spirit of ether.

As to the proper labeling of drugs the commissioner said: "These features of the law [with regard to the specified substances whose presence must be declared, and the use of misleading names or devices on labels] are intended to and do cover all packages whether sold at wholesale or retail, and dealers selling goods in packages smaller than the original packages in which they are received should see that the law is complied with as to such retail packages, so that the purchaser who is to use the preparation may have the labeling required by law, before him and have the information the law contemplated he should have. The amended law requires all drugs containing alcohol, morphine, etc., to have the quantity or proportion therein stated on the label. Many labels have been found which read as follows: 'Contains not more than 50 per cent. alcohol.' Such labeling is incorrect. The label should state a definite amount."

Medico-Pharmaceutical Organization in Ohio.

An important advance toward higher pharmacy was made in the organizing of a medico-pharmaceutical section of the Cleveland (O.) Academy of Medicine. The organization meeting was held June 25th, the following officers being elected: Chairman, L. C. Hopp; vice-chairman, M. G. Tielke; secretary, Dr. J. B. McGee; and counselor, Dr. L. J. Tuckerman.

The purpose of the new section will be to foster the education of both physician and pharmacist with regard to official preparations, and to improve the relations between the two professions. Doctors and druggists have an equal voice in the affairs of the section.

At the June meeting the following papers were presented: "The Use of the Section to the Medical Profession," by Dr. H. W. Rogers; "The Use of the Section to the Pharmaceutical Profession," by L. C. Hopp; and "The Important Official Flavoring and Coloring Vehicles," by H. V. Army.

Anton Gates, Lafayette and Erie streets, Toledo, Ohio, against whom a charge of illegal cocaine-selling was brought and later dismissed quietly by a deputy State food and dairy commissioner, has brought suit against that official claiming \$5,000 damages.

News of the State Associations.

August Meetings of State Associations.

CALIFORNIA, 13th and 14th, at Los Angeles.

NORTH DAKOTA, 3d and 4th, at Grand Forks.

SOUTH DAKOTA, 18th to 20th, at Lead.

Iowa Association.

Ottumwa was overrun with druggists during the thirtieth annual meeting of the Iowa Pharmaceutical Association held there July 6th to 8th, because a greater-than-ever-before portion of the 633 members of the organization were present at this year's gathering. To secure additions to the foregoing figures the association decided to send to every non-member druggist in the State a copy of the printed Proceedings for this year.

Treasurer J. B. Webb, of De Witt, reported the goodly sum of \$1,256.90 in the association's strong-box.

This year's meeting was replete with interesting addresses and reports. In addition to the annual message of President J. L. Franken, of Sigourney, the members listened to a talk on pharmacology, assaying, and pharmaceutical ethics, by Dr. Chase, of the University of Iowa; one on the recent drug legislation of the State, by J. W. Clements, of the Iowa board of pharmacy; and another by C. M. Carr, editor of the *Journal of the National Association of Retail Druggists*, on propaganda, price protection, and legislation.

Miss Zada M. Cooper, of Red Oak, reported for the committee on adulterations. Prof. W. J. Teeters, of Iowa City, reported as the delegate to the 1908 meeting of the American Pharmaceutical Association.

The report of the committee on queries was read by H. T. Fish, of Mediapolis. The committee had secured papers on the suggested subjects, as follows: "The Requirements for Success in the Retail Drug Business," by J. G. Baker, of Dubuque; and W. F. F. Hunger, of Titonka. "Proposed Legislation in the Last Iowa Legislature for the Re-organization of the Pharmacy Commission—Is a Change Desirable?" by E. M. Burns, of Mason City; "Publicity and Prominence—Window Displays, Pamphlets, Newspaper Advertising—Which Is the More Productive of Results?" by W. F. F. Hunger, of Titonka; "Co-operation Between Physicians and Pharmacists—the Advantage, and How Best to Bring It About," by Zada M. Cooper, of Red Oak; and W. F. F. Hunger, of Titonka; "The Drug Store the Ladies Patronize, and Why," by Zada M. Cooper, of Red Oak; Dorothy Gerlach, of Carroll; Mrs. H. T. Fish, of Mediapolis; Mrs. M. C. Nix, of Marshalltown; and Mrs. W. F. F. Hunger, of Titonka.

A very complete series of entertainments supplemented the business of the convention, and ample opportunity was afforded for those gifted athletically, sartorially, physiognomically, and a la Terpsichore to secure valuable prizes.

Officers and delegates were elected as follows: President, F. B. Clark, of Ottumwa; vice-presidents, Miss Zada M. Cooper, of Red Oak; H. T. Fish, of Mediapolis; and J. G. Stanley, of Dexter; secretary, J. M. Lindley, of Winfield; treasurer, J. B. Webb, of DeWitt; executive committee, N. F. Reed, of Ottumwa; E. M. Burns, of Mason City; and A. C. Wilson, of Oelwein; delegates to the A. Ph. A., W. J. Teeters, of Iowa City; Mrs. Fletcher Howard, of Des Moines; J. L. Etzel, of Clear Lake; and T. W. Route, of Dubuque; delegates to the N. A. R. D., R. W. Harvey, of Missouri Valley; G. H. Boynton, of Cedar Rapids; and F. L. Michael, of Mason City.

Des Moines was selected as the 1910 meeting place.

Kentucky Association.

The thirty-second annual meeting of the Kentucky Pharmaceutical Association held at Cerulean Springs, June 15th to 18th, was one of the most successful and profitable in the history of the organization. One hundred and fifty members were present, and the sessions were characterized by a large attendance, close attention and interesting discussions covering a wide range of timely topics. Plans were begun for enrolling if possible every druggist in the State, it being recognized that a more representative body was needed if the desired amendments to the pharmacy law were to be secured.

In voting to reaffiliate with the National Association of Retail Druggists, an enthusiastic endorsement of the work and policies of the national organization was pronounced.

A motion to the effect that the annual dues be increased

from \$1 to \$2 was lost. A motion was carried recommending that efforts be made to have the pharmacy law amended to provide for the registration of assistants in pharmacy and apprentices, with a strong feature regulating the sale of medicines by itinerant vendors.

Officers for the ensuing year were elected as follows: President, G. L. Penny, of Stanford; secretary, J. W. Gayle, of Frankfort; treasurer, Vernon Driskell, of Ghent; and chairman of the executive committee, J. T. Elam, of Henderson.

The next annual meeting will be held at either Olympian Springs or the Mammoth Cave, to be determined by the executive committee.

Maine Association.

In celebrating its forty-second birthday at Portland, June 29th to July 1st, the Maine Pharmaceutical Association demonstrated its activity by adding to its already large membership some forty persons.

Much to the regret of the members, W. I. Drew, of Portland, who had been the treasurer of the association for twelve years, declined re-election. Appreciation of his services was shown by the adoption of commendatory resolutions. The office of treasurer was combined with the secretaryship.

After six men had been selected for nomination to the governor in his selection of a member of the board of pharmacy to succeed C. H. Davis, of Bangor, five of the candidates withdrew in favor of F. T. Crane, of Machias, and he was then unanimously endorsed.

Sailing, base-balling, dining and pic-nicing furnished entertainment after business.

Officers and delegates were elected as follows: President, John Coughlin, of Augusta; vice-presidents, C. H. Davis, of Bangor; G. O. Tuttle, of Portland; and H. T. McClearn, of Boothbay Harbor; secretary and treasurer, M. L. Porter, of Danforth; executive committee (in addition to the officers), F. W. Buckman, of Skowhegan; and E. W. Murphy, of Portland; delegates to the American Pharmaceutical Association meeting, John Coughlin, C. H. Davis, Herschell Boynton, J. A. Broe and C. H. Bane; delegates to the United States Pharmacopœial Convention, C. H. Davis, F. R. Partridge and E. S. Everett.

Maryland Association.

The twenty-seventh annual meeting of the Maryland Pharmaceutical Association held at Ocean City, June 22d to 25th, brought together a larger number of druggists than has attended similar gatherings in years. In point of interest, too, the sessions were ahead of many previous ones, and the stay of the members by the seaside was rendered enjoyable by fine weather and various diversions.

Much interest was manifested in the annual address of President W. M. Fouch, of Baltimore. He counseled co-operation among the various divisions of the drug trade as an essential factor in the accomplishment of results, and pointed out that the State association was peculiarly fitted to undertake the work of promoting pharmacy legislation and other matters because of its being composed of representatives of all branches of the business. He suggested that a general council be formed, consisting of delegates from all the other organizations, one delegate to be named for each fifteen or so members, and that a certain per capita tax be imposed on the members of the various organizations as a fund with which the State association could defray the expenses of the work conducted by it. The suggestion was received with much favor, and the other bodies will be requested to give their views on the several propositions.

The report of Secretary E. F. Kelly, of Baltimore, showed that the association had gained in membership and is stronger than ever. Fourteen druggists had been admitted into the organization during the year. The financial condition was also reported to be highly gratifying.

The papers read included the following: "Substitutes for Iodine," by Dr. Herman Engelhardt; "The Manufacture of Glass, from a Chemical and Physical Standpoint," by P. I. Heusler; "A Remarkable Pharmacist," by Prof. Daniel Base; "Nine Prescriptions," by H. A. B. Dunning; "Some Necessary Amendments to the Pharmacy Law," by Louis Schulze; "Permanence of Galenical Preparations," by Dr. A. R. L. Dohme; "Sulphurous Acid," by H. A. B. Dunning; and "Soluble Elastic Capsules," by J. J. Barnett.

The committee on legislation, in its report, recommended that a pure food and drug bill, drawn on the lines of the Federal statute, be submitted at the sessions of the next

Maryland general assembly. In this request is reflected the attitude of the drug organizations of the State.

Officers were elected as follows: President, J. B. Thomas, of Baltimore; vice-presidents, W. C. Aughinbaugh, of Hagerstown; W. J. Lowry, of Baltimore; and E. R. White, of Salisbury; secretary, E. F. Kelly, of Baltimore; treasurer, J. W. Westcott, of Baltimore; executive committee, R. E. L. Williamson, W. M. Fouch and J. E. Bond, all of Baltimore.

The speakers at the annual banquet included the new president, who gave a forecast of the work to be done during the next year; H. F. Baker, president of the Baltimore Drug Exchange; A. C. Meyer, who spoke on "Legislation of Interest to the Pharmacist"; Prof. Daniel Base, on "The Baltimore College of Pharmacy"; and C. L. Henry.

Massachusetts Association.

About 700 persons were in attendance at the twenty-eighth annual meeting of the Massachusetts Pharmaceutical Association at Swampscott, when the first session was called to order on the afternoon of June 22d. Before final adjournment was taken on the 24th, this number had been increased to almost a thousand.

After the formal greetings were over President E. L. Leonard, of Springfield, read his annual address, a masterful handling of the pharmaceutical topics of the day. His recommendations were as follows: (1) That the association submit to the governor the names of three candidates for this year's vacant position on the board of pharmacy; (2) that efforts be continued to have a pharmacist on the State board of health and that the names of three candidates be submitted to the governor; (3) that the maintenance of the association's scholarship at the Massachusetts college be continued; (4) that affiliation with the National Association of Retail Druggists be continued and two delegates sent to the 1909 meeting; (5) that appropriate tribute be paid to the memory of J. H. Manning; (6) that the legislative committee be empowered to employ counsel; (7) that the association withdraw from membership in the State board of trade; (8) that three delegates be sent to the pharmacopoeial convention; (9) that the association adopt the resolutions recently adopted by the Pittsburg (Pa.) branch of the American Pharmaceutical Association (see the CIRCULAR for June, page 310); and (10) that a committee of three or five be appointed to study the liquor-law problem, and existing conditions with a view to determining the advisability of changing the law of the State.

The committee to which this address was referred recommended the approval of the president's recommendations with the exception of the last two. In lieu of the tenth, the committee advised the referring of the liquor question to the legislative committee. The association concurred in the recommendations of the committee.

The reports of Secretary J. F. Guerin, of Worcester, and Treasurer T. B. Nichols, of Salem, proved conclusively that the association had experienced during the past year the most prosperous era of its existence. One hundred and forty-seven new members were enrolled at the meeting.

A paper by J. A. Gilman, of Boston, on "The Changes That Have Taken Place in the United States Laws Governing Proprietary Remedies" was received with well-merited commendation. Prof. Patch, of Worcester, lectured on "Darkest Africa."

For the governor's consideration in selecting a successor to L. A. Lamson, of Hopedale, who retires from the board of pharmacy this year, the association nominated W. S. Flint, of Worcester; H. T. Carson, of New Bedford; and P. S. Moriarty, of Worcester.

W. N. Curtis, of Roxbury; L. G. Heinritz, of Holyoke; and L. A. Lamson, of Hopedale, were nominated for the consideration of the governor in selecting a member of the board of health.

E. O. Engstrom, of Pittsfield; C. F. Nixon, of Leominster; and F. A. Hubbard, of Newton, were selected as delegates to the United States Pharmacopoeial Convention.

Officers were elected as follows: President, J. F. Finneran, of Boston; vice-presidents, A. J. Brunelle, of Fall River; H. A. Barnard, of Marlboro; and F. J. Campbell, of Lowell; secretary, J. F. Guerin, of Worcester; treasurer, T. B. Nichols, of Salem; trustees, W. F. Sawyer, F. E. Mole and G. S. Roskell.

A burlesque ball game and other athletics, cards, vaudeville, dancing and a sumptuous banquet were the features of the lighter side of the meeting.

Michigan Association.

Detroit, in the opinion of the members of the Michigan Pharmaceutical Association, which met there June 22d to 24th, has reason to boast of its qualifications as a convention city—it certainly made good to the drug men.

Legislation, accomplished, hindered and unaccomplished formed the chief topic in the address of President M. A. Jones, of Lansing. The pharmacological phase of the liquor question under the new State local option law was touched upon by the president and came up for discussion later, after the report of the legislative committee, read by A. L. Walker. The new anti-cocaine law and the State food and drugs act were also discussed in detail.

C. F. Mann, of Detroit, reported for the trustees of the Prescott memorial fund, and collected \$67 at the meeting. The association appropriated \$200 to the fund.

Prof. L. E. Sayre, of Lawrence, Kan., was a visitor to the meeting and spoke upon the liquor question from the Kansas viewpoint. A paper on "Local Option" was read by J. W. Cobb, of Birmingham. Other papers presented were: "Mailing Lists and How To Use Them," by A. G. Lyon, of Coldwater; "Side Lines in Pharmacy," by F. C. Cahow, of Reading; "Building of a Candy Business," by W. M. C. Scott, of Detroit; "Your Cigar Case as an Asset," by C. A. Weaver, of Detroit; and "Aspirin and Acetylsalicylic Acid," by J. O. Schlatterbeck and A. W. Linton.

Officers were elected as follows: President, E. J. Rodgers, of Port Huron; vice-presidents, R. B. Campbell, of Three Rivers; T. A. Goodwin, of Ithaca; and O. A. Fanchboner, of Grand Rapids; secretary, E. E. Calkins, of Ann Arbor; treasurer, Willis Leisenring, of Pontiac; executive committee, M. A. Jones, of Lansing; C. A. Weaver, of Detroit; A. G. Lyon, of Coldwater; Martin Goodale, of Battle Creek; and F. C. Cahow, of Reading; delegates to the meeting of the National Association of Retail Druggists, E. E. Calkins, of Ann Arbor; and Charles Frantz, of Bay City.

Minnesota Association.

Although it was formed in 1883, no annual meeting of the Minnesota Pharmaceutical Association was held until two years later, so that this year marked the silver jubilee of the organization, and the event was duly celebrated at the meeting held June 16th to 18th, at Tonka Bay. At the end of its first quarter-century the association, according to the report of Secretary T. F. Leeb, of Winona, had reached a membership of 502. To this were added 39 new members at this year's meeting.

Treasurer L. J. Aberwald, of St. Paul, reported that the association started out on its second quarter-century with \$94 in its pocket.

Too much apathy toward matters legislative exists among the druggists of the State was the opinion expressed in the annual message of President G. H. Goodrich, of Anoka. He called upon them to rouse and rally, and recommended that the legislative committee be better equipped financially. He praised the progressiveness of the college of pharmacy and urged pharmacists to take up post-graduate work when possible. The board of pharmacy and the co-operative manufacturing concern allied with the association were highly commended in the address. Propagandic work, fire insurance and a larger association were his other topics.

The committee to whom the president's address was referred endorsed his recommendations, and in turn recommended that 20 per cent. of the annual dues collected be appropriated for the use of the legislative committee. The position taken by the committee was approved by the association.

Mr. Whipple, of the organization force of the National Association of Retail Druggists spoke about the propagandic work of the N. A. R. D., and the use for a country-wide campaign against the traveling pedler of drugs. The Minnesota association re-affirmed its allegiance to the N. A. R. D. and will send three delegates to the 1909 meeting. Co-operation with other mercantile organizations was decided upon, with the intention of combatting the itinerant vender evil.

Stewart Gamble read the report of the committee on legislation. The report of the committee on adulterations was read by G. Bachman. C. H. Huhn reported for the committee on fire insurance.

Addresses were made by Prof. F. J. Wulling, W. G. Noyes, Hon. Donald Robertson, and Dr. Brown, of the University of Minnesota.

H. W. Rietzke, J. P. Jelinek and C. F. Rutherford, all

of St. Paul; A. J. Kline, of Minneapolis; and H. T. Holverson, of Alexandria, were nominated for the consideration of the governor in his selection of a member of the board of pharmacy.

Officers were elected as follows: President, A. D. Thompson, of Minneapolis; vice-presidents, J. P. Jelinek, of St. Paul; K. G. Skartum, of Lake Benton; and Truman Griffin, of Minneapolis; secretary, T. F. Leeb, of Winona; treasurer, L. J. Aberwald, of St. Paul; executive committee, A. C. Le Richeux, of Duluth; J. F. Danek, of Minneapolis; and H. T. Holverson, of Alexandria.

Mississippi Association.

Twenty-nine names were added to the membership roll of the Mississippi Pharmaceutical Association at the seventh annual meeting held June 17th and 18th, at Vicksburg. Five persons were elected to honorary membership.

The legislative committee was instructed to use its efforts to have the extra tax on caffeine soda-fountain drinks removed.

Papers were read as follows: "The Prescription Case," by J. G. McGee, of Jackson; "Sunday Closing," by J. F. Norwood, of Tylertown; "The Promiscuous Use of Proprietarys by the Medical Profession," by A. Fly, of McComb City; and "Education as a Prerequisite to Board Examination," by A. S. Coody, of Osyka.

For the ensuing year the association elected the following officers: President, A. S. Coody, of Osyka; vice-presidents, Steven Platt, of Vicksburg; and A. P. Craig, of Indianola; secretary, O. W. Bethea, of Meridian; treasurer, J. W. McCorkle, of Meridian; executive committee, A. H. Bradshaw, of Summit; A. Fly, of McComb City; and B. L. Clark, of Kosciusko.

Next year's meeting will be held at Natchez.

Missouri Association.

Eighty pharmacists, sixty-six salesmen and about one hundred visitors were attracted to Joplin, by the thirty-first annual meeting of the Missouri Pharmaceutical Association held there June 15th to 18th. The membership roll was increased by 106 new names.

No other topic occasioned so much discussion as did the new State pharmacy law. This differs little from the old law in any material portion, with the exception that re-registration is provided for, and the grade of assistant pharmacist established.

Much interest was manifested in the reading of the following papers: "Can Drug-Store Hours Be Shortened and Sunday Closing Extended," by H. O. A. Huegel, of St. Louis; and F. G. Uhlich, of St. Louis; "General Replies to Questions Submitted by the Committee on Papers and Queries," by J. G. Geiwitz, of St. Joseph; "Our Past Presidents," by F. R. Dimmit, of Kansas City; "Suggestions on Membership," by C. E. Meyer; "The 1883 Meeting of the Missouri Pharmaceutical Association," by Dr. H. M. Whelpley, of St. Louis; "Suggestions Wanted for Our New Board of Pharmacy," by Francis Hemm, of St. Louis; and H. W. Servant, of Sedalia; "Mexican Medicine," by J. F. Llewellyn, of Mexico (Mo.); "What Constitutes a Reputable College of Pharmacy from the Viewpoint of the Missouri Pharmaceutical Association?" by L. R. Suppan, of St. Louis; "Is Commercial Pharmacy Instruction in Our Colleges Doing Good?" by L. Lieberstein, of St. Louis; and "The 1884 Meeting of the Missouri Pharmaceutical Association," by Dr. H. M. Whelpley.

In addition to that of A. Brandenberger, of Jefferson City, the outgoing member, the names of William Mittelbach, of Booneville; W. C. Bender, of St. Joseph; C. E. Zinn, of Kansas City; and Frank Edel, of Carthage, will be submitted to the governor for his consideration in selecting a member of the board of pharmacy.

Officers were elected as follows: President, W. K. Ilhardt, of St. Louis; vice-presidents, A. Burvenich, of St. Joseph; H. O. A. Huegel, of St. Louis; and W. J. Leffen, of Joplin; treasurer, William Mittelbach, of Booneville; permanent secretary, H. M. Whelpley, of St. Louis; assistant secretary, W. C. Bender, of St. Louis; local secretary, E. G. Orear, of Maryville; council, D. V. Whitney, of Kansas City; C. L. Wright, of Webb City; W. H. Lamont, of St. Louis; P. L. Hess, of Kansas City; O. F. Claus, of St. Louis; (the president, permanent secretary and treasurer are members ex-officio.)

The next meeting will be held at Maryville, June 14th to 16th, 1910.

Nebraska Association.

Mayor Love, of Lincoln, welcomed with some good advice the Nebraska Pharmaceutical Association, which met at that city, June 15th to 17th. He urged the druggists to purge their ranks of the sellers of habit-forming drugs, and called upon them to keep the drug trade free from the taint of liquor selling.

Governor Shallenberger, Food Commissioner Mains and State Chemist Redfern addressed the meeting, dwelling particularly upon the working of the State pure food and drugs law and pure paint law.

President O. W. Beckwith, of Beatrice, in his annual address, made a plea for a shorter drug-store day.

Prof. H. P. Hynson, of Baltimore, Md., delivered an address on "The Pharmacopoeia and the National Formulary," and was elected an honorary member of the association. There was a paper on the necessity of pharmaceutical education, by Dr. R. A. Lyman, of the University of Nebraska school of pharmacy; another by Frank McBride, a ten-year-old drug clerk; and one by Dr. Minnick, of Palmer, touching on the question of the scarcity of clerks.

The legislative committee was advised to work for the enactment of a law prohibiting the refilling of prescriptions calling for habit-forming drugs; and one levying a tax of \$100 per month on traveling medicine peddlers.

A. M. Bradshaw, D. P. Killen and George Jerome were recommended to the governor as properly qualified board of pharmacy timber.

Delegates were appointed as follows: To the 1909 meeting of the American Pharmaceutical Association, E. H. Dart, Frank Pease, C. L. Kreitzinger, J. L. Frater and R. A. Lyman; to the 1910 Pharmacopoeial Convention, C. R. Sherman, A. V. Pease and N. P. Hansen.

The following officers were elected: President, D. J. Fink, of Holdrege; vice-presidents, Fred Laffin, J. E. Harper, F. Hinkle, A. L. Gordon, and R. A. Lyman; secretary, J. D. McBride, of Stella; and treasurer, D. D. Adams, of Nehawka.

New Hampshire Association.

The attendance at the thirty-sixth annual meeting of the New Hampshire Pharmaceutical Association held at The Weirs, June 29th and 30th, was not so large as at some former conventions, but in many respects the meeting was the most successful the association has ever held.

In his annual address, President G. A. Gilmore, of Epping, gave a review of the work done during the year; commended the legislative committee for its work; and recommended that the association continue its affiliation with the National Association of Retail Druggists and send a delegate to its annual convention. He spoke heartily in favor of the propaganda and urged every one to take part in it.

The reports of Secretary H. E. Rice, of Nashua, and Treasurer S. H. Bell, of Derry, showed that the affairs of the association were in a satisfactory condition. Secretary Rice also presented a report as delegate to the N. A. R. D. convention. C. G. Shedd presented the report of the legislative committee.

One session was devoted to every-day drug-store business topics. Secretary Rice read a paper entitled "What's the Matter with the Drug Business?" also a paper on "Propaganda." These were freely discussed, and a most interesting talk on prescription and drug prices, "own-make" preparations, etc., was indulged in.

On the entertainment program were cards, legerdemain, boating, dancing and trolleying as adjuncts to the annual banquet.

It was voted to continue affiliation with the N. A. R. D. and to send a delegate to the 1909 meeting.

Officers were elected as follows: President, E. M. Allen, of Canaan; vice-presidents, C. J. Whiting, of Raymond; and C. G. Shedd, of Keene; secretary, H. E. Rice, of Nashua; treasurer, S. H. Bell, of Derry; auditor, J. H. Marshall, of Manchester; executive committee, E. C. Bean, of Belmont; H. E. Dunnington, of Manchester; and H. E. Rice, of Nashua.

North Carolina Association.

In the history of the North Carolina Pharmaceutical Association there was never another meeting so largely attended as was the thirtieth annual convention at Greensboro, June 23d to 25th. Not the least reason for the large attendance was the presence of President-elect H. H. Rusby of the American Pharmaceutical Association, who

was given the privilege of the floor and took part in the deliberations of the association; he also entertained those in attendance with an illustrated lecture entitled "Across South America with Mule and Canoe." Dr. Rusby was made an honorary member of the association.

Many interesting papers were read and discussed.

The association voted to continue its affiliation with the National Association of Retail Druggists.

Higher educational qualifications for applicants for registration as pharmacists were favored in a resolution adopted at this meeting.

There was a barbecue and Brunswick stew for the satisfaction of the inner man.

The following are the new officers: President, G. Y. Watson, of Southport; vice-presidents, I. W. Rose, of Rocky Mount; M. T. Payne, of Greensboro; and G. A. Matton, of High Point; secretary, P. W. Vaughan, of Durham; treasurer, G. K. Grantham, of Dunn; executive committee, J. P. Stowe, E. R. Thomas, J. A. Hood and Howard Gardner; and local secretary, J. P. Woodsall, of Charlotte.

The 1910 meeting will be held at Charlotte, June 15th to 17th.

Ohio Association.

T. B. Huston, who had been elected president of the Ohio Pharmaceutical Association at the 1908 meeting, became a resident of Cuba in the meantime and Vice-President C. L. Perry, of Peebles, occupied the chair during the thirty-first annual meeting held at Cedar Point, July 14th to 16th. Some 400 persons attended this meeting, there being about 100 present at every session.

Treasurer J. H. Von Stein, of Sandusky, reported the gratifying balance on hand of \$1,432.77.

The report of Secretary T. D. Wetterstroem, of Cincinnati, showed that the association had made a large increase in membership, a total of 435 having been added during the year. The total membership is 1,124, with 931 in good standing. Six deaths were reported, as were also eight resignations and the dropping of thirty from the roll for non-payment of dues. A recommendation to mail the Proceedings only to members who have paid their dues for the current year was not approved.

Food and Drug Commissioner Dunlap outlined his policy in the conduct of his office and stated that he would expect all drugs and medicines coming under the misbranding clause of the food and drugs act to be properly labeled as to their alcoholic or habit-forming-drug content by January 1st, 1910. The statement of the alcoholic content should be exact, he said, and not "about" or "approximately" so much; he will permit a reasonable deviation from the stated quantity. Commissioner Dunlap's policy was commended and endorsed, and the thanks of the association were given to him.

Mr. McIntire, the new drug inspector, discussed at length county organization. This matter was referred to a committee to report to the council the advisability of organizing county branches of the State association, the council to report to the association at its next annual convention.

The following papers were read: "A Few Observations at the Prescription Counter," by W. E. Kaemmerer; "Pharmacy as a Science," by L. H. Witte; "Formaldehyde Test," by G. D. Beal; "Note on Alkaline Antiseptic Solution," by Prof. H. V. Arny; "Powdered Asafetida," by Azor Thurston; "The Drug Store Cow," by Prof. Joseph Feil; "Should Drugs Used by Physicians be Required to Comply with Legal Standards?" by C. M. Shafer; and "County Organization," by C. S. Ashbrook.

The report on adulteration and sophistication presented by Prof. Arny was interesting and brought out considerable discussion. It was composed of three parts: condition of the drug market, by Prof. Arny; drug adulteration, by Azor Thurston; and codeine sulphate tablet triturations and mail order drugs, by T. D. Wetterstroem.

It was resolved (1) that the association co-operate with the food and drug commissioner in the proper labeling of "patent" and proprietary medicines; (2) that assistance be given to the local committee on pharmacopoeial revision; (3) that the National Association of Retail Druggists be endorsed and supported; (4) that the Wampole letter anent the practice of substitution by druggists be condemned; (5) that the board of pharmacy be supported in the enforcement of certain laws; and (6) that the thanks of the association be voted to Governor Harmon for his recognition of the recommendations of the State association in his selection of members of the board of pharmacy.

Two resolutions were referred to a special committee:

one having to do with the recognition of traveling men as members of the association; the other dealing with the question of the use of sodium benzoate and other preservatives in food-stuffs.

A resolution favoring the enactment of an amendment to the pharmacy law, making a diploma from a school of pharmacy a prerequisite of application for registration, failed of adoption, by a few votes.

M. G. Tielke, of Cleveland; Frank Amann, of Portsmouth; E. C. Davis, of Akron; W. C. Koonen, of Canton; and W. P. Jenkins, of Dayton, were recommended to the governor for his consideration in appointing a member of the board of pharmacy to succeed Mr. Tielke.

Officers and delegates were elected as follows: President, C. S. Ashbrook, of Mansfield; vice-presidents, J. G. Schnuerer, of Cleveland; and J. J. Hauss, of St. Mary's; treasurer, J. H. Von Stein, of Upper Sandusky; secretary, T. D. Wetterstroem, of Cincinnati; and member of council, L. A. Biehl, of Sandusky; delegates to the Pharmacopoeial Revision Convention, L. C. Hopp, T. D. Wetterstroem and G. B. Topping; delegates to the meeting of the American Pharmaceutical Association, C. T. Elder, C. W. Tobey, Azor Thurston, J. H. Beal and G. B. Kauffman.

The next meeting will be held at Cedar Point, July 12th to 15th.

Pennsylvania Association.

Bedford was the scene of the thirty-second annual meeting of the Pennsylvania Pharmaceutical Association, held June 22d to 24th. The meeting was very well attended, an unusually large number of ladies being present, as well as many new members who went to a meeting this year for the first time. An address of welcome was delivered by Congressman John M. Reynolds.

The executive committee in their report turned in the names of 127 new members, this being the largest number of accessions to the membership during any one year for five years, and the third largest in the history of the association.

One of the main features of the meeting was a strong and able address by President Walton, who has presided over the association during a trying year in which unusual efforts were necessary to keep the pharmacists of Pennsylvania from being harassed by unnecessary legislation. The president took advanced ground regarding the sale of morphine and opium, recommending that a bill be drawn providing for closer restriction and regulation. He also recommended that the entertainment committee be provided with funds sufficient to cover the cost of the entertainments at the meetings to the end that begging from wholesalers and others for this purpose should cease. He also recommended an appointment of a committee on U. S. P. and N. F. propaganda with the special duty of assisting county and local organizations when called upon, and to prepare the display of U. S. P. and N. F. preparations for use at the Pennsylvania medical meeting. Another recommendation of President Walton was that the association re-affirm its affiliation with the National Association of Retail Druggists, and this was unanimously approved.

The review of the growth of the Pennsylvania Pharmaceutical Association, contained in President Walton's address, presented very interesting features, showing a great increase in the membership of this association in recent years. In 1902 the membership was 359, the number of papers read at the annual meeting was nineteen, and the balance in the treasury was \$78. In 1908 the membership was over one thousand, the number of papers presented was fifty, and the cash balance on hand \$1,574.09, and the attendance at last year's meeting was the largest on record.

Secretary Potts, of the N. A. R. D., who was present, gave a very complete outline of the aims and purpose of the national association, taking up particularly the U. S. P. and N. F. propaganda.

The report of the legislative committee showed the passage of a pure drug law based upon the national law, and a new cocaine law which is quite drastic. The report of this committee proved to be the storm center of the meeting, some of the members taking exception to the work of the committee, claiming that it was a mistake to allow the variations in strength of official preparations which are allowed in the national law and which were incorporated in the Pennsylvania law. However, the report was accepted with the thanks of the association.

The work of the committee on papers and queries,

Charles H. LaWall, chairman, was particularly meritorious, over forty papers being presented at the meeting, twenty-two of which were read. Among these were papers on legislative matters by Louis Emanuel, H. C. Blair and Louis Saalbach. Other papers which attracted considerable attention were: "The Fluidextract Question," by Frederick J. Blumenschein; "The Assay and Standardizing of the U. S. P. Preparations," by Leo Eliel; "Concerning the Increase of Proprietary Preparations," by William M. Latou; "Lest We Forget," by Prof. C. Lewis Diehl; "Formulas for Some New Basic Elixirs," by George M. Beringer; "Elixir of Gentian N. F.," by George M. Beringer; "The House Divided," by J. Leyden White; "Revision of the Pharmacopœia Every Five Years," by R. H. Lackey; "Some of the Properties of Cadmium," by H. C. Deming; "Standardization the Basis of Professional Pharmacy," by F. E. Stewart; "The Pharmaceutical Journals, Where Are They At?" by B. E. Pritchard; "Clinical Laboratory Work," by Henry C. Blair; "The Quality of Pharmaceuticals," by W. A. Pierson; "On the Commencement of Business," by J. B. Moore; "The Shut-Ins in Drug Stores," by William G. Greenwalt; and "The Solubility of Official Substances," by M. I. Wilbert. A comprehensive paper on the copyright, patent, and trade-mark questions, by F. E. Stewart, was also one of the features of the meeting.

Special obituary services were held in memory of the late Jacob H. Stein, of Reading, and the late Jacob H. Redsecker, of Lebanon, two of the charter members and ex-presidents of the association. Touching tributes were paid to the memory of these departed ones whose influence on pharmacy will live long after them.

Comprehensive reports were received from the committees on trade interests and adulteration.

The officers elected for the coming year were as follows: President, John C. Wallace, of New Castle; vice-presidents, Theodore Campbell, of Philadelphia, and Charles R. Rhodes, of Hyndman; secretary, Edgar F. Heffner, of Lock Haven; treasurer, Joseph L. Lemberger, of Lebanon; executive committee, Louis Saalbach, of Pittsburg; Louis Frank, of Wilkes-Barre; and H. W. Skinner, of Chambersburg; local secretary, Howard J. Mentzer, of Blue Ridge Summit. Lucius L. Walton, of Williamsport, and M. N. Kline and W. L. Cliffe, of Philadelphia, were elected delegates to the 1910 pharmacopœial convention, with D. J. Thomas, of Scranton, and C. B. Lowe, of Philadelphia, as alternates.

Strong resolutions endorsing the course of Dr. H. W. Wiley, chief chemist of the United States department of agriculture, were passed, and the great good done for the American consumer by the work of Dr. Wiley was commended. Governor Stuart and Senator Gerberch were also commended for the help they gave toward defeating the imitation-whisky bill.

The next annual meeting will be held at Buena Vista Springs, June 28th to 30th.

Strong resolutions were adopted condemning the bar tender masquerading as a drug store proprietor.

The meeting closed with the presentation of prizes won by the ladies at the different contests during the meeting, and the installation of the newly elected officers, during which a high tribute was paid to the character and work of the retiring president by his successor.

The entertainment program was the best ever provided by the "three busy bees," Bransome, Byers and Busch. It consisted of a splendid family dinner on Tuesday evening, with special musical features, a masquerade ball on Wednesday evening, and a dance on Thursday. Tallyho parties, automobile rides, card games, and other amusements helped to fill in the time for the ladies attending the meeting.

South Carolina Association.

About 100 members of the South Carolina Pharmaceutical Association attended the thirty-third annual meeting held July 7th to 9th, at Anderson. For results, too, this meeting was noteworthy.

S. C. Hodges reported for the committee on legislation, expressing the belief that the State legislature at its next session would enact the pharmacy law endorsed by the association.

The question of the advisability of organizing county branches of the association was discussed with much interest. The project was endorsed.

A motion was carried, to the effect that each druggist

in the State be assessed \$3 annually to defray the expenses of a secretary for the board of pharmacy, who should canvass the State for the purpose of discovering whether the pharmacy law was being complied with.

Among the papers read were the following: "Ice Cream," by Edward Hahn, of Charleston; "Practical Operation of a Soda Fountain," by O. E. Thomas, of Columbia; and P. L. Barr, of Anderson; "How to Operate a Drug Store," by G. W. Evans, of Anderson; "Relation of Pharmacist to Physician," by F. M. Smith, of Charleston; "A Plea for Botany and Pharmacognosy," by W. H. Zeigler, of Charleston; "By What Means Can We Elevate the Pharmacist's Profession?" by A. A. Coleman, of Greenwood; and "The Relation of the Employer to the Employee," by W. H. Zeigler, of Charleston.

One of the most significant actions of the meeting was the adopting of the following preamble and resolutions:

Whereas, it has come to the attention of the members of the South Carolina Pharmaceutical Association that there is some probability of our next legislature, on account of the counties going dry, placing intoxicating beverages for sale in the hands of the druggists of this State.

Therefore, we in convention assembled at Anderson, South Carolina, put ourselves on record as opposing any law that tends to put in the hands of the druggists the sale of intoxicating liquors, or beverages of any kind, or the responsibility of the sale of same.

Resolved, further, that we instruct our legislative committee to do all in its power to prevent such legislation.

Resolved, that a copy of these resolutions be printed in all the daily papers of the State in order that our position may not be misunderstood.

Thirty-seven new members were enrolled during the meeting.

Delegates were appointed as follows: To the meeting of the American Pharmaceutical Association, W. H. Zeigler, W. C. De Lorme and A. B. Carpenter; to the meeting of the National Association of Retail Druggists, O. A. Matthews.

A smoker-session was held on one evening; and the final session was in the nature of a banquet.

These are the officers for the ensuing year: President, M. H. Sandifer, of Rock Hill; vice-presidents, G. W. Evans, of Anderson; and S. C. Hodges, of Greenwood; and secretary and treasurer, F. M. Smith, of Charleston.

L. P. Fouche, of Anderson, was elected a member of the board of pharmacy; and W. W. Dodson, of Laurens, a member of the board of health.

Glenn Springs was selected as the 1910 meeting place.

Texas Association.

What was perhaps the largest gathering of members of the Texas Pharmaceutical Association thronged historic San Antonio during the thirtieth annual convention held June 15th to 17th. Considered from any side the meeting was one of the most eventful in the history of the association.

A notable gain in membership was made at this meeting, 122 new members being enrolled.

In the reports of the officers and in the discussions on the floor the need for some restrictive legislation to check the growing evil of the itinerant pedler of medicines was impressed upon the members. The association will renew its efforts of last year to secure such legislation. The conditions will be explained to the public and petitions to the legislature sent out for signatures.

E. G. Eberle, of Dallas, addressed the meeting on the subject of pharmacal testing, giving a number of practical demonstrations. Profs. R. R. D. Cline, of the State University, and C. S. N. Hallberg, of Chicago, discussed this topic.

Prof. Hallberg spoke of the desirability of co-operation between pharmacists and physicians in eliminating secret medicaments. Prof. Hallberg was made an honorary member of the association.

The report of R. H. Walker, of Gonzales, as secretary of the board of pharmacy, was received with great approval.

The governor will appoint a new board of pharmacy this year, and for his consideration in selecting the members of the board, the association nominated Bruce Vredenburg, of Beaumont; J. T. Coulson, of Corsicana; R. B. Richter, of New Braunfels; W. H. Cousins, of Munday; R. S. Duner, of Elgin; Paul Breyman, of Schulenberg; B. B. Treadwell, of Uvalde; J. A. Weeks, of Ballinger; T. J. Snell, of Cooper; and W. F. Robertson, of Gonzales.

For the entertainment of the visitors San Antonio drugdom had extended itself lavishly. There were trolley

rides, parkings, musical and vaudeville entertainments and a barbecue.

The following officers were elected: President, R. H. Walker, of Gonzales; vice-presidents, H. C. Jackson, of Austin; F. A. Chapa, of San Antonio; and H. V. Schumann, of New Braunfels; secretary and treasurer, E. G. Eberle, of Dallas; home secretary, H. L. Carleton, of Austin; local secretary, J. W. Covert, of Fort Worth; historian, Miss C. A. Shipe, of Austin; and trustee, W. H. Cousins, of Munday.

Fort Worth will be the meeting place next year.

Vermont Association.

The members of the Vermont Pharmaceutical Association were so pleased with their stay at Lake Bomoseen, June 22d to 24th, that it was unanimously decided to meet there again next year.

Much thought and a wide acquaintance with pharmaceutical matters of import were evident in the annual address of President W. R. Warner, of Vergennes. He urged the development of the commercial side of pharmacy as a means of combatting the inroads of mail-order houses and peddlers. Commercialism and professional pharmacy are possible allies in his opinion. Counter-prescribing he condemned roundly. Legislation received particular attention, and he lauded the work of the 1908 legislative committee, and urged the druggist to take a more active interest in politics.

Dr. J. A. Mead, the lieutenant-governor of the State, spoke of the need of co-operation between pharmacists and physicians. The Doctor was elected to honorary membership in the association. So, too, was Dr. W. D. Grace, of Portsmouth, N. H.

The membership of the association, as reported by Secretary W. E. Terrill, of Montpelier, was 323. Thirty-five new members were enrolled during the meeting.

Treasurer J. M. Taylor, of Bradford, reported a balance on hand of \$33.48.

Three papers on "Propaganda Work" were read; the authors were Dr. Tobin, of Bristol; A. L. Cheney, of Morrisville; and L. J. Trudel, of Rutland. F. J. Kline, of Bartons Landing, read a very able paper on "Should Druggists Handle Liquor when They Have the Legal Right? How It Affects Business."

There was a very intense discussion of a suggestion made by President Warner to the effect that an effort should be made to secure for the association some voice in the selection of the men to be appointed by the governor to the board of pharmacy. The matter was finally left to the legislative committee.

The entertainment features of the meeting were most enjoyable.

The new officers are: President, A. L. Cheney, of Morrisville; vice-presidents, J. G. Bellrose, of Burlington; G. C. Smith, of South Londonderry; and Elizabeth Gregg, of Bennington; secretary, W. E. Terrill, of Montpelier; and treasurer, J. M. Taylor, of Bradford.

Virginia Association.

This year the Virginians stayed at home, the twenty-eighth annual meeting of the Virginia Pharmaceutical Association being held at the scenic Natural Bridge, July 6th to 8th. The attendance was the largest in the history of the organization.

Secretary C. B. Fleet, of Lynchburg, reported a membership of 218. Thirty-odd druggists were elected to membership at the meeting.

The report of Treasurer H. S. Eley, of Suffolk, showed the association to be in a gratifying state financially.

Much of the discussion at the sessions was devoted to the question of liquor-selling by druggists, and the sale of narcotics. A firm stand against the sale of alcoholics was taken, and the enactment of a law placing close restrictions upon it will be striven for. It was the consensus of opinion that the sale of narcotics is decreasing.

Appropriate resolutions were adopted in memory of the late G. J. Seabury, of New York, an honorary member, and W. H. Scott, of Richmond.

The following papers were read: "Gravel and Grit," by A. H. Robins; and "Business in Reagents and Bacterial Stains," by Gordon Blair.

J. E. Jackson, J. L. Hagan, J. P. Jones, W. H. Sheppe and G. A. Van Lear were selected for recommendation to the governor for his consideration in naming a member of the board of pharmacy.

On the pleasurable side of the meeting were a variety

of athletic contests, and an entertainment by the indispensable Polk Miller.

Officers were elected as follows: President, G. A. Van Lear, of Roanoke; vice-presidents, H. R. McKay, of Luray; and W. L. Lyle, of Bedford City; secretary, C. B. Fleet, of Lynchburg; treasurer, H. S. Eley, of Suffolk; executive committee, H. C. Barnes, of Roanoke; W. M. Stokes, of Lynchburg; and H. C. Littlejohn, of Leesburg.

Wisconsin Association.

The twenty-ninth annual meeting of the Wisconsin Pharmaceutical Association was held at Elkhart Lake, June 22d to 24th.

The annual address of President W. W. Albers, of Wausau, contained a very urgent appeal to the druggists of the State to enroll in the association so as to give it a better standing before the State legislature. Better support was asked for the propagandic work of the association and the members were advised to grasp the opportunity offered by this work for assisting the physician. The president favored redoubled efforts to secure the enactment of a law imposing a tax on traveling medicine peddlers. He also was in favor of the appointment of a pharmacist on the board of regents of the University of Wisconsin. It was his belief that the school of pharmacy should receive more attention from the association and druggists in general. He did not favor the free distribution of antitoxic serums by the board of health.

Two hundred and seventy-seven was the number of members reported by Secretary E. B. Heimstreet, of Janesville. To this were added about sixty secured at the meeting.

A balance of \$221.35 was reported in the hands of Treasurer W. P. Clarke, of Milton.

Interesting reports were made by the propaganda committee, the legislative committee, and various delegates. The sessions were enlivened by several good discussions.

The entertainment features were particularly pleasing, being largely under the auspices of the travelers' auxiliary. This organization published accounts of the sessions and numerous personals in a daily paper the *Daily Pill*.

The officers elected for the ensuing year are: President, F. M. Charlesworth, of Kaukauna; vice-presidents, O. P. Erhart, of La Crosse; and M. C. Trayser, of New London; secretary, E. B. Heimstreet, of Janesville; treasurer, W. P. Clarke, of Milton; and local secretary, W. H. Barr, of Milwaukee.

Virginia Association of Graduate Pharmacists.

A new pharmaceutical organization with the stated purpose of elevating the educational qualifications of the pharmacists of the State was recently organized at Richmond, Va. The new organization has taken the name the Virginia Association of Graduate Pharmacists. Membership is limited to the graduates of reputable colleges of pharmacy, no other requirements being necessary.

The present officers are: President, H. G. Whitehead; vice-president, A. E. Dorsey; secretary, W. F. Rudd; treasurer, Maude Lambert; executive committee, N. T. Ennett, Rea Parker, and W. F. Rudd.

An exciting incident of the 1909 meeting of the Maryland Pharmaceutical Association at Ocean City was the narrow escape from drowning of Prof. Daniel Base, of the Department of Pharmacy, University of Maryland. Prof. Base had ventured in too far and was being carried out by the strong undertow, when J. E. Hengst and H. A. B. Dunning went to his rescue, and brought him ashore, not without considerable trouble.

An active campaign to secure new members is being carried on by the Philadelphia Drug Club, the proper maintenance of the organization necessitating a large membership. Two special committees on membership have been appointed. One will canvass the retail trade, and the other will call upon the wholesalers and endeavor to interest them in the benefits of the club.

The firm of Connolly & Davis, of Dorchester, Mass., was dissolved June 14th. F. W. Connolly will operate the store at Field's Corner; and C. H. Davis is now the proprietor of the store at 760 Washington street, and the one at Neponset.

The Georgia Board of Pharmacy and the Savannah Retail Druggists' Association are co-operating with the State chemist and the commissioner of agriculture to secure the enactment of a law that will restrict the sale of phenol.

News of the Pharmacy Boards.

List of Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting are known they are given also. Secretaries are requested to keep us informed as to dates and places.

- ALABAMA—E. P. Galt, Selma.
 ARIZONA—November 10th, at Phoenix. A. G. Hulett, Phoenix.
 ARKANSAS—J. F. Dowdy, Little Rock.
 CALIFORNIA—Louis Zeh, San Francisco.
 COLORADO—S. L. Bresler, Denver.
 CONNECTICUT—September 7th, at Hartford. J. A. Levery, Bridgeport.
 DELAWARE—O. C. Draper, Wilmington.
 DISTRICT OF COLUMBIA—October 14th and 15th, at Washington. S. L. Hilton, Washington.
 FLORIDA—D. W. Ramsaur, Palatka.
 GEORGIA—C. D. Jordan, Monticello.
 IDAHO—T. M. Starrh, Shoshone.
 ILLINOIS—F. C. Dodds, Springfield.
 INDIANA—October 12th and 13th, at Indianapolis. A. F. Heineman, Valparaiso.
 IOWA—August 3d, at Des Moines. C. W. Larson, Des Moines.
 KANSAS—August 25th, at Ellsworth. W. E. Sherriff, Ellsworth.
 KENTUCKY—J. W. Gayle, Frankfort.
 LOUISIANA—August 6th and 7th, at New Orleans. Fred Earhart, New Orleans.
 MAINE—F. A. Wilson, Brunswick.
 MARYLAND—December 28th and 29th, at Baltimore. Ephraim Bacon, Baltimore.
 MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. C. F. Ripley, Boston.
 MICHIGAN—August 17th to 19th, at Sault Ste. Marie. J. D. Muir, Grand Rapids.
 MINNESOTA—October 18th, at Minneapolis. C. T. Heller, Minneapolis.
 MISSISSIPPI—October 5th, at Jackson. L. H. Wilkinson, Indianola.
 MISSOURI—October 11th, at St. Louis. Charles Gietner, St. Louis.
 MONTANA—October, —, at Helena. S. J. Coffee, Missoula.
 NEBRASKA—C. R. Sherman, Omaha.
 NEW HAMPSHIRE—F. H. Wingate, Nashua.
 NEW JERSEY—October 21st and 22d, at Trenton. H. A. Jorden, Bridgeton.
 NEW MEXICO—A. J. Fischer, Santa Fe.
 NEVADA—R. L. Prouty, Tonopah.
 NEW YORK—Eastern Branch—September 15th and 16th, at Brooklyn. Joseph Weinstein, 115 West Sixty-eighth street, New York. Middle Branch—September 15th and 16th, at Albany. W. L. Bradt, Albany. Western Branch—September 15th and 16th, at Buffalo. George Reimann, Buffalo.
 NORTH CAROLINA—November 23d, at Raleigh. F. W. Hancock, Oxford.
 NORTH DAKOTA—October 18th, at Fargo. W. S. Parker, Lisbon.
 OHIO—October 12th and 13th, at Columbus. F. H. Frost, Columbus.
 OKLAHOMA—J. C. Burton, Stroud.
 OREGON—September 6th and 7th, at Portland. C. G. Huntley, Oregon City.
 PENNSYLVANIA—August 18th and 19th, at Williamsport. C. T. George, Harrisburg.
 RHODE ISLAND—October 5th, at Providence. J. E. Brennan, Pawtucket.
 SOUTH CAROLINA—F. M. Smith, Charleston.
 SOUTH DAKOTA—E. C. Bent, Dell Rapids.
 TENNESSEE—I. B. Clark, Nashville.
 TEXAS—September 21st, at Dallas. R. H. Walker, Gonzales.
 UTAH—W. H. Dayton, Salt Lake.
 VERMONT—D. F. Davis, Barre.
 VIRGINIA—October 26th, at Richmond. T. A. Miller, Richmond.
 WASHINGTON—P. Jensen, Tacoma.
 WEST VIRGINIA—October —, at Bluefield. A. Walker, Sutton.
 WISCONSIN—H. G. Ruenzel, Milwaukee.
 WYOMING—C. B. Gunnell, Evanston.

District of Columbia Board.

At the meeting of the District of Columbia Board of Pharmacy held July 8th and 9th, sixteen applicants for registration were examined. The following five passed:

W. C. Bateman, G. B. Bury, F. P. Carr, S. J. B. Collins and J. F. Emmons.

The next meeting of the board will be held October 14th and 15th.

Iowa Board.

Out of sixty-eight applicants for registration examined by the Iowa Board of Pharmacy at the meeting held June 1st, twenty-two were successful.

The next meeting of the board will be held August 3d, at Des Moines.

Maryland Board.

Forty-three applicants for registration were passed by the Maryland Board of Pharmacy at the meeting held June 3d and 4th, at Baltimore. Their names follow:

As pharmacists—Abraham Abelsky, Ada C. Albert, J. H. Allan, H. S. Bramber, D. W. Brown, O. B. Farow, J. L. Fitzgerald, W. F. Gakenheimer, E. M. Garrott, M. J. Goude-lock, B. A. Greene, W. W. Hall, H. C. Ivins, W. B. Jones, L. M. Kantner, George Kenyon, E. C. Kehr, Edith A. Kramer, R. H. Lehr, G. F. McKenzie, J. S. Sandler, G. J. Schneider, H. W. Smith, G. A. Stall, Michael Stefanski, E. B. Stolberg, W. W. Vogel, H. E. Wich, L. S. Williams, E. F. Winslow, H. E. Young and C. L. Ziegler.

As assistants—G. E. Bowman, W. M. Bray, Walter Brenton, W. F. Greene, J. F. Holden, O. L. Johnson, Daird Kirchner, W. R. Kolb, C. H. W. Oertel, J. L. S. Quinn and J. L. Renchan.

The next meeting of the board will be held at Baltimore, December 28th and 29th.

J. A. Davis, of Baltimore, will represent the board at the 1909 meeting of the National Association of Boards of Pharmacy.

Massachusetts Board.

Examinations were held by the Massachusetts Board of Pharmacy, June 7th, 8th, 14th, 15th, 21st, 29th and 30th, a total of 127 applicants being examined. Thirty-two were passed as pharmacists, and forty-nine as assistants. They are:

As pharmacists—Sister M. Alice, J. D. Crowley, Katherine M. Cullinen, E. A. Doyle, J. P. McHugh, J. F. Smith and A. P. Wood, all of Boston; T. L. Aiken, of Watertown; J. L. Aillery, of New Bedford; G. T. Bates, of Lynn; J. A. Burke, of Milford; W. E. Cunningham, of Lowell; P. L. Fox, of Holyoke; D. J. Gleason, of Worcester; A. E. Hemenway, of Medfield; H. L. Hussey, of Dover, N. H.; Vernon Laing, of Cambridge; F. A. Lavelle, of Somerville; H. A. Lewis, of Greenfield; R. E. Lyons, of Haverhill; J. J. McDonnell, of Westfield; F. G. Minter, of Medford; J. G. Molineaux, of North Cambridge; F. A. O'Reilly, of Lawrence; F. T. Quinn, of Lowell; E. L. Sargent, of Lakeport, N. H.; Jennie H. Sargent, of Everett; J. J. Sullivan, of Fitchburg; C. H. Upton, of Salem; G. A. Ware, of Malden; E. E. Wilkins, of Pittsfield; and W. E. Young, of Taunton.

As assistants—J. H. Ahern, Maurice Brody, C. M. Couyle, J. H. Dorsey, J. A. Flynn, Harry Ginsburg, Boris Goldberg, Sister M. Leonarda, F. D. B. Mitchell, A. J. O'Brien and R. B. Roger, all of Boston; G. A. Beane, of Lynn; H. B. Blanchard, of Somerville; Neil Blank, of Springfield; G. J. Boucher, of Fall River; B. M. Burke, of Newton; W. B. Burke, of Lowell; A. W. Carroll, of Winchendon; F. B. Chase, of Wollaston; J. F. Clerke, of Lawrence; W. G. Collagan, of West Newton; L. E. Comeau, of Gloucester; T. M. Conlon, of Leominster; F. C. Curley, of Holyoke; F. S. Delay, of Rockland; Robert Donnellan, of Lowell; G. H. Du Paw, of Malden; R. H. Estabrook, of Fitchburg; E. A. Ferguson, of Danvers; U. E. Fortier, of Springfield; C. W. Freeman, of Somerville; A. F. French, of Peabody; John Hansen, of Everett; G. M. Harris, of Arlington; W. A. Haslam, of Everett; F. H. Healey, of Clinton; John Hillery, of Somerville; A. B. Johnson, of Natick; E. T. Lee, of Beverly; Charles Leibel, of Malden; A. L. McGilvray, of Quincy; Saul Michelson, of Chelsea; P. P. Mitchell, of Marlboro; W. J. Murray, of Natick; H. W. Perry and H. I. Quennell, both of Somerville; Luigi Scelfo, of New-ark, N. J.; and G. E. Wildes, of Beverly.

The weekly meetings of the board, which have been discontinued during the summer, will be resumed September 7th.

Michigan Board.

Seventy-seven persons asking registration as pharmacists, and thirty-one, as druggists were examined by the Michigan Board of Pharmacy at the meeting held June 14th to 17th, at Star Island. Seventeen and seven, respectively, were successful; these are:

As pharmacists—J. M. Breyer, R. H. Curtiss, Joseph Durand, H. L. Guffin, W. A. Kaminski, C. M. Moncur, F. W. Werth and C. L. Williams, all of Detroit; A. V. Axelsson, of Hancock; O. H. Bauch, of Lansing; Benjamin Burkhead, of Traverse City; C. G. Cramer, of Saginaw; T. F. Cronkite, of Breckenridge; C. E. Curley, of Bay City; B. F. Hartford, of Marion; Clinton Horn, of Grawn; and C. J. Renkes, of Battle Creek.

As druggists—G. F. Gratton, H. E. Mudge and H. Van Norman, all of Detroit; J. R. Burt, of Ada; F. Goetz, of Forestville; R. Hams, of Grand Rapids; and W. J. Moore, of Port Huron.

The next meeting of the board will be held at Sault Ste. Marie, August 17th to 19th.

Missouri Board.

The Missouri Board of Pharmacy held a meeting at Joplin, June 14th, examining eighty-six applicants for registration. The following, forty-two in number, were successful:

Amos Alsobrock, of St. Louis; R. M. Baugham, of Warsaw; J. J. Bradley, of Higbee; C. S. Bradbury, of Joplin; F. H. Burk, of Sedalia; T. S. Combs, of Greenfield; A. H. Cox, of Monett; C. H. Craig, of Galena; A. A. Eberlein, of St. Louis; F. C. Evans, of Kansas City; H. W. Freeman, of Columbia; W. H. Gunther, of Carthage; E. L. Hagler, of Monett; N. H. Horn, of Joplin; Ada Hoover, of Kansas City; P. W. Hummee, of New Madrid; George Hunt, of Richmond; G. W. McClure, of Cassville; Everett McCool, of Joplin; E. G. McCrackin, of Webster Grove; Glenn McMichael, of Des Moines, Ia.; R. C. Mershon, of Kansas City; Edward Masplay, of Granby; D. E. Miller, of Monett; F. M. Miller, of Des Moines, Ia.; O. G. Moline, of Kansas City; T. H. Moore, of Nevada; Richard Morgan, of Fair Play; W. D. O'Neal, of Albany; J. K. Patterson, of St. Louis; J. L. Rosse, of Fayette; A. R. Sasse and M. S. Sattle, both of Kansas City; K. W. Smith, of Carthage; F. P. Soldan, of Macon; H. S. Stander, of St. Louis; C. G. Steinwell, of Richmond; Roy Sullens, of Webb City; W. E. Swan, of Troy; H. A. Walker, of Seligman; and J. J. Yates, of Webb City.

The next meeting of the board will be held October 11th, at St. Louis.

New York Board.

An examination was held by the Eastern branch of the New York Board of Pharmacy at this city, June 16th and 17th, at which twenty-three persons made application for registration. The following were successful:

L. R. Adams, Samuel Adler, C. W. Ballard, Leonard Di Nolfo, W. W. Geety, N. Y. Hull, T. A. Jost, Joseph Kaminsky, John Kindergarten, Charles Lutz, Philip Ohly, Charles Parker, Moses Sobel, E. F. Thode, P. H. Wagner and Cornelius Zeisler.

W. L. Bradt, of Albany, the general secretary of the board, was re-elected a member of the middle branch at the election held at Richfield Springs during the annual meeting of the New York Pharmaceutical Association.

L. W. Miller, of Niagara Falls, has been elected a member of the western branch to succeed H. M. Groves, of Batavia, whose term of office expires this year.

North Carolina Board.

At the meeting of the North Carolina Board of Pharmacy held June 21st, at Greensboro, the following applicants for registration passed the examination:

J. W. Biggs, of Williamston; S. O. Brown, of Raleigh; Roy Champion, of Greensboro; J. L. Cherry, of Raleigh; Myrtle H. Cox, of Wadesboro; B. T. Dawson, of Tarboro; C. W. Eason, of Statesville; D. A. Elvington, of Wilmington; S. B. Etheridge, of Edenton; R. C. Faulcener, of Greensboro; H. A. Griffin, of Rocky Mount; D. H. Hage, of Asheville; T. N. Harrison, of Littleton; A. A. James, of Winston-Salem; G. T. Jones, of Elizabeth City; J. R. Kelly, of Monroe; James Kerr, of Wilmington; D. C. Lisk, of Hamlet; J. U. Loftin, of Troy; C. A. Lord, of Wilmington; T. C. McIlhenny, of Greensboro; J. H. McLelland, of Mooresville; C. L. Mallette, of Rocky Mount; Norman Morrow, of Gastonia; S. P. Pemberton, of Troy; Clifford

Porter, of Concord; W. D. Preston, of Mt. Airy; R. C. Robertson, of Clayton; F. M. Salley, of Asheville; F. A. Sloan, of Monroe; J. F. Wagner, of Thomasville; Clara W. Whitehead, of Salisbury; and S. O. Yates, of Morrisville.

The next meeting of the board will be held November 23d, at Raleigh.

North Dakota Board.

Of the forty-two applicants for registration examined by the North Dakota Board of Pharmacy at the meeting held June 15th and 16th, at Fargo, nine were successful as pharmacists, and nine, as assistants. Those who passed are:

As pharmacists—A. S. Boyer, of Ready; C. E. Fleck, of Casselton; A. E. Foss, of Hatton; H. C. Hallderssen, of Park River; H. L. Hill, of Fargo; W. H. Humphrey, of Moorhead; O. F. Rose, of Grand Forks; Samuel Russell, of Thompson; and Otto Stensrud, of Beach.

As assistants—R. J. Beckwar, of Berthold; James Bennett, of Sanborn; C. A. Hagburg, of Dassel; W. J. Keefe, of Hettinger; W. A. Knoop, of Fargo; L. L. Larson, of Webster, S. D.; D. B. McDonald, of Edgemore; Albert Morin, of Walhalla; and R. A. Stieff, of Velva.

The next meeting of the board will be held at Fargo, October 18th.

Oregon Board.

There were fifty-four persons examined by the Oregon Board of Pharmacy at the meeting held June 8th and 9th, at Portland. The following passed:

As pharmacists—C. M. Brink, C. R. Chase, H. L. Christenson, R. H. Cody, E. H. Hatch, P. C. Rinehart, F. P. Schreiber and G. D. Stewart, all of Portland; E. E. Applewhite, of Roseburg; C. E. Barben, of Baker City; J. S. Chybke, of Sellwood; D. C. Cowles, of Woodburn; E. W. Hodson, of Newberg; M. H. Horton and J. W. Howard, both of Corvallis; T. R. Parsons, of Yarnhill; C. C. Peery, of Falls City; R. V. Pointexter, of Prineville; E. F. Surface and Pearl I. Williams, both of Corvallis; and F. J. Wilson, of Canyonville.

As assistants—B. R. Brook, Ralph Delano and F. A. Viles, all of Portland; and H. L. Stonaker, of Grants Pass.

The next meeting of the board will be held September 6th and 7th, at Portland.

Pennsylvania Board.

Examinations were conducted by the Pennsylvania Board of Pharmacy May 21st and 22d, at Philadelphia and Pittsburg. At the former place 157 applicants for registration as pharmacists, and 146 for registration as assistants were examined; at Pittsburg 73 applied for registration as pharmacists, and 70 as assistants. In all, 139 were successful as pharmacists, and 155 as assistants. Those who passed are:

As pharmacists—J. H. Allen, T. P. Babbitt, H. H. Bell, Mitchell Bernstein, Z. E. Bohn, J. T. W. Bonner, M. A. Bossert, E. G. Brown, H. H. Brown, M. R. Cady, H. M. Cameron, Philip Canlon, J. M. Casey, J. A. Clewell, Daniel Cubiciotti, R. W. Cuthbert, Jacob Davidovitch, Chester Evans, W. T. Evans, J. T. Fischer, Bernard Fishman, J. R. Fulton, C. B. Gallant, E. H. Gerdis, J. C. Gibbs, H. L. Goldberg, S. J. Goldberg, H. M. Greim, B. C. Haines, C. G. Hersh, C. E. Hoffmann, Amos Jones, A. C. Keim, F. C. Kinney, J. B. Leedy, N. M. Levey, J. A. Logan, J. L. McMahon, John Moser, E. C. Murray, E. A. Noedel, F. A. Pfeifer, W. H. Pond, M. B. Schwartz, O. E. Segge, F. L. Selb, J. S. Simpers, B. S. Sprissler, Mabel Starr, Benjamin Steimer, H. E. Strauss, G. S. Tregella and Sara C. White, all of Philadelphia; A. W. Aiken, H. G. Blank, O. C. Boerner, F. P. Carter, J. D. Crampton, Louis Emanuel, Jr., C. J. Grove, E. F. Heinrick, Leon Horwitz, Ralph Lipton, C. L. Payne, R. L. Peel, P. T. Squitieri, G. O. Stech and E. A. Swartz, all of Pittsburg; A. E. Albert of Mount Pleasant; H. J. Alexander, of Crafton; C. L. Anderson, of New York, N. Y.; E. A. Ashton, of Wilkes-Barre; Earl Bailey, of Waynesburg; R. F. Campbell, of Donora; W. F. Cramer, of Point Pleasant, N. J.; R. J. Crowthers, of Monessen; G. A. Dapp, of Harrisburg; H. C. Davis, of Christiana; P. M. Davis, of Scranton; J. C. Dreibelbis, of Wisconsin; G. S. Dunbar, of Asbury Park, N. J.; H. W. Eakle, of Hagerstown, Md.; G. P. Fehrman, of Sharpsburg; W. E. Ferron, of Salt Lake City, Utah; G. C. Garber, of Washington; J. F. Grabowski, of McKeesport; E. A. Grodicour, of Monongahela; L. R. Hayne, of Masontown; D. E. Haller,

of Chambersburg; G. C. Harvey, of Lock Haven; C. S. Herron, of Dubois; D. L. Houck, of Indiana; W. S. Howard, of New Kingston; F. E. Hulme, of New Castle; R. T. Hunter, of Altoona; Albert Hutson, of Camden, N. J.; T. F. Jackson, of Braddock; C. A. Jones, of Bradford; F. J. Keim, of Dubois; E. L. Kelley, of Elmira, N. Y.; Solomon Kleckner, of Girardville; W. R. Klopp, of Womelsdorf; H. M. Knight, of Quarryville; H. J. Krum, of Allentown; A. W. Levan, of Coatesville; G. M. Levan, of Esterly; L. J. Lindsley, of Corry; S. W. Livengood, of Munhall; H. C. McClellan, of Wilkinsburg; F. H. Miller, of Beaver Falls; R. J. Moeschlin, of Sunbury; R. A. Mooney, of Worcester, Mass.; W. H. Obergh, of Titusville; R. C. Osterwise, of Greensburg; C. E. Paisley, of New Castle; J. B. Parks, of Leechburg; H. W. Pegg, of Millville; A. A. Platt, of Morristown; H. E. Pontius, of Chicora; E. W. Pyfer, of Avalon; E. G. Reig, of Warren; E. M. Rentschler, of Reading; C. E. Schlenker, of Wapakoneta, O.; R. W. Schoonover, of Bellevue; J. W. Smith, of Bradford; G. F. Steinmach, of Millville; E. C. H. Stinle, of Scranton; C. E. Stump, of Wilkinsburg; F. G. Thompson, of Conneautville; R. A. Timms, of West Newton; W. E. Vance, of Wampum; Charles Weyels, of Braddock; F. B. Wick, of West Sunbury; R. B. Wissler, of Lancaster; D. O. Wolf, of Boston, Mass.; G. B. Wood, of Bradford; R. J. Wotring, of Allentown; W. A. Yeakel, of Morristown; and H. E. Young, of Hagerstown, Md.

As assistants—N. H. Anthony, Samuel Baradofsky, Samuel Baron, Max Baum, W. D. Baun, Chester Bollinger, Rosa K. Brister, R. E. Buins, Lloyd Burt, A. C. Butler, Gerson Cournos, Samuel Crissman, W. T. de la Reintrie, H. A. Erney, J. S. Fanz, Harry Farber, W. J. Ferrell, Lewis Fleisher, Louis Freedman, N. M. Friedman, W. J. Gaskell, S. P. Glass, Meyer Goldberg, S. E. Gosnay, F. H. Grazer, Charles Gutzert, Morris Haimowitz, A. S. Hall, Philip Hanopolsky, J. L. Harrison, W. M. Hart, Elmer Hessler, Elias Israelvitz, Nathan Kaufman, S. B. Kennedy, C. B. Klapp, James Kramer, J. A. Laferty, D. J. Lawsons, A. F. Lippi, H. M. Medd, M. L. Messinger, J. J. Misorocho, Mary E. Morgan, E. F. L. Moyer, L. H. Myers, Rae V. Nicholas, W. T. Plowman, W. L. Pratt, Harry Promisloff, Albert Rachmil, Chester Riland, L. A. Rominecki, G. H. Scholl, Israel Spiers, Morris Stein, L. S. Templeton, S. P. Verstine, Louis Viner, Harry Wagner, A. N. Wilcox and D. S. Zelmanoff, all of Philadelphia; H. A. Bearl, L. B. Boreman, W. D. Callahan, G. N. Coleman, J. M. Geier, Wladyslaw Laweck, W. J. Ochsenhirt, Leon Pinecki, F. L. Schweitzer, J. D. Sullivan, George Weger and P. E. Yeager, all of Pittsburg; H. E. Allen, of Parnassus; J. W. Atkins, of Lebanon; R. A. Bell, of Chicora; Anna E. Bigard, of Carbondale; W. L. Bischoff, of Haddonfield, N. J.; J. V. Blair, of Clarendon; A. P. Blayney, of Homestead; W. H. Bronner, of East Stroudsburg; C. E. Burley, of Harrisburg; J. W. Carroll, of Charleroi; J. J. Casey, of West Pittston; A. W. Chapin, of Kingston; C. W. Christenson, of Kane; T. G. Conander, of McKeesport; B. B. Cook, of Hazleton; R. W. Crawford, of Dubois; R. M. Davis, of Johnstown; H. V. Day, of Glassport; R. E. Dersch, of Reading; L. W. Detweiler, of Jeanette; H. B. Dilatush, of Hightstown, N. J.; W. T. Fair, of Dubois; C. E. Gault, of Findley, O.; H. A. Gibson, of Washington; C. M. Goodhart, of Reading; O. A. Griffin, of Spadva, Ark.; R. H. Heiser, of Washington; George Helwig, of Ashland; C. P. Hildebrand, of Morgantown, N. C.; Lester Hollander, of Braddock; D. W. Huber, of Gettysburg; William Jacobs, of Morristown; G. E. Kahl, of Manheim; R. A. Keltz, of Parnassus; R. L. Krall, of Harrisburg; O. P. Kreamer, of Mill Hall; C. C. Kuenzig, of Carnegie; Harry La Don Blou, of Beverly, N. J.; T. W. Lawrence, of Emlenton; A. M. Lewis, of Plymouth; C. J. W. Lyons, of Wilkes-Barre; E. R. McAbee, of Oil City; H. I. McCormack, of Scranton; H. A. McGlumphy, of Braddock; C. R. Maldoon, of Donora; J. A. H. Martin, of Emsworth; John Miles, of Mahanoy City; W. J. Morgan, of Peckville; W. J. Murphy, of Scranton; Anastasius Parobeck, of Johnstown; J. F. Peebles, of Greensburg; Emil Pekarek, of Wilkes-Barre; H. J. Pettyjohn, of Milford; J. W. L. Purcell, of Shenandoah; B. C. Rhoads, of Shamokin; L. J. Roe, of Oil City; W. W. Rose, of Georgetown, Del.; Minnie Rothwell, of Hatboro; Israel Rovner, of Carmel; F. W. Shell, of New Cumberland; H. E. Schellenger, of Cape May; N. J.; C. A. Schrank, of West Pittston; E. H. Shaffer, of Elizabeth; Elias Shaker, of Poughkeepsie, N. Y.; James Sheffer, of Greensburg; G. F. Shugars, of Shippensburg; W. V. Stafford, of Freehold, N. J.; W. E. Strunk, of Lock Haven; W. G. Sylvester, of Bridesburg; Frank Taylor, of Cannons-

burg; C. R. Wambaugh, of Wilkesburg; S. R. Washko, of Windber; A. M. Weimer, of Scranton; W. E. Welch, of Crafton; A. G. Wepfer, of Neillsville, Wis.; E. H. Willets, of New Kensington; F. J. Williams, of Plymouth; L. H. Williams, of Olyphant; L. R. Williams, of Plymouth; and C. H. Woodford, of Allegheny.

The next meeting of the board will be held August 18th and 19th, at Williamsport.

West Virginia Board.

At the meeting of the West Virginia Board of Pharmacy, held June 1st, at Morgantown, thirty-six persons made application for registration as pharmacists, and eight as assistants. Twenty and seven, respectively, were successful, being the following:

As pharmacists—S. D. Ault, of Charleston; D. G. Baxter, of Wilson, Pa.; T. H. Becker, of Bluefield; S. C. Blair, of St. Albans; J. D. Dent, of Charleston; L. D. Emery, of Sistersville; W. M. Greenwood, of Bluefield; J. R. Judy, of Petersburg; J. G. Keyyl, of Bluefield; E. P. Kochert, of Wheeling; J. A. Lendon, of Pocahontas, Va.; O. H. Levier, of Weston; Sister Mary B. McCarrell, of Wheeling; W. E. McCoy, of Buffalo; C. E. Paisley and J. M. Rice, both of New Castle, Pa.; Earl Richards, of Parkersburg; D. C. Sturgiss, of Fairview; B. C. Windom, of Buckhannon; and L. A. Yancey, of Kimball.

As assistants—L. T. Ford, of Roseville; H. L. Gum, of Gassaway; E. W. Jones, of Huntington; D. B. Myers and J. DeW. Thompson, both of Morgantown; H. P. West, of Sistersville; and J. W. Wilson, of Lewisburg.

The next meeting will be held at Bluefield some time in October.

The board elected the following officers for the ensuing year: President, F. B. Haymaker, of Clarksburg; and secretary, Alfred Walker, of Sutton.

S. M. Scott, of Terra Alta, has been re-appointed a member of the board.

Wisconsin Board.

O. J. S. Boberg, of Eau Claire, whose term as a member of the Wisconsin Board of Pharmacy expired this year, has been re-appointed for a period of five years.

Pharmacists in the Government Service.

The following official announcements have been made:

PUBLIC HEALTH AND MARINE-HOSPITAL SERVICE.

Pharmacist L. W. Ryder received a grant of one day's leave of absence, June 19th.

Pharmacist J. M. Bell: Leave of absence granted May 27th, for thirty days from June 18th, amended to read thirty days from July 10th.

Pharmacist K. H. Graham received a grant of fifteen days' leave of absence from July 1st.

Pharmacist K. H. Graham resigned to take effect July 15th.

Pharmacist W. L. Stearns was reassigned for duty at Pensacola, Fla., to date from May 25th, last.

Pharmacist F. L. Brown was relieved from duty at Boston, Mass., and directed to proceed to the South Atlantic quarantine station.

Pharmacist Malcolm McKay was relieved from duty at the Gulf quarantine station and directed to proceed to Key West, Fla.

Pharmacist B. E. Holsendorf was reassigned for duty at San Juan, P. R., to date from February 12th, 1908.

Pharmacist L. W. Ryder received a grant of two days' leave of absence from June 25th.

Pharmacist M. R. Mason was reassigned for duty at San Francisco quarantine station, to date from February 12th, 1908.

Pharmacist R. F. Troxler: Leave of absence granted May 28th for twelve days from June 7th, amended to read ten days from June 7th.

Pharmacist G. A. Morris was reassigned for duty at St. Louis, Mo., to date from February 4th, last.

Pharmacist C. Stier was relieved from duty at Key West, Fla., and directed to proceed to the Gulf quarantine station.

Pharmacist J. M. Bell was reassigned for duty at Fort Stanton, N. M., to date from February 4th, last.

Pharmacist E. B. Scott was promoted to be a pharmacist of the first class, to date from June 19th.

Pharmacist L. C. Spangler received a grant of twenty-four days' leave of absence from July 1st.

Obituaries.

JOHN BERRY, retired, died at Saco, Me., June 3d.

Brigadier-General BOBELETER, mayor of New Ulm, Minn., died recently after a long illness.

BERT BREITHAUP, of Fairbury, Ill., was drowned recently in the Illinois River.

Dr. C. J. L. CARBERRY, formerly of Philadelphia, Pa., is dead at Atlantic City, N. J. He was sixty years old.

CHARLES E. CLEMSON died at Reading, Pa., June 24th.

Dr. ISAAC S. CURTIS, aged seventy years, died recently at Brunswick, Me.

E. B. DOLL is dead at Greencastle, Ind.

JESSE J. DRIVER, of Ogden, Utah, died recently, at the age of sixty-eight years.

PETER GISHER, a native of Russia, died recently, at Milwaukee, Wis.

JOHN J. GOODLAD died at Jersey City, N. J., June 15th, aged fifty-seven years.

ARTHUR B. GREENWOOD, forty-nine years old, is dead at Brockton, Mass.

NOAH SPARHAWK HARLOW, librarian of the Bangor Historical Society, died recently at Bangor, Me. He was eighty years old.

W. P. HARRISON, president of the Fariss-Klutznick Drug Company, of Greensboro, N. C., is dead, at the age of thirty-three years.

NEWTON G. HILDRETH, of Cincinnati, O., died in June. He leaves a widow and six children.

EDWARD CLARENCE HOPKINS, one-time member of the firm of H. Bosworth & Co., of Milwaukee, Wis., died recently at Lockport, N. Y. He was seventy-two years old.

JOSEPH KINSEY died recently at Cleveland, O., at the age of thirty-three years.

THOMAS PENFIELD LITTLEBRANDT died June 22d, at Orange, N. J. He was sixty-two years old.

CHARLES L. LOCKWOOD, former supervisor of the St. Lawrence, New York State, hospital for the insane, is dead at Revere, Mass, aged sixty-eight years.

J. K. McILHENNY, of Greensboro, N. C., died recently at the age of sixty-one years.

JOHN W. METZ, druggist and ex-fire-chief, of Youngstown, O., died June 11th, aged sixty-six years.

Dr. JOHN MONLEZUN, manager of the Workingmen's Co-operative Drug Company's store at Algiers, La., died recently, aged thirty-six years.

Prof. JOHN MORSE ORDWAY, ex-president of Tulane University, died at his home near Boston, Mass., July 5th. He was eighty-six years old.

FREDERICK G. PAULY died June 15th, at College Point, Long Island, N. Y.

J. H. POLHILL, of Fitzgerald, Ga., died recently. He was president of the Georgia Pharmaceutical Association in 1902-3.

CHARLES H. PORTER is dead at Indianapolis. He was forty years old and leaves a widow and two children.

ALBERT REICHMAN, of Joliet, Ill., is dead.

WILLIAM H. SCOTT, one of the oldest druggists in Virginia, died at his home at Richmond, in June. He leaves three children.

HENRY L. SCHULTZ, died June 27th, at Albany, N. Y. He was fifty-three years old.

CHRISTOPHER E. STRUNTZ, of Pueblo, Col., died June 22d, aged thirty-five years.

ARDEN H. THOMAS, of Brewster & Thomas, of Fortville, Ind., died recently, leaving a widow and one son.

RUDOLPH TRUOG, a native of Switzerland, and one of the oldest druggists of this city, died June 26th.

ANDREW M. TUMBLESON, of Baltimore, Md., died June 16th. He is survived by his wife and eight children.

HERMAN J. WATJEN, Civil War veteran, of Vincennes, Ind., is dead.

JOHN W. WHITAKER, aged sixty-two years, died recently at Fall River, Mass.

JOHN LAWRENCE RIKER, one of the most prominent figures in the drug trade of this city, died at his home at Seabright, N. J., July 6th. Born on Long Island in 1830. Mr. Riker entered the employ of B. H. Field, a dealer in

drugs, chemicals, etc., when about eighteen years old, later becoming a partner in the business. In 1860 with his brother D. S. Riker he started the firm of J. L. & D. S. Riker in the same line of business. He remained at the head of this firm until 1901 when he withdrew, the business being incorporated under the same name. Mr. Riker leaves seven children, his three sons conducting the business he founded.

JOHN W. F. WILSON, retired, of South Boston, Mass., died June 5th, aged eighty-one years.

FRED WOLFROTH, of West Bend, Wis., died June 19th, at the age of seventy-seven years.

Mrs. EMMA L. DIEKMAN, wife of Prof. George C. Diekman, of the New York College of Pharmacy, died at their home in Brooklyn, June 22d. The funeral services were held in Brooklyn, June 24th, interment being at New Haven, Conn., where Mrs. Diekman was born, the daughter of Mr. and Mrs. R. C. Cheney. One child, a daughter, shares the husband's loss.

Jamieson Day, 1909.

In the calendar of feast days of the Chicago Veteran Druggists' Association none is printed in redder ink than is June 21st, Jamieson day. This year it was celebrated at the Rienzi, whither the veterans and a few fortunate friends were conveyed in automobiles. June 21st is also flower day of the association and the red carnation shared the honors of the occasion with T. N. Jamieson. The official flower was toasted by Wilhelm Bodemann, as the emblem of courage, honor, friendship and gemüthlichkeit.

President C. W. Grassly made the following recommendations: That each member and associate write his autobiography and send it to the secretary; that each member and associate write his recollections of the Chicago fire; that each year there be celebrated patroness and nestor day, in honor of Mrs. and Mr. T. N. Jamieson; that the design of the official flower be incorporated in the button of the association; and that a special badge of honor be struck for Mrs. Jamieson.

Miss Annie Lloyd, daughter of Prof. and Mrs. John Uri Lloyd, of Cincinnati, and Dr. Odasco C. Welbourn, were married June 23d. The groom is a professor in the eclectic medical college at Los Angeles.

Changes for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue.

No order given to any representative of this paper becomes binding until approved by the publisher or manager.

Questionable or undesirable advertisements will not be accepted.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

cases, and the public understands their import, which, unfortunately the public does not always do, the tables are turned on the malefactors and the just get their due.

Happily for the people of the United States whose stomachs need guarding, at least one man in Washington whose duty it is to aid in the administration of the food and drugs act seems to have shown himself conscientious in the discharge of his duty to the public whose servant he is, and beyond the reach of the corruptionists. This, too, in the face of influences which would have captured a less steadfast man, or, failing in that, would by their persistence have driven him in desperation from the public service. The firm stand of this man for what he evidently believed to be the right has caused an upheaval in administrative circles and has been the cause of the turning of a flood of light upon some of the methods in vogue at the seat of our general government. The conditions thus revealed, while far from inspiring, at least carry a lesson, and if the public does not profit by the knowledge it has gained through the upheaval and consequent light-turning, there are pessimists who will say that they deserve to continue to suffer at the hands of those who have been poisoning and robbing them.

But the public will profit by what it is learning.

Wanted: More Time for A. Ph. A. Business.

When Prof. Edward Kremers, at the meeting of the American Pharmaceutical Association held at Boston last month, moved that the association urge its council to provide ways and means for ridding the general sessions of much of the time-consuming and non-result-producing features which from time out of mind have encumbered its sessions, he but voiced a sentiment which the older working members of the association must have entertained for many years, and the younger ones for as long as they have had cognizance of the association's affairs. While the amendment offered by Dr. E. H. Bartley, to the effect that the matter be referred to the long-standing committee on reorganization, might with great propriety have prevailed, the body evidently was in no humor to order such a pigeon-holing of it, and Prof. Kremers' motion encountered no real opposition. This occurred just after Dr. Solis-Cohen had electrified the association by a masterful address, the delivery of which was an example of what the assemblage might have if it did not consume so much of its time in giving a respectful hearing to other speakers who doubtless do not especially relish being dragged before it to deliver in a lame and perfunctory manner messages which are of no interest or consequence.

There was a time, not many years ago, when such a thing as holding two section sessions simultaneously was new. The idea was resisted, and was put into effect at first as a mere temporary expedient. Now it is the usual and expected thing, although the by-laws seem to provide for the holding of section sessions in a different manner. Sections have grown in number from time to time, even though such a thing

as consolidating two of them into one is not unknown. There are now five sections, and this enumeration does not include the association of boards, the conference of faculties, the syllabus committee, and other smaller bodies, which while not integral parts of the association, yet serve to divide the time and attention of those who attend its meetings, nor does it include the council. A proposition to create another section was submitted at the recent meeting: Prof. Oscar Oldberg proposed that a section on United States Pharmacopœia be erected. That a full and careful consideration of matters pertaining to the Pharmacopœia should be indulged in by members of the association there can be no gainsaying, but the advisability of setting apart a section for the exclusive use of those who wish so to indulge, or of making a new section for any purpose at this time, is questionable. There are so many sections now, that simultaneous sessions, as we have just seen, are necessary, and such sessions are not only unsatisfactory to the members who wish to get all the good possible out of their attendance at the meetings, but are not creditable, as to numbers present, to the sections, or satisfactory to those who present papers for discussion.

With respect to this matter the association seems to be in a dilemma. If it holds two or more section sessions at once, both the active and the passive members lose much of that for which they came to the meetings, and if it discontinues this practice, not enough time will be available for the reading and discussion of papers to make it worth while for members to present them, especially now that the council shows a disposition to limit the publication of these papers to the official organ of the association.

It seems that the motion of Prof. Kremers is a step in the direction of the only feasible way out of the trouble. One week is a short enough time to devote to a meeting of the association when none of it is wasted; to extend the meeting into a second week is hardly practicable; therefore it is plainly the duty of those who are in a position to regulate this matter to see that the dreary superfluities of the meeting are deleted.

The Hallberg Fund.

Although not organized as a charitable or benevolent institution, the American Pharmaceutical Association is composed of a class of men in whose make-up the milk of human kindness has a large place. With the possible exception of the physician and the minister, no man is brought into closer contact with human suffering than the druggist, or has his charity appealed to more often. When the physician administers to the wants of the poor and distressed he gives of his time and his knowledge, when the minister is called upon he responds with sympathy and consolation, but when the druggist is sought, his contribution is of a material kind which represents not only time and knowledge, as well as something of sympathy and consolation, but a tangible asset with a certain fixed value—in short, it represents cash.

No man worthy of the name druggist who has been

in business for any length of time but could tell a tale of medicines supplied to those too poor to pay and too sick to wait. Much is said in the papers about the druggists' shortcomings—actual or supposed—and the alleged funny men crack many jokes about the enormous profits which they assume that he makes, but it is indeed seldom that anyone, even the druggist himself, refers to his donations of services and goods to those who stand in dire need of them and have not the wherewithal to give in exchange. The butcher, the grocer, the coal dealer, and the milkman, must be paid, and the landlord demands his rent, but the physician, the minister, and the druggist—these may wait. These facts seem to raise the druggist out of the ranks of mere tradesmen, and place him in a professional position.

But this is a digression; what we had in mind and desired to call attention to, was the quickness with which the members of the American Pharmaceutical Association saw the need of their help, and the unstinting manner in which they rendered it, when one of their number, cut down suddenly in the strength of a robust manhood, left a home encumbered by debt, a widow without means of livelihood, and a bright young son who needed and very much desired an education. An appeal went forth to the members of the association; a brother who had been so busy serving pharmacy that he had neglected to lay aside money for the rainy day which he thought still a long way off, was dead. A memorial to him was due, and it should take a practical form. Would they contribute the money necessary to save his home and keep his little family together? They would, and they did. Men of moderate means though they were, in the main, they responded with contributions according to their ability, and soon a fund was in hand sufficient to put into execution the plan which its founders had in mind.

In providing a Hallberg memorial fund the American Pharmaceutical Association has erected a monument to that quality in American druggists which is one of their chief characteristics—human kindness.

THERE IS SOMETHING HYPNOTIC about printed things. A woman will believe a statement about a piece of goods when she reads it in an advertisement in the paper, when she would doubt the same statement made to her by a salesman. Let a foolish and freckled girl read in Miss Mazie Mazuma's "Beauty Column" that mazumarine at a dollar a bottle will eradicate her freckles, and she will walk out of the store of an honest druggist who tells her that mazumarine is merely a solution of corrosive mercuric chloride the use of which might disfigure her for life and possibly kill her, and keep on going until she finds somebody who will supply the stuff. That is to say, she has been known to do this and pay her life as a penalty. The girl had been hypnotized by the type and the confidential I've-suffered-too attitude of Mazie (whose real name is Bill). Many's the time some druggist has written to us to say that he finds it hard to convince a customer of something he has told her for her own good, but has been able to carry his point and save her from the result of her own

foolishness by showing her a printed opinion in the CIRCULAR. Let those who have not done so make the experiment of trying to offset printed bosh with printed truth; and if any reader wants our aid in a given case, he has only to call upon us for it.

SNUFF TAKING in North Dakota became so prevalent and its results so harmful that many who studied the question came to the conclusion that the snuff was "doped." Accordingly a law has been enacted by the legislature of that State, which becomes fully operative September first, prohibiting the sale of snuff containing anything other than "pure tobacco, fermented, dried and to some extent pulverized, variously flavored and scented." Especially does the law interdict the sale of snuff to which has been added any "alkaloidal and narcotic constituents which are foreign to tobacco." The penalty for violation of the statute ranges from a fine of not less than five hundred dollars, to confinement in jail for not less than six months.

THAT THE MODERN MATERIA MEDICA is a valuable book for retail druggists, we always believed; and our belief was often strengthened by the words of appreciation in which many of the profession referred to the book. But we underestimated the popularity of the little cyclopedia of the newer remedies; and the second edition published but a few months ago is now out of print. It is our intention to publish a third edition at an early date. Because of the immense amount of labor incident to the collecting of up-to-date data, the new edition will not issue so soon as materially to shorten the usefulness of the second edition.

REAL PROFESSIONAL MEN in the ranks of physicians work primarily to cure their patients, and secondarily for their fees. Quacks work primarily for their fees. The pharmacist who is a real professional man says, If the preparation is fraudulent or dangerous I will not sell it, no matter what the profit, whereas the quack in the drug business would say, No matter how good the preparation I will not sell it if there is more profit to be made on a similar article of less merit which I can sell just as easily.

PERPENDICULAR PELVIS is the "scare head" on an article in an esteemed medical journal. Now we may look for its rivals to get even by publishing essays under such alluringly alliterative captions as "Horizontal Heart," "Longitudinal Lungs," "Oblique Optics," "Kinked Kidneys," and others equally apt.

HEADACHE POWDERS continue to cause sudden deaths, according to circumstantial accounts in the newspapers. A late case was reported from Hastings-on-Hudson. How many deaths they are responsible for which are not attributed to them, nobody can say.

METRIC SYSTEM advocates are alive, and if those who persist in hanging on to the weights and measures of the middle ages do not watch out they will be forced into twentieth-century practices in spite of themselves.

"Never did a little benzoate of soda set up such a chemical reaction," remarks the Ridgeway (Pa.) Record.

This is the month for the N. A. R. D. meeting at Niagara Falls.

hand, he can reduce to exact figures the costs of his doing business, and thus be able to calculate his profits. It is most necessary that he shall know what percentage of his gross sales are consumed by the running expenses, both that he may know what prices he must put on his goods, and what the real worth of his business is. In gaining this insight into things, many items which should be regarded are often forgotten. One must take into consideration all such things as rent, heat, light, clerk hire, interest, taxes, freight, insurance, breakage, and depreciation of fixtures, and not overlook his own salary—the amount he thinks he could get if working for another.

A LESSON IN PERCENTAGE.

Accurate figures against these items and others which will occur to the business man, give him an insight into the nature of things as he makes a price on an article. If he wishes to make a certain profit, he must add the cost of doing business to the invoice price of the goods, and use the sum as his basis in fixing the selling price. Just here, let me remind him that 20 per cent. added to the cost of an article does not mean 20 per cent. profit, for though there are old business men who never have discovered it, when 20 per cent. is added for profit, the profit is only 16⅔ per cent. It is convenient to remember that to make a profit of 20 per cent. one must add 25 per cent. to the cost price, to make 25 per cent. profit, he must add 33⅓ per cent., to make 33⅓ he must add 50, and to make 50 he must add 100. Only if one has something given to him for nothing, and is able to sell it for something, can he make the often quoted, but fabulous, 100 per cent. profit.*

Attention must be given to all matters that affect either our own credit or the credit we extend to others; to the prices we are paying and to the prices we are getting; to the real status of the business judged by a careful analysis of it based on solid fact and not mere guesswork.

IMPORTANCE OF CUSTOMERS.

An x-ray must next be turned upon the people with whom we have to do. They are the chief factor in any business. Without them, every other factor would be worse than useless. Our fisherman friends choose their bait with discrimination, but they must first know what sort of fish they are going after. Our buying, our advertising, our store policy, indeed, everything depends on the kind of people with whom we are to deal. Emerson had a saying to the effect that if a man has what the people want, and has it better than other people, the whole world will make

a path to his door. To supply the wants of the people, the first step is a knowledge of the people.

Here, again, analysis comes into play, and we will call it now, classification. First, we must know where they live, whether in city or country, and we must not forget that what will attract in the city will not in the country. Their needs we must judge from intimate knowledge. The real city dweller is not represented by those who make up what the editor of the social column calls the "smart set," any more than the typical farmer is the character depicted in the funny papers. Let us get into the homes of our customers, if possible, where a glance around will reveal more to us of their tastes and avocations and, therefore, of their needs, than many a shrewd (?) guess.

If we know their financial condition, whether they are properous or poor, it will help us to regulate the quality of what we offer them in our stores. We must also know whether they are liberal or economical with their money. What would appeal to the staid citizen of an old New England town, who believes in making his dollar go as far as possible, is intrinsic value or utility, while the free-hearted, free-handed Colorado miner would pass such an article for something which appealed to him simply as a novelty.

If a druggist is situated near a school, that fact will suggest to him many attractive and profitable side lines, as school supplies, banners, fountain pens, and the like. A nearby railroad station would suggest that a strong push be given the popular magazines and papers, cold and hot drinks, and souvenirs. A factory would suggest that the dealer find out the favorite kinds of goods bought by the workmen, and put forth a special effort to identify his store with their needs. One might multiply instances and enlarge to any length to show how a druggist may profit abundantly from a clear insight into the needs of the classes of people who are to supply his bread and butter, and perhaps his sauce.

POLICIES SHOULD NOT BE ALLOWED MERELY TO GROW.

As Orison Swett Marden says, "A bad plan well worked is better than a good plan not worked," yet many of us do not even get as far as the plan. Our store policies are allowed to form themselves, and are good or bad according to our own personalities. In our look into things, an acid test of our business policies that will dissolve the bad, and allow the good to shine out more brightly, is of use. Are we stingy? Do we refund money cheerfully if anything is not satisfactory? Do we deliver goods grudgingly? Do we allow ourselves to be merely "out of" an article with no word of explanation? What sort of a greeting do our customers get? Are they made to feel at home? Do they come naturally to us when they wish to be accommodated? In short, is ours such a store as men and women, and even the children, like to come to? A look into this will help us to "see ourself's as others see us"—and to our advantage, I am sure, even if to the hurt of our pride.

The "proper study of mankind is man;" the proper study of business is business. If we would gain an insight into ours, we must study it closely, but it is well very often to make it a study by comparison. Other people's experience is cheaper than our own, and if we really know ourselves, we can adapt it to our needs without paying the exorbitant prices some of us are forced to give.

*Percentage of profit is calculated on the investment, not on the investment plus the profit. When a bank lends \$100 for a year, and then collects \$105, the bank's profit is regarded as 5 per cent. on \$100, and not as (approximately) 4⅓ per cent. on \$105. When a merchant buys an article for \$1 and sells it for \$1.50, his profit is 50 per cent., on his investment. Should he sell it for \$2.50, his profit would be 150 per cent. on his investment. A profit of 1000 per cent. is not uncommon. If the merchant pays \$1 for a piece of goods and sells it for \$1.50 there is no reason why he should not say that 33⅓ per cent. of the money he received for it is profit, but the advantage of this form of statement is not manifest. When a piece of goods has been held at \$1 and is marked down to 50 cents, there has been a 50 per cent. reduction; more than a 100 per cent. reduction is impossible, and a 100 per cent. reduction would mean that the article was to be given away.—Editor THE DRUGGISTS CIRCULAR.

What Ideas and Energy Accomplish.

BY AN OBSERVER OF THINGS.

Once there was an old druggist who did things in the old-fashioned way in his store and wondered why business was not better.

His shop had been the business establishment of his father, and his father had made money because he possessed the only drug store for miles around. Besides that, in his father's time there had been no new-fangled things to speak of in use in any of the drug stores. Everything was "ancient."

The son came into possession of the drug store, and for years he, too, flourished. He had passed the fifty-five year mark when I became acquainted with him and his ways. A noticeable, radical change in business methods began at about this time. The son could not understand the reason for the falling off in his business, although on the opposite corner a younger and enterprising man had opened a new drug store with all the fixtures and stock of a modern establishment.

While the old man had no soda fountain at all, and carried his soft drinks in bottles on ice in a box back of the counter, the new man had a first-class fountain which not only paid well but attracted customers. The old man's bottles were often left on the counter after some one had had a drink and the sweet liquid frequently got on packages of drugs or on the sleeves of persons who happened to be careless enough to lean on the counter. Flies collected. Soiled glasses and corkscrews with the corks still on them were to be seen.

The old man also made most of his preparations. He had the old-style mixing devices in the back room and frequently he devoted much time to spreading a plaster while the customer waited.

Things were going along in this way when a stranger struck town and applied at the store for a job. The old man wanted the windows washed and some other rough work done about the place, so he hired the man for a week at two dollars a day. The man went at it in good form and in a few days had things moving in the cleaning up line. Then the man asked to be retained longer. He explained that he had had a little training in the drug business, although he could not fill prescriptions.

The old man told him he might remain a little longer, and he also let him introduce some new methods. For the purposes of this story I shall call the man George.

George purchased some new clothes with his first money and then he proceeded to get points from the man across the way.

George talked the old man into putting in a soda fountain and soon became an expert dispenser of choice soft beverages. The citizens realized that at last the old druggist was striving to get his shop in line with modern styles. There were many willing and steady patrons of the old store, and these people took courage when they saw that the store was undergoing improvement.

George had some advertising ideas which he applied. The drug store was lighted with a motley collection of old illuminating devices. In the back shop there were kerosene lamps and in the front some gas jets. There were candle sticks and tallow dips. George seeing that some of these devices were quite

odd, figured that the public might be interested in them as antiquities. He fixed up some placards for the show window of the store. One placard read:

.....
: THE TALLOW DIP ERA OF :
: ILLUMINATION. :
:

This he placed alongside a tallow-dip utensil in the window, all lighted, on show.

Next to this was a card calling attention to the common candle, and some words about the candle era.

Then there came a card bearing on the kerosene lamp era, near an oil lamp.

The next exhibit illustrated the gas era.

Finally there was an electric arc light suspended in the window, attached to which was an appropriate card referring to the electric-lighting era. Then George fixed up a sign which read:

.....
: These Lighting Eras Illustrate the Prog- :
: ress of our Drug Business from the Begin- :
: ning of Commercial Interests in this Town. :
: This is the Oldest Drug Store in Town, :
: yet we have the Most Modern System of :
: Doing Business. Come in and See. :
:

Passers-by were surprised to see the rows of different kinds of lights representing the advancement made in brilliancy of illumination in years gone by. Regular patrons of the store were surprised to see that the old druggist had decided to change his policy and put in new things to compete with the modern druggists of the community. The surprise was increased when an electric sign bearing the words "Drugs" in twelve-inch letters was swung out one night. The entire block was lighted by its brilliancy. This sign attracted the notice of even speeding automobilists, some of whom stopped and made purchases. It indicated that the store was up to the times.

Meanwhile George had been exceedingly busy inside the store. The old man had learned to place confidence in George, and although the old man "bucked" a great deal George had great freedom. Indeed, the old man depended upon him to a great extent. George ordered new show cases. He encouraged drummers, listened to their words of wisdom mingled with much "hot air," made a distinction between the two kinds of talk and placed orders with reputable houses whose advertisements he had seen in the drug journals. The stock was in a very depleted condition, so the orders were liberal. The old man felt that bankruptcy was at hand, but George had a convincing manner and so was permitted to continue in his course. Besides, the patronage of the store was increased wonderfully, so much so, in fact, that in a little while it was necessary to engage another assistant.

George had got things to moving. His pay was increased. The old man could not get along without him, and he had no idea of leaving. Increased inquiries came in from new customers for articles that the old man never thought of carrying in stock. The margins of profits on some of these special articles were good. Persons inquired for things that they

us get the habit of making our preparations and "de-tailing" physicians, and then we shall reap the profits that some of the nostrum houses are getting now. Let us show pharmaceutical skill; let us furnish them out of our laboratories samples that are true to name, that have the therapeutic properties claimed for them, that are as palatable as human skill can make them.

ACTION, CONCERTED ACTION PREFERABLE, BUT ACTION.

First, last, and all the time, let us aggressively, shoulder to shoulder, press upon the attention of the medical profession a true conception of the importance and value of the services of the pharmacist.

A single idea converted into action is better than a thousand ideas that are unexpressed.

The penny's worth that is sold spells bigger profits than the dollar's worth that stays on the shelf. "A bird in the hand is worth two in the bush."

Say it, with as many frills as you like, the point is this: *Do something*, DELIVER THE GOODS, PRODUCE.

Drinking Cups and Soda Glasses in Colorado.

Colorado is a State to which sufferers from tubercular disease go from all over the country, so a law against the common drinking cups and ordinances against indiscriminate spitting have a peculiar significance there.

At the recent meeting of the Colorado Pharmaceutical Association Charles M. Ford, who has long been a leader in many movements to improve the condition of pharmacy and the public in that State, read a paper in which he discussed the new law there against the public drinking cup and advised druggists to look to their soda glasses.

Two years ago, he said, when Kansas wanted such a statute, many thought it but another example of the freak laws for which that State has acquired an unenviable reputation. Now Colorado has just such a statute. Mr. Ford might have added that so has New Jersey.

Colorado druggists are most concerned about that feature of the law which requires "adequate sterilization" of soda glasses. Mr. Ford says that such sterilization may be brought about by heat only when as high a temperature as 212° F. is employed. As gas and water are plentiful in most drug stores, he calls upon druggists to arrange to wash their soda glasses in boiling water. "Who will be the first," he asks, "to hang this legend above his soda counter: 'All drinks served from adequately sterilized glasses'?" He prophesies that the druggist who does this will reap his reward in plaudits and shekels.

Incidentally, it might not be a bad idea for druggists in other States not to wait for a law requiring them to do this, but to win plaudits and shekels by going ahead of the law and doing it anyhow.

The Dangerous Character of Wood Alcohol.

The dangerous character of wood alcohol is discussed in a paper read at the 1911 meeting of the New York State Pharmaceutical Association by Otto Raubenheimer; which paper was suggested by instructions to the delegates of the New York Branch of the American Pharmaceutical Association to the State meeting. The author gives a brief note on the history of the substance, mentioning the efforts made to introduce it into pharmacy, and the disastrous re-

sults which have followed; quoting reports from the journals of fatal poisoning and of total blindness following its use; such results having followed exposure to the vapor alone. The author notes that notwithstanding these facts "paint shops, department stores, druggists, and pharmacists frequently sell wood alcohol without a poison label, a direct violation of the pharmacy law, as it is one of the articles in schedule B." Some of the labels, he remarks, even recommend it for external application. It is also sometimes labeled "acetone alcohol" without a poison label. The purified spirit is free from acetone. Some physicians are to blame, says the author, as they frequently direct wood alcohol to be used as an external application, especially when the patient is poor. He mentions a case in which he warned a patient of this danger; the physician was again consulted and the patient assured that the spirit was harmless. The author believes that the application of the name "alcohol" to wood spirit "is responsible for the use of this cheap poison in place of the more expensive ethyl alcohol." In Minnesota the spirit must be labeled "wood naphtha," and also "poison." Attention is called to the federal law prohibiting the use of denatured alcohol (which contains wood alcohol) in flavorings, beverages, perfumes, and in all medicinal preparations. The paper concludes with recommendations to the association to discourage the use of the name "wood alcohol," favoring the title "wood naphtha," to condemn the use of the spirit in any preparations for either external or internal use, and to take steps for legislative action on these lines.

Tenacious Insecticide Sprays.

When destroying insects it is of importance to insure a close adherence of the toxic wash or sprayed liquor. The addition of a small quantity of an alkaline soap has been suggested to facilitate this, but it is now shown that the saponins are still more effective, are more widely applicable, and have no action on the vegetation. The fruit of *sapindus utilis*, a tree which has been cultivated for a considerable time in Algeria, is very rich in saponin, and Gastine (*Compt. rend. through Jour. Soc. Chem. Ind.*) reports that 2 grammes of the powdered *sapindus* fruit in 10 liters of water will produce a very fine emulsion with 700 grammes of tar oil. Preferably a heavy tar oil (specific gravity 1.045) and a lighter oil (specific gravity 0.950) are mixed in such proportions that the density of the mixture is about that of water. The surface tension of the saponin solution is lowered by the addition of the mixture of oils and the final mixture has a marked wetting power. Copper salts may be added without increasing the surface tension. A very efficient mixture is water 10 liters, *sapindus* powder 20 grammes, normal copper acetate 100 grammes, mixture of oils (specific gravity 1) 200 c.c. (mils).

Someone has observed that the invasion of England by the American soda fountain may sap the English society drama at its tap-root, which is grounded in tea. And now the life of another form of literature is endangered on account of the invasion of Chinese waters by the American motor boat, for what would war correspondents in the Orient do for copy but for the man on the junk? Is nothing sacred to the iconoclasts?

Abstracts

Warning Against Maretin.

Heubner (*Therap. Monatshefte* through *Journ. Am. Med. Asso.*) protests against some advertising literature recently sent out by the firm making maretin which commends the drug as an antipyretic, especially for the fever in phthisis, the advertisement stating that, according to Prof. Dresser's exact experiments, maretin is not a poison for the blood. This last statement is contrary to reports on the drug that have been published by various clinicians which Heubner cites, and he relates the results of numerous experiments of his own which demonstrate that maretin has a powerful action on the blood, inducing pronounced anemia. It is an excellent means to induce experimental anemia, and the number of cases in which the blood has been injured by maretin is shockingly large, he says, far too large to be shielded by the acceptance of an idiosyncrasy. He adds that the career of maretin is typical: first laudatory reports from clinicians, then words of doubt, warnings and reports of bad by-effects, then a pause; then after a long period of silence, a new propaganda campaign on the part of the manufacturers. Unfortunately, this career of the drug has also a serious side: A leading firm of manufacturing chemists has here overridden the fundamental principles of ethics, for it is unquestionable that a physician would obtain an entirely different idea in regard to the value and disadvantages of maretin from the postals sent out by the manufacturers from what he would obtain by reading up the articles on maretin that have been published in the medical press, especially the warnings by Krönig, Benfey and Steinhauer, in 1905. Heubner adds that it would be well for us to remember that the firm's action in this case might be followed by an aggravation of the condition of hundreds of patients, and that the firm was willing to take this action in spite of its fine equipment and the co-operation of medical experts, including a prominent pharmacologist. What goes on in the inner circles of a commercial enterprise, he continues, is not always above all reproach, and only the liveliest critical co-operation on the part of the rank and file of the profession and its leaders is able to confer the greatest attainable sense of security.

Colorimetric Determination of Antimony.

Schidrowitz and Goldsbrough (*Analyst*) say that the coloration produced by passing hydrogen sulphide through a solution containing small amounts of antimony can be employed as a means of determining the quantity, if solution of acacia is used to cause the precipitate to assume the colloidal condition. If the solution is hot when the hydrogen sulphide is passed in, the colors will be deeper in tint. Ordinarily the use of solutions at ordinary temperatures will suffice (down to 0.02 mgm. Sb). The standards are made up by dissolving weighed amounts of tartar emetic. Comparisons are made in bulks of 10 c.c. (mils) to which in every case is added 0.1 c.c. (mil) of a 10 per cent. solution of acacia. The solutions are then saturated with hydrogen sulphide. Of course, other members of the hydrogen sulphide group interfere. Organic matter does also. In case of the presence of such substances, the antimony may be precipitated

out by heating with metallic copper, and then dissolved off the copper by warming with potassium hydroxide and a little permanganate. After filtering from the copper, etc., the excess of permanganate can be destroyed by tartaric acid and aliquot portions of the solution submitted to the test.

Fresh and Dry Belladonna and Hyoscyamus.

Danckwortt (*Arch. Pharm.* through *Pharm. Journ.*) in consequence of the replacement in most pharmacopœias of the old green extracts of belladonna and hyoscyamus by those from the dry drugs has made a comparative estimation. Six extracts were accordingly prepared as follows from the same lot of belladonna, collected when flowering: (1) the whole sub-aerial herb was pressed and an extract prepared by the method of the Ph.G. IV. (2) A similar extract was prepared from the fresh leaves only. (3) A portion of the fresh herb was carefully dried so that it retained its green color, the weight of the dry product in coarse powder constituting 12.66 per cent. of the weight of the fresh; an extract was made by percolating this with 70 per cent. alcohol until Mayer's solution showed that no more alkaloid was being extracted, and evaporating the percolate to extract consistence. (4) Another portion was dried and percolated in the same way, the alcohol distilled off, and the precipitated chlorophyll and resin filtered out, and the filtrate evaporated to extract consistence. (5) This was prepared in the same way as (3), but from the leaves only. (6) This was prepared in the same way as (4), but from the leaves only. The alkaloidal content and ash of each of the extracts was ascertained by analysis; the amount of moisture was also determined, and the alkaloid and ash figures calculated for extracts of uniform content of 15 per cent. of water. The following results were obtained (all figures in percentages):

	Yield of Extract		In Extract	
	Of Fresh Drug.	Of Dry Drug.	Ash.	Alkaloid.
(1).....	1.88		19.03	1.699
(2).....	2.02		18.91	1.207
(3).....	3.97	31.30	17.34	1.917
(4).....	3.37	26.60	19.05	2.203
(5).....	5.38	29.88	12.35	1.282
(6).....	4.52	25.55	14.67	1.407

The figures seem to show that (a) the leaves contain less alkaloid than the whole herb; (b) by percolation of the dry drug an extract is obtained richer in alkaloid than by evaporation of the pressed-out juice, and also a larger yield; (c) the dried leaves give more extract, but less alkaloid than the dried herb. It is also pointed out that 10 per cent. of moisture, adopted by the Brussels International Agreement, is too low for a thick extract, and 15 per cent. is proposed. Extracts were also prepared from henbane: (1) from the fresh herb by the method of Ph.G. IV. and (2) from the dried leaves by percolation. These were analysed, and the figures corrected to represent extracts containing 15 per cent. of moisture. The results were as follows:

	Yield of Extract		In Extract	
	Of Fresh Drug.	Of Dry Drug.	Ash.	Alkaloid.
(1).....	1.7	...	19.24	0.146
(2).....	1.7	20.5	15.80	0.355

The general conclusion being thus similar to that in the case of belladonna (except as to the proportion of alkaloid in the leaf and herb).

Separation of Urobilin from Urobilinogen.

Fresh urine, it is said, never contains urobilin, but only its chromogen, urobilinogen, which, when the urine is shaken with chloroform, is dissolved by the latter, and gives, after being oxidized to urobilin, the characteristic green fluorescence with alcohol zinc acetate solution. Urobilinogen can also be detected in the chloroformic solution by Ehrlich's reagent (paradimethylaminobenzaldehyde) in the presence of alcohol. When, according to Grimbert (*Compt. rend.*), the chloroformic solution of urobilinogen is shaken with a solution of disodium phosphate, neutral to phenolphthalein, only free urobilin is taken up by the aqueous liquid, while the chromogen remains in the chloroform. For separating urobilin from its chromogen the following method is recommended by the author. The urine is shaken with chloroform, the chloroformic solution filtered through cotton and the filtrate mixed with an alcoholic 0.1 per cent. solution of zinc acetate until the precipitate first formed is redissolved. A green fluorescence shows the presence of free urobilin. If the latter is present, the chloroform is first shaken with a few c.c. (mils) of a disodium phosphate solution, neutral to phenolphthalein, by which the urobilin is extracted. The chloroform when then treated with an alcoholic zinc acetate solution does not give a green fluorescence, the latter, however, being produced by the addition of a trace of iodine, when urobilinogen is present.

Reaction for Glucuronic Acid.

If a small amount of glucuronic acid is dissolved in one-half c.c. (mil) of hydrogen dioxide solution and the solution is mixed with 1 or 2 drops of a 15 per cent. alcoholic solution of the b-naphthol an emerald green color will be produced on the careful addition of 3 to 4 drops of concentrated sulphuric acid; on shaking, the liquid will acquire a blue color. According to Goldschmied (*Zeit. physiol. Chem.*) this test can be applied for the identification of coupled glucuronic acids in urine also. One-half to one c.c. (mil) of urine mixed with two drops of the naphthol solution is carefully poured on 3 or 4 c.c. (mils) of concentrated sulphuric acid. A violet ring will appear at the zone of contact of the two liquids. After allowing to stand for fifteen minutes and shaking, the liquid will be colored emerald-green. According to the author the presence of 8/1000 of a milligram of glucuronic acid in urine can be proven by this reaction.

Artificially Cooled Hospitals.

Woodruff (*Am. Medicine*) thinks it amazing that the medical profession has made so little therapeutic use of cold-producing machinery. He instances the increase in mortality from many diseases as the temperature of the atmosphere rises, and the corresponding benefit when it falls. There is no reason, he says, for helplessness; it is a simple matter to cool the air of hospitals. The system is in practical operation in other buildings and has been for many years. All that is needed is a "steam-coil" or "radiator" in which cold brine circulates instead of hot water. Instead of "radiating" heat, it is an "absorber," and the air forced around the pipes may be cooled to any required degree. The pumps and fans being run by

electricity, there is no engine to bother with, and the ammonia which may leak out will not annoy one if the apparatus is in the basement. The air is damp when it leaves the coils, but it warms up en route to the room or can be warmed so as to be delivered dry. The coils, of course, drip moisture deposited from the air as it is cooled and can not be put in the living room. The air should be delivered near the floor, and the escape valves put at the ceiling for the warmed impure air. From personal experience of the benefit of the reduction of air temperature by storms in the tropics, the author has no doubt that if all tropical hospitals were so equipped the record of cures would be several times what they now are, and the home-going stream of invalids enormously reduced. Panama needs such rooms and so do the Philippines.

Diluent for Leucocyte Counting.

Pitfield recommends (*N. Y. Med. Journ.*) for use in counting leucocytes, a diluting fluid made as follows: Dissolve 20 grammes of acacia in 50 c.c. (mils) of distilled water; add to this solution 50 c.c. (mils) of glacial acetic acid, and 0.1 gramme of gentian violet; mix well; warm; and, while warm, filter through a wet filter. The advantages of this fluid are its viscosity, which precludes its flowing out of pipettes too easily; that pipettes can be filled more accurately; that neater definite-sized drops may be slowly put into the counting chamber; filled pipettes may be carried without fear of spilling the contents; the leucocytes do not settle in the mixing chamber quickly, and remain evenly distributed throughout the fluid; the end of the pipette must be wet before the fluid can be blown out; the end of the pipette is sealed with the acacia. The fluid has its disadvantages: It takes longer to suck up the diluting fluid and a little longer to mix blood and fluid; the fluid is sticky; and pipettes are harder to clean. But the greater ease of controlling the fluid and accuracy recommend it to busy operators.

Increasing the Solubility of Thiosinamine in Water.

The solubility of thiosinamine in water is increased by the addition of sodium salicylate. Since many persons have an idiosyncrasy toward the salicylates other substances were tried to replace the latter. Merck (*Chem. Zeit.*) has found that the addition of sodium baborate, sodium benzoate, sodium cinnamate, glycolcol, and urethane likewise increase the solubility of thiosinamine in water. If, for instance, the aqueous solution of one molecule of thiosinamine and one-half a molecule of sodium baborate is evaporated to dryness, a crystalline residue will be obtained which is very soluble in water.

Estimation of Glucose.

Selvatici (*Rev. pharm. Flandr.*) proposes the following method for estimating glucose, using potassium ferrocyanide as an indicator. In a test tube, 25 cm. long and 35 mm. wide, a mixture of 10 c.c. (mils) of Fehling's solution and 10 c.c. (mils) of an aqueous 15 per cent. solution of potassium ferrocyanide is heated to boiling. From a burette the liquid under examination is then added drop by drop until the mixture has become colorless.

Estimation of the Acidity in Hydrogen Dioxide Solutions.

Woehler and Frey (*Ann. chim. analyt.*) have found that the acidity of hydrogen dioxide solutions can be accurately determined by titrating with N/10 alkali, using phenolphthalein or methyl orange as an indicator. The titration of the acid in the presence of the former indicator can be carried out in the cold, without previously destroying the H_2O_2 , if the percentage of the latter does not exceed 3 per cent. The authors recommend, however, the use of correction factors, which they have determined by numerous experiments. It was also found that natryl hydrate, which, according to Tafel, is formed by the action of hydrogen dioxide on sodium hydroxide, is a much weaker base than the latter and acts like ammonia towards phenolphthalein and methyl orange. The authors further found that by using two drops of a 0.04 per cent. solution of methyl orange the acidity in solutions containing as high as 30 per cent. of H_2O_2 can accurately be determined. This indicator naturally can be used only for the estimation of mineral acids; if organic acids or boric acid are present, phenolphthalein has to be used and if solutions with a high percentage of H_2O_2 are to be titrated the latter has previously to be destroyed by the addition of platinum black or by other means.

A New Alkaloid of Corydalis.

The isolation of a new alkaloid from corydalis tubers has been reported by Gadamer (*Arch. Pharm. through Journ. Soc. Chem. Ind.*), to which has been applied the name corycavidine. The free bases were converted into the thiocyanates and the latter were crystallized from alcohol, being separated into portions sparingly and easily soluble therein. Corycavidine was isolated from the portion readily soluble in alcohol. The base has the composition, $C_{22}H_{25}NO_5$, and crystallizes from chloroform with one molecule of the solvent. It melts at 212° to 213° C., and has a specific rotatory power of $+203.1^\circ$ in chloroform. The molecule contains two methoxyl, and one N-methyl group. On exhaustive methylation it yields a methine base, melting at 141.5° to 142.5° C., an unsaturated substance containing no nitrogen, and trimethylamine. When corycavidine is heated it is converted into an optically inactive base, melting at 193° to 195° C. after crystallization.

A New Glucoside from Digitalis.

Kraft (*Schweiz. Woch. through Chemist and Druggist*) has isolated a new glucoside from the leaves of digitalis purpurea, which he has termed git-alin. It is an amorphous white powder, giving a crystalline hydrate melting at 75° . It is soluble in 600 parts of water, and in all proportions in chloroform.

Some Derivatives of Gelsemine.

Moore (*Proc. British Chem. Soc.*) says that gelsemine, $C_{20}H_{22}O_2N_2$, is stable towards alkali hydroxides and reducing agents, but with oxidizing agents the molecule is decomposed, and no definite products have been obtained by this means. On boiling gelsemine with concentrated hydrochloric acid for some hours, three new bases are formed, which have been designated as apogelsemine, isoapogelsemine, and chloro-isoapogelsemine. Of these, apogelsemine,

$C_{20}H_{24}O_3N_2$, is the chief product of the reaction, and although it cannot be crystallized, it yields well characterized, crystalline derivatives. Chloro-isoapogelsemine, $C_{20}H_{23}O_2N_2$, and its hydrolytic product, isoapogelsemine, $C_{20}H_{24}O_3N_2$, are only formed in relatively small amounts. Both these bases crystallize readily.

Detecting Benzene in Gasoline.

Halphen (*Mat. Grass. through School Mines Quart.*) says that benzene is often used as an adulterant in or partial substitute for gasoline sold for use in engines. The specific gravity is something of a guide to the presence of the adulterant, gasoline having a gravity of 0.702 to 0.803, while the mixtures run from 0.750 to 0.760, benzene being 0.880. For the quantitative determination of benzene the author suggests nitrating by the slow addition of 10 c.c. (mils) of fuming nitric acid (4 or 5 drops at a time) which is kept cool, the mixture being frequently shaken. After nitration, 10 c.c. (mils) of water are run in, a little at a time, and then 40 c.c. (mils) at once, when by shaking the nitrous vapors are absorbed. The oil is eventually treated in a graduated cylinder with concentrated sulphuric acid and the increase in bulk of the acid is read off. This increase multiplied by 0.87 gives the volume of benzene present. As most oils are acted on to some extent by H_2SO_4 alone, it is necessary to precede the operation by shaking with some concentrated H_2SO_4 and using the purified material for the test.

Injurious Effect of Alcohol Denatured with Wood Naphtha.

Horbaczewski (*Est. Chem. Zeit. through Journ. Soc. Chem. Ind.*) reports that the Bohemian sanitary authorities recommend that the use of wood spirit should no longer be permitted for denaturing alcohol for any purpose, as it is found that the health of those working with such denatured alcohol is liable to be seriously affected by the more or less poisonous impurities contained in the wood spirit, the spirit itself being also more poisonous than ethyl alcohol. For polishing and lacquering it is already permitted to use alcohol denatured with 5 per cent. of oil of turpentine or with pyridine bases, both relatively harmless mixtures, but the use of shellac is advocated as a denaturing agent for these industries. It may be added that it is well established that the toxicity of methyl alcohol includes a specific effect on the optic nerve, causing permanent blindness and that this effect as well as others may occur from exposure to its vapors.

Benzol Poisoning.

Oxholm (*Norsk. Mag. f. Lægevidenskaben through Journ. Am. Med. Asso.*) reports a fatal case of poisoning apparently caused by benzol. A man was wiping out the inside of a septic tank with a proprietary preparation used for the purpose, called siderosthen, when he collapsed, and died soon after being removed from the tank. The substance contained benzol and the author ascribes the fatality to this, reviewing what has been written on benzol in the literature. Schmidt-Nielsen has recently reported a case of poisoning from benzol fumes, emphasizing the importance of ample ventilation when benzol in any form is used in manufacturing.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Sterilization of Organic Arsenic Preparations.—"Hospital Pharmacist," Illinois, writes: "I should like to have some information on sodium cacodylate, atoxyl, salvarsan, etc., as to the amount of heat that may be employed with safety in making sterile solutions."

Because of the comparatively recent introduction of the organic arsenic compounds, and particularly the hypodermatic and intramuscular injection of them, there is a paucity of literature on their pharmacal preparation. We have found no direct reference to the effect of heat upon sodium cacodylate and atoxyl but are led to believe they are not decomposed by a temperature of 100° C. by the statements made in several French pharmacal works as to their solubility in boiling water. This belief is strengthened by a statement made by Dr. S. L. Dawes in a contribution to a recent number of the *Journal of the American Medical Association* on "The Therapeutic Value of Sodium Cacodylate." Dr. Dawes said:

My present method [of administering sodium cacodylate intramuscularly] is to have the pharmacist weigh out for me a number of doses: 0.1 gramme, 0.15 gramme, 0.2 gramme, and 0.3 gramme, and place them in sterile half-dram vials, tightly corked; this protects this most hygroscopic drug from the effects of the atmosphere. At the time of injection, the dry salt is emptied into the barrel of the sterile syringe into which boiling water is drawn until all the salt is dissolved.

Relative to salvarsan, we submitted our querist's communication to Victor Koechl & Co., the American licensees for the sale of that substance, and they replied as follows:

Salvarsan (Ehrlich's 606) is, as contained in the ampuls, absolutely sterile. The recommendation is made on the circular of instructions enclosed, that solutions be made, before applying, with distilled sterilized water, or that sterilized physiological salt solution be used as a menstruum. The technic requires further that all apparatus, utensils and reagents, as well as the hands of the operator should be sterilized before beginning to make the solutions and when this is accomplished, no further sterilization is needed.

We would hesitate to inform you that solutions of salvarsan could be sterilized after making. Heat, even of a moderate degree above body temperature, would doubtless disturb the chemistry of salvarsan. Further we would like to state that remaining portions of a salvarsan solution, those kept from one operation to another, should never be used. We think it altogether probable that your correspondent has this in mind, in asking how to sterilize salvarsan solutions. We would advise you to make this perfectly plain, that remaining portions of salvarsan in powder form or solution should be destroyed and never used on a second patient.

Ascertaining the Strength of Hydrofluoric Acid.—V. L. C., New York.—Inquiry among the makers of chemical apparatus has not enabled us to find a hydrometer suited to your purpose. It is obvious that an ordinary glass or metallic instrument would not answer the purpose; and the easiest way to get around this would be to take a typical glass acidometer, coat it with paraffin by dipping it in the melted

fat, and compile a table of constants by testing known dilutions of HF. The difficulty of preserving the coating and the weight of this instrument would probably be not the least of the drawbacks incident to its use.

A suitable instrument could perhaps be made of a piece of hard-rubber tubing weighted with lead and standardized in known dilutions. As hydrofluoric acid does not attack lead to a perceptible extent, a lead pipe might be employed instead of the hard-rubber tube.

Because of the difficulty of standardizing such an instrument it would seem to be much more practicable to ascertain the specific gravity by weighing a sample of the acid in a tared paraffin capsule and comparing the gravity with a table of weights of known dilutions. Watt says that the concentrated acid has the specific gravity 1.250 and that a gravity of 1.150 denotes an acid containing 35.37 per cent. of HF. The acid is constant under ordinary conditions when containing from 36 to 38 per cent. of HF.

All in all it would seem that to determine the percentage of HF volumetrically would be the simplest way to ascertain the quality of the acid. In undertaking such a determination it should be borne in mind that the commercial grades of the acid contain varying proportions of sulphuric acid, sulphurous acid, and hydrofluosilicic acid—a fact which interferes also with accurate calculations from specific gravity. A method for determining the real amount of HF is given in most text-books on volumetric analysis.

The greatest care should be taken to avoid getting the acid on the skin as it produces very intractable "burns."

Perfumes for Toilet Preparations.—G. W. S., Kentucky.—As a perfume for your massage cream you might experiment with the following:

Solution of heliotropin, (10%)	10 c.c. (mils).
Solution of cumarin (10%)	20 c.c. (mils).
Oil of rose geranium	20 c.c. (mils).
Oil of rose	5 c.c. (mils).
Oil of bitter almond	10 c.c. (mils).

A little experimentation will enable you to readjust the proportions of the ingredients to your desire, in case the foregoing mixture does not fulfil it.

As a perfumed vehicle for the hair tonic we offer the following:

Oil of bergamot	4 c.c. (mils).
Oil of lemon	3 c.c. (mils).
Oil of cedrat	7 drops.
Oil of clove	2 drops.
Oil of lavender	1 c.c. (mil).
Oil of petit grain	2 drops.
Oil of rosemary	1 c.c. (mil).
Oil of red thyme	1 c.c. (mil).
Saturated solution of artificial musk	5 c.c. (mils).
Saturated solution of rhodinol	10 drops.
Cologne spirit	400 c.c. (mils).
Orange flower water	30 c.c. (mils).
Rose water	120 c.c. (mils).
Distilled water	to make 1,000 c.c. (mils).

Some other formulas which might aid in securing a valuable individuality for your preparations appear in the CIRCULAR for November, 1910, page 574; and July, 1909, page 344.

To Distinguish Ethyl Alcohol from Methyl Alcohol.—R. A. S., Illinois.—Perhaps the most satisfactory differentiating test for ethyl and methyl alcohols is that suggested by Klein (*Journ. Ind. Eng. Chem.*), which is as follows:

A few cubic centimeters of the spirit are taken and to this are added 1 or 2 drops of selenic acid and a trace of silver bromide, or other halogen salt of silver. A white amorphous precipitate is obtained with ethyl alcohol. With methyl alcohol either no precipitate at all or a crystalline one with a clear supernatant liquid is obtained.

To detect methyl alcohol in ethyl alcohol the Hinkel method is most favored. This is, briefly, as follows:

Add to 1 c.c. (mil) of the mixture to be examined, 0.8 gramme of ammonium persulphate, and 3 c.c. (mils) of diluted sulphuric acid (1 in 5); then make up to 20 c.c. (mils) with water, and distil over five different portions of 2 c.c. (mils) each. The first two portions, which contain acetaldehyde, are rejected; the remaining three are tested for methyl alcohol by adding to the liquid a few drops of a $\frac{1}{2}$ per cent. solution of morphine hydrochloride, and underlayering the mixture with concentrated sulphuric acid. If methyl alcohol is present, a violet zone will be produced at the point of contact of the two liquids.

Other methods are described in the CIRCULAR for July, 1910, page 357; March, 1910, page 115; and October, 1909, page 520; and in a number of earlier issues.

White Camphor Liniment.—V. M., Kentucky.—We offer a few formulas; the first is one which has proven satisfactory in our hands.

I.

Camphor	100 grammes.
Ammonia water.....	225 grammes.
Sesame oil.....	675 grammes.

Dissolve the camphor in the oil; add the ammonia water, and emulsify by shaking.

II.

Camphor	100 grammes.
Ammonia water.....	375 c.c. (mils).
White of.....	1 egg.
Oil of turpentine....	to make 1,000 c.c. (mils).

Dissolve the egg-white in the ammonia water, and the camphor in the oil. Mix the two solutions and shake vigorously.

III.

Soft soap.....	75 grammes.
Camphor	50 grammes.
Oil of turpentine....	to make 1,000 c.c. (mils).
Distilled water.....	to make 1,000 c.c. (mils).

Triturate the soap with 100 c.c. (mils) of the water until the mixture is homogeneous; add gradually with constant trituration the camphor dissolved in the oil. When the mixture becomes creamy, triturate in enough distilled water to make the required volume. This is the British Pharmaceutical Codex formula for *liniment of turpentine*.

Bird Lime.—C. J. A., California.—The mode of preparation of this substance is quite simple. The middle bark of European holly, *ilex aquifolium*, is boiled in water for about eight hours, after which it is taken out and put in a suitable vessel and set away

in a cool place, sometimes in pits under ground, and allowed to remain for two or three weeks, during which time it ferments and becomes very viscous. A little water may be added to assist fermentation. It is then taken out, pounded into a paste, washed in running water, and kneaded till it is free from all impurities, or nearly so. Next it is placed in earthenware vessels and set aside for three or four days, when it again ferments and frees itself from impurities. It is then known as bird lime and is fit for use.

A similar process is employed in preparing it from mistletoe, elder and many other plants in which it is present.

Good bird lime is of greenish color, and should resemble boiled linseed oil in some of its physical properties, tenacity and stringiness, for instance.

A substitute for bird lime is made by boiling linseed oil until quite thick; or by melting together 7 parts of rosin with 3 of linseed oil.

Yellow Tinted Compound Syrup of Hypophosphites.—M. C. M., South Carolina.—In view of your statement that the solution of the ferric and the manganese hypophosphites was "rather dark," the yellow tint of the finished syrup is doubtless an indication of the change of some of the ferric salt into the ferrous state. This change may have preceded the operation of dissolving the salt, or it may, as you remark, have been occasioned by the improper application of heat in effecting solution. We are not quite sure that you used the official process, as you refer to "dissolving the iron and manganese hypophosphites in the acidulated water"; whereas in the official process it is directed to dissolve these two salts in water with the aid of the sodium citrate. The only suggestion we have to offer—you say that the chemicals were purchased as being of official quality—is that you look well to the storing and keeping of the salts; assure yourself of their quality and that of the water and the sugar; and eliminate all possibility of the reduction of the ferric salt by heat or atmospheric influence: it is well to make the solution of the ferric and the manganese hypophosphites in a stoppered flask.

Mullein Oil.—J. G. H., Massachusetts.—The following reference to this preparation is made in the United States Dispensatory, nineteenth edition:

An oil, produced by saturating olive oil with mullein flowers, during prolonged exposure to the sun, is used in Germany. . . . The mullein oils sold in pharmacies are of this nature, or, some of them, alcoholic tinctures.

King, in the American Dispensatory, says:

The [mullein] flowers, placed in a well-corked bottle, and exposed to the action of the sun, are said to yield an excellent relaxing oil.

The so-called homeopathic mullein oil is a tincture prepared from freshly gathered flowering plants by maceration with a hydro-alcoholic menstruum. The color of the tincture varies from a dark-brown when prepared with 50 per cent. alcohol, to greenish with 85 per cent. spirit or stronger.

Generally mullein oil is prepared by packing a suitable glass container rather tightly with the flowering tops of mullein, pouring in enough olive oil or cottonseed oil to fill the container, and exposing the not-too-tightly stoppered container to the rays of the sun for several months.

Solution of Aluminum Acetate.—John Roemer, New York, contributes the following constructive criticism of the official process for making Liquor Alumi Acetatis N. F.:

The National Formulary process for making solution of aluminum acetate is objectionable from a practical viewpoint in that the calcium carbonate does not form a perfect solution with the indicated amount of acetic acid. [It has been argued that the excess of calcium carbonate is intended to interact with the aluminum sulphate to form aluminum hydroxide and thereby assure a basic aluminum acetate. If this be the case the N. F. directions to "dissolve the calcium carbonate in the acetic acid," etc., are faulty.—Editor THE DRUGGISTS CIRCULAR.] And the amount of the salt that is dissolved being uncertain, when mixed with the solution of aluminum sulphate, will yield a product containing an uncertain percentage of aluminum acetate. Further, sedimentation, decantation and finally filtration will yield a solution at first perfectly clear, but subsequently becoming turbid.

Having recently been called upon to perfect a working process I found that the formula given herewith was all that is to be desired:

Calcium carbonate, U. S. P.....	130 grammes.
Acetic acid (90%).....	156 c.c. (mils).
Aluminum sulphate, U. S. P.....	300 grammes.
Water, a sufficient quantity.	

Mix the calcium carbonate with 350 c.c. (mils) of water; add the acetic acid in small portions, stirring after each addition; then heat over a free flame until the disengagement of gas ceases, keeping the volume constant by adding water from time to time as required. Dissolve the aluminum sulphate in 750 c.c. (mils) of water; add this to the hot solution of calcium acetate; and bring the whole to the boiling point. Allow to cool and stand for four hours and filter, adding sufficient water to make 1300 c.c. (mils).

We are indeed grateful to Mr. Roemer for his tangible display of interest in the Notes and Queries department. The subject to which he has added the foregoing valuable contribution is one of such wide import that we feel that he has merited the gratitude of American pharmacy. Mr. Roemer is a student and a worker; and we trust he will continue to favor us and our readers with the results of his labors.

Precipitation in Solution of Aluminum Acetate.

—J. W. H., Ohio.—The deterioration of solution of aluminum acetate is due to the loss of acetic acid and the absorption of carbon dioxide. It is believed that these actions are proportionate to the amount of calcium sulphate present. The precipitation may be considerably retarded and in many cases prevented by the addition of 0.25 per cent. of boric acid to the freshly prepared solution. By adding 0.5 per cent. of boric acid to a solution in which precipitation has already taken place it is often possible to restore the liquid to its normal appearance.

Like many other untoward results in pharmacal operations, this precipitation may be more easily prevented than remedied. In the preceding note, one practical pharmacist describes his method of overcoming the difficulty; and in the CIRCULAR for January, 1911, page 41, and August, 1909, page 401, appear descriptions of other processes for making a permanent solution. In the issue for May, 1908, page 224, appears an exhaustive note on "The Chemistry of Solution of Aluminum Acetate," a valuable reference in this connection.

To Decolorize Reddened Phenol.—R. S. C., Idaho.—You might try shaking each liter of the liquefied phenol with about 3 grammes of white woolen threads. Zinc dust has been recommended

for the same purpose. Another plan is to add alcohol to the phenol and reduce the temperature until the latter crystallizes out, colorless.

It has been stated that the red color which develops in phenol is caused by phenoquinone, which, in turn, is formed by oxidation and condensation when quinone or catechol is present. The addition of $\frac{1}{4}$ of 1 per cent. of sulphurous anhydride to liquefied phenol is said to prevent the coloration of the latter. The chemistry of the color has been studied by Gibbs (*Philip. Journ. Science*; 1908) and Külb (*Pharm. Zeit.*, 1905).

Compound Solution of Cresol.—There is apparently an unflagging interest being taken in the efforts to perfect a process for this popular preparation. Experimenters in this field are legion; and it seems that, as in all human endeavor, the personal equation is a most potential factor. The latest contribution on the subject that reaches us is from H. W. S. Carter, Indiana, who writes as follows:

The article in the August number of the CIRCULAR [page 419] on Cresol and Its Compound Solution, together with the large number of arguments and criticisms prevalent during the past five or more years, has caused me to sit up and say something. It has caused me to wonder if I am "away off" or if the "rest of them" are.

Being only a graduate in pharmacy, I have been loath to state my experiences with official preparations, expecting that in a short time some one better versed in the subject than I am would make it clear to me just *why* the preparations I have made have not been satisfactory. With one or two exceptions I have never had trouble with official formulas—one exception was with tincture of cudbear in the compound digestive elixir. I have made the compound solution of cresol, U. S. P., dozens of times, and have always had a perfect solution both in appearance and action. One physician has told me that he could not get a good solution at any of the other places in the city that he had tried, the other preparations being ropy or immiscible with water. He also stated that the one which I made was less irritating to the mucous membrane than a certain proprietary.

While I may not be as keen as others, it is my belief that the great majority do not treat the Pharmacopœia as *law*, but only as a handy reference book to save them the trouble of remembering names and quantities. Many allow little ideas of their own to creep in; and, often times, this is responsible for a failure to produce a perfect preparation. This and inaccuracy in weighing and measuring I believe to be the main reasons for so much trouble.

Despite his self-detraction, Mr. Carter appears to possess the valuable faculty of getting at the crux of a situation or condition, and the equally valuable faculty of adhering to the letter of his instructions. In pharmacy as in railroading or in military operations, these two attributes make much for success.

Preparation of Santalol.—L. A. S., Michigan.—Parry, in his Chemistry of Essential Oils and Artificial Perfumes, says that he prepared pure santalol in the following manner:

One hundred grammes of East Indian sandalwood oil of specific gravity 0.977 and saponification figure 0.44 and containing 94.1 per cent. of santalol were heated to 80° with an equal weight each of phthalic anhydride and benzene upon a water-bath for one hour; the acid esters formed were combined with alkali and dissolved in an excess of water. The aqueous solution was deprived of the non-alcoholic constituents by agitation with ether, repeated three times, and the acid esters were separated by the addition of diluted sulphuric acid; subsequently they were saponified by means of alcoholic solution of potassium hydroxide, and the santalol set free was deprived of adhering alkali and alcohol by washing it with water. The product obtained amounted to 85 per cent. of the oil used.

Quick-Drying Ink for Printing.—E. D. A., Illinois, wants a formula for blue and black inks to be used on a roll paper printing machine, quick-drying inks that will not smear when the paper is used for wrapping. It seems to us that an ink similar to that used for cancelling postage stamps would answer the purpose. Such an ink can be made as follows:

I.

Ultramarine 1 ounce.
 Linseed oil..... 1 ounce.
 Olive oil..... a sufficient quantity.

Reduce the ultramarine to an impalpable powder; triturate with the linseed oil and about 2 ounces of olive oil, and add enough olive oil to produce the proper consistency.

II.

Oil-soluble anilin blue..... 1 ounce.
 Crude oleic acid..... 1 ounce.
 Castor oil..... 8 to 10 ounces.
 Make a solution.

III.

Paris blue..... 10 parts.
 Ultramarine 20 parts.
 Borax 5 parts.
 Shellac 5 parts.
 Alcohol 30 parts.
 Water enough.

Dissolve the shellac in the alcohol, and the borax in 40 parts of water; mix the two solutions. Mix the pigments intimately, reducing them to the finest state of division; triturate or levigate the mixed pigments with the borax-shellac liquid, adding more water if necessary. The addition of a little glycerin may be necessary in a dry climate.

IV.

Ultramarine 2 parts.
 Gum arabic..... 1 part.
 Glycerin 4 parts.
 Water enough.

Dissolve the gum arabic in about 6 parts of water; mix with the glycerin. Triturate the pigment, which must be in the form of a very fine powder, with the liquid, adding more water as may be required.

For black inks lampblack or oil-soluble nigrosin are the pigments required. Anilin colors can be used for the inks in which the pigment is suspended, if made into a lake with china clay.

"Fast" Red Ink.—J. S. K., Missouri.—We have no reason to believe that the composition of the ink to which you refer has ever been divulged by the manufacturers. The so-called "durable" red inks, which may be what you desire, contain sodium silicate. Here are typical formulas:

Winckler's Durable Red Ink.

Carmine, finely powdered..... 6 parts.
 Solution of sodium silicate..... 75 parts.
 Distilled water..... 675 parts.

Triturate the pigment with the water-glass; gradually add the water; set aside for several days, and decant the fluid ink.

Böttger's Red Ink.

Carmine 5 parts.
 Sodium silicate..... 5 parts.
 Solution of sodium silicate, a sufficient quantity.

Triturate the carmine with the sodium silicate—both should be in the form of fine powder—and add enough of the solution to make a fluent ink.

If an indelible ink is wanted, a number of formulas may be found in the CIRCULAR for May, 1910, page 235; formulas for red inks of several types appear in the issues for October, 1910, page 516; and June, 1908, page 275.

Regents' Counts under the Old New York Pharmacy Law.—C. M., New York, writes:

What was the substance of that section of the rules and regulations of the old *New York State Board of Pharmacy* which referred to the preliminary education requirement necessary to enter a recognized college of pharmacy?

What I would like to know in regard to this is: Under the old board, that is, the one which was in force before the regents were connected with it, could a student enter a college of pharmacy under conditions, with the understanding that the conditions must be worked off before entering the second year of the course?

The present pharmacy law of this State was signed by Governor Hughes June 8th, 1910. The law in force prior to that time—and until the provisions of the later statute became effective—was the one passed in 1900, with various amendments. Section 233, subdivision 6, of that law provides that the school of pharmacy must "require as a condition for entrance a satisfactory examination in subjects designated by said regents of not less than twelve regents' counts or an educational equivalent acceptable to said regents." In "Handbook 11" issued by the education department of the State of New York, are given "law, rules and information" on the subject of pharmaceutical education. Under "Preliminary educational requirements" in this handbook there appeared then and remains still unchanged this rule: "The pharmacy student certificate issued by the department must be filed with the executive officer of the pharmacy school not later than December 31 of the year in which he enters on his first course."

These two quotations, we believe, cover the point raised by our present querist.

Sanford's Catarrh Remedy.—W. C. F., Texas.—Oleson's Secret Nostrums and Systems of Medicine (1894 edition) has the following to say concerning "Sanford's radical cure for catarrh":

Consists, according to an analysis made by Prof. A. B. Lyons, of a distilled extract of witchhazel, containing a little alcohol and glycerin, perhaps as much as 5 per cent. of the latter, and between 10 and 15 per cent. of the former (no exact determinations attempted), also an important constituent, morphine—quantity not estimated.

The "solvent" consists mostly of niter [potassium nitrate?] and bicarbonate of soda, with a small quantity of the yellow powder, insoluble or sparingly soluble in water—probably a vegetable powder.

In the Circular of Information to the Drug Trade distributed by the Indiana Board of Health in 1908 "Sanford's radical [sic] cure for catarrh" is reported to contain 10 per cent. of alcohol. As this circular was designed to tell the content of opiates as well as the alcoholic content, it would seem that the nostrum referred to did not contain any morphine. Because of pure drug and anti-narcotic laws many nostrum formulas have been subjected to a denarcotizing process during the past five years, as a result of which the drug world knows many of them no more: narcoticless "catarrh cures" are poor sellers.

Gold Dust.—O. D., New York.—We do not know the composition of this soap powder, but have seen it stated that it contains—

Water	8 parts.
Anhydrous sodium carbonate.....	49 parts.
Soap	43 parts.

Total 100 parts.

We are under the impression that all preparations of this class consist largely of powdered soap fortified by strong alkalies. A few recipes which may be of interest to you are here given:

Borax Soap Powder.

Soap	5 pounds.
Sodium hydroxide.....	3 pounds.
Sodium silicate.....	2 pounds.
Sodium borate.....	1 pound.

London Soap Powder.

Soap	6 pounds.
Sodium hydroxide.....	2 pounds.
Pearlash	1 pound.
Sodium sulphate.....	1 pound.

Chemical Soap Powder.

Equal parts of soap, sodium hydroxide and sodium borate, perfumed with oil of eucalyptus.

Dry Soap Powder.

Desiccated hard soap.....	28 parts.
Sodium carbonate (crystals).....	68 parts.
Anhydrous boric acid.....	1 part.
Boron nitride.....	1 part.
Ammonium chloride.....	1 part.

Other formulas may be seen in the issues of the CIRCULAR for last January, page 30, and for March, 1907, page 270.

Flavor for Syrup of Codeine.—A. B. C., Connecticut.—In the CIRCULAR for May, 1907, page 364, appears a formula for a syrup of codeine containing the phosphate of the alkaloid in a flavored vehicle. The vehicle is one with which we have had considerable practical experience, and one that pleased us and our physician friends. It is constituted as follows:

Syrup of orange flower U. S. P.	2 parts.
Syrup of raspberry U. S. P., 1890.	1 part.

In attempting to improve official preparations pharmacists should not lose sight of the fact that the federal food and drugs act and the statutes of a number of the States have provisions that apply in cases where officially named preparations are not of exact official composition.

Another oftentimes overlooked fact that we are led to mention again is that a great deal of time will be saved if a druggist will preserve his copies of the CIRCULAR so that he may consult them himself and not have to wait a month or more until somebody in this office does the consulting and the information is reprinted. We are glad to do this, but dislike to keep the querist waiting.

Paint and Varnish Removers.—J. W. Dempsey, New York, referring to the note on this subject in the CIRCULAR for July, page 355, writes that a saturated solution of sodium bicarbonate is a simple and sure paint and varnish remover. He says this is to be applied freely, when, after a few minutes, the paint or varnish may be washed off. The wood is to be thor-

oughly cleaned afterward. The same process will remove gold leaf from glass.

Mr. Dempsey adds that he hopes his note will prove useful, as he has found much of value to him in the CIRCULAR. We feel sure that it will, and thank him not only for the note itself but for his spirit of reciprocity, which we trust will be caught by all who have any ideas worth communicating.

Most of the formulas given in our note called for a strong alkali, and it is to this ingredient that the preparations made according to these formulas owe their property of dissolving the paint or varnish. The washing after the use of the remover is to prevent any of it from coming into contact with the new coat of paint or varnish, and removing that also. Vinegar or other acid applied after the removal of the paint or varnish will tend to neutralize any of the alkali left on or in the wood.

Persian or Dalmatian Insect Powder?—I. E. B., New York, inquires: "Which is the better insecticide for roaches, Dalmatian or Persian insect powder, and where can I obtain in quantity for the best price?"

Dr. A. B. Lyons (in Plant Names) is authority for the statement that the Dalmatian insect powder, made from flowers of *chrysanthemum cinerariæfolium*, is much inferior in activity to the Persian insect powder from *chrysanthemum carneum* Weber, or *chrysanthemum roseum* Weber. On the other hand, the United States Dispensatory states that the Dalmatian powder is "more powerful" than the Persian. A "very superior variety," it adds, is the Montenegrin, made from *chrysanthemum cinerariæfolium* growing wild in Montenegro. The superiority of the Dalmatian powder is believed in by George M. Beringer, who, in a paper read at the pharmaceutical meeting of the Philadelphia College of Pharmacy, in December, 1888, and printed in the *American Journal of Pharmacy* for January, 1889, page 1, says: "The Dalmatian insect powder has proven so superior to the Persian powder, that it has driven the latter out of the market."

Drug importers and brokers are the people from whom to obtain the flowers or powder in quantities at lowest prices. Of these there are many in this city, as will be seen by consulting a business directory. We feel that we should not name any one or two concerns to the exclusion of others.

Recipes for Family Medicines.—G. M., Illinois, requests a "good formula for a liquid cathartic for children and infants," and a formula "for use in stomach troubles, indigestion, dyspepsia, etc., powder or liquid."

We are sorry to have to refuse a request made in good faith by an old friend, but we believe that it is best for pharmacists to leave the selection of remedies for the ills of humanity to those who are qualified by special preparation and are licensed by law to make such selection. Those who undertake to prescribe medicines when they have not prepared themselves by special study for the rôle they assume, thereby place themselves in the class with quacks, and we feel sure that no conscientious pharmacist who gives the matter due thought will voluntarily enter that class. Let physicians prescribe and pharmacists dispense.

To Remove Superfluous Hair.—J. W. P., Missouri.—Chemical depilatories of the less harmful variety owe their virtue chiefly to a sulphide, barium sulphide being the favorite; but strontium sulphide is probably less poisonous. Those who are in a position to speak with authority say that the use of a chemical depilatory has no real advantage over the mechanical removal of superfluous hair by shaving. Perhaps there is a psychological advantage in the fact that chemical depilating is not generally believed to hasten the growth of the hair.

A typical formula for a barium sulphide depilatory is:

Barium sulphide.....	5 parts.
Powdered soap.....	1 part.
Powdered talc.....	7 parts.
Corn starch.....	7 parts.

For use, a teaspoonful of the powder is made into a paste with 3 teaspoonfuls of water, and applied in a moderately thick even layer with a lathering brush. After four or five minutes the paste is moistened with a wet sponge and after another five minutes it is washed off, the hair being removed with it.

A German depilatory which, it is said—with what authority we do not know—does not irritate the skin as does the ordinary sulphide preparation is made as follows:

Strontium sulphide.....	3 parts.
Starch	4 parts.
Water	16 parts.

Triturate the sulphide with the starch; add the water and stir well; when a smooth mixture is obtained heat it to the boiling point with constant stirring.

The liquid depilatories are usually saturated solutions of sodium monosulphide in freshly prepared lime water.

The use of a chemical depilatory by inexperienced or careless persons is sometimes followed by disturbing, untoward results. The pharmacist should assure himself that purchasers of preparations of this class are familiar with their application, and should warn them that he will not be responsible for any ill effects resulting from their use.

Freckle Cure.—L. W. H., South Carolina.—We know of no "cure" for freckles and doubt whether there is one. There are lotions which are said to remove the little brown spots from the skin, but some of these contain corrosive mercuric chloride or other active poison, and all, perhaps, do the skin more harm than good. Buttermilk, horseradish, lemon juice and other household remedies for the complaint are not unknown, and solution of hydrogen dioxide, about 10 per cent., in rose water to which a little glycerin has been added, has been recommended as a freckle lotion. As to the effectiveness of these applications, however, we are not in a position to speak with authority.

Coloring Petrolatum Green.—I. B. C., Minnesota.—As you have effectually concealed from us the purpose for which the green petrolatum is to be used, we might give you a process for producing the color which would unfit your petrolatum for that purpose. Chlorophyll is a harmless green color, and a good source of it for use in coloring petrolatum is crushed hemp seed, which may be digested in the oil. Maybe

a color so produced would not be bright enough for you. Any shade can be given to petrolatum with the "fat-colors" or oil-soluble anilin dyes, used singly or in combinations. First, get a dye of the required color: dissolve some of it in some melted petrolatum, and dilute the batch to the desired shade. However, some of the anilin dyes would render the petrolatum unfit for certain medicinal uses.

Formula for Making Chewing Gum.—E. S., Illinois.—Contrary to what seems to be a widely prevalent idea, the formula for making many preparations is of secondary importance, the prime consideration in such case as we now have in mind being the factory equipment and the ability, born of experience, to use it. An inexperienced man who has not the proper machinery can hardly expect to compete successfully with established concerns in the manufacture of chewing gum. As a suggestion, however, to those who wish to experiment, a formula is here given:

Gum chicle.....	122 parts.
Paraffin	42 parts.
Balsam of tolu.....	4 parts.
Sugar	384 parts.
Water	48 parts.

Dissolve the sugar in the water by the aid of gentle heat and pour the mass on an oiled slab. Melt the gum, balsam and paraffin together and pour on top of the syrup and work the whole together.

Other notes on this subject, with formulas, may be seen in the issues of the CIRCULAR for last February, page 83; June, 1907, page 416; September, 1905, page 317; December, 1905, page 434; June, 1904, page 133; and in still earlier issues.

To Determine the Absence of "Hypo."—L. G. P., Florida.—Sodium thiosulphate, generally spoken of as "hypo," has the property of bleaching solutions of a number of substances including iodine and potassium permanganate. This fact is taken advantage of in determining when a photographic negative or print has been sufficiently washed after fixing. Two of the reagents used for this purpose are given herewith.

I.

Potassium permanganate.....	3 grains.
Sodium hydroxide.....	15 grains.
Distilled water.....	1 pint.

Make a solution.

To 2 ounces of the water last used to wash the negative or print add about 5 drops of the permanganate solution. If there is any hypo present the pinkish coloration will soon change to a pale-green.

II.

Boil a pinch of starch in 3 ounces of distilled water. When cool add a few drops of a 5 per cent. alcoholic solution of iodine.

A drop or two of this liquid added to half a pint of the washing water will immediately be decolorized if the latter contains any sodium thiosulphate.

Zinc Chloride Mouth Wash.—W. K., Louisiana.—When you wrote your query you had not received the August number of the CIRCULAR, on page 417 of which is the information you desire, published at the request of another subscriber.

Code Prescriptions.—"Young Brother," Quebec, writes:

I receive every day code prescriptions as Dr. Diekman calls them in his article on ethical prescriptions in the last number of the CIRCULAR ["The Ethical Consideration of the Prescription" in the July CIRCULAR, page 345]. I should like to have some good suggestions to make the bearers of these prescriptions understand that it is not because of a lack of knowledge that I do not fill the prescriptions.

I think it would be my right to point out to my customers the connection existing between the doctors who write the code prescriptions and the druggists who can fill them but hesitate about making such a direct statement.

Any consideration we might give to the momentous subject brought up by our Canadian friend would at best be little other than academic, and the academic consideration of the subject has been as abundant as it has been futile. The matter is one which has as many phases as it has recurrences; and each recurrence has so much of the personal element in it that a general or panacean treatment is out of the question.

There will be occasions when a little missionary work with the physician will enable him to see his departure from the straight way of his profession. In other instances much can be accomplished by a campaign of education, for patient and prescriber, carried on through contributions to the public press. This is perhaps the most effective plan. There is nothing so potent toward remedying an evil as is aroused public sentiment. These contributions must be adjusted to the nature of the practice against which they are aimed. They should be kept free from unnecessary acerbity and should hold no hint of mercenariness. Reprints of the newspaper articles should be kept in the store and placed in the hands of every bearer of a code prescription with an appropriate explanatory remark.

Another channel of redress that is open to the pharmacist in many instances is in an appeal to the medical societies. Most of these have a code of ethics which includes a clause antagonistic to code prescriptions. Of course all writers of such orders are not members of medical societies, but it is often possible for the deserving druggist to enlist the aid of a society in shedding the light of publicity on the undesirable features of the practice.

Proper Proportion of Soap in a Tooth Wash.—C. J. L., California.—Relative to the cause and prevention of precipitation in saponaceous tooth washes Paul Caldwell, writing in the CIRCULAR for May, 1906, page 159, said:

Personal experience has taught me that by placing the saponaceous tooth wash on ice and afterward filtering, any excess of soap is removed and no further precipitate occurs. It might be well to add that the formula upon which this statement is based directs 55 per cent. of alcohol, and in a 48-gallon lot it was found that 4 pounds of soap was all that was retained in solution.

In the CIRCULAR for April, 1907, page 293, Mr. Caldwell describes his method of filtering tooth washes, etc., at a low temperature. The solubility of soap in diluted alcohol is diminished by the presence of an animal fat, pure olive oil soap being much more soluble than the so-called "white" soaps.

A typical formula for a good saponaceous tooth wash appears in the CIRCULAR for December, 1910, page 635.

Rose Water, Glycerin and Tincture of Benzoin.—R. H. W., North Dakota, is puzzled how to compound into a creamy lotion, without a sticky precipitate, the following:

Glycerin	1 ounce.
Tincture of benzoin.....	1½ drams.
Rose water.....	enough to make 4 ounces.

R. H. W. has had the most success with mixing the rose water and the glycerin in a bottle, pouring the tincture on top of the mixture, corking the bottle and slowly inverting it a few times. It was not quite in that way that we, in our days behind the mirrored screen, compounded the popular cosmetic, rose water and glycerin with benzoin. But, in the first place, we used the following proportions.

Tincture of benzoin.....	½ ounce.
Glycerin	8 ounces.
Rose water.....	7½ ounces.

Then we, having mixed the glycerin and the rose water thoroughly, added the tincture a little at a time, inverting the container gently after each addition. Even so, a small amount of a curdy precipitate would usually be formed, but the lotion was freed from this when dispensed. We fancy that this method would be satisfactory in our querist's case.

At the 1907 meeting of the American Pharmaceutical Association F. M. Apple described a method of combining the three ingredients under consideration into a smooth creamy mixture. His method, which is given in the Proceedings for that year, page 132, consists essentially in mixing the tincture with one-half of the glycerin—the proportions are practically the same as those given in the second formula herein—diluting this with about half the rose water, and adding the mixture of the remaining glycerin and rose water. The mixture is immediately strained through a fine-meshed straining cloth three or four times, the curd being rubbed through with a glass rod, transferred to a suitable container and thoroughly shaken.

Mothersill's Seasick Remedy.—E. B. P., New Jersey.—According to an analysis made in the laboratories of the American Medical Association, the pink capsule contains—

Chlorbutanol	46.1 per cent.
Caffeine	7.9 per cent.
Milk sugar.....	27.0 per cent.
Fatty acid.....	18.2 per cent.
Undetermined	0.8 per cent.

The brown powder was found to contain practically the same substances, except that instead of milk sugar, powdered cinnamon was a constituent.

Chlorbutanol has been used with more or less success in the treatment of mal de mer.

Free Carbon Dioxide in Tooth Pastes.—In a note to the CIRCULAR Paul Caldwell calls attention to the fact that carbon dioxide frequently is liberated in tooth pastes of which a carbonate is a constituent, and says that before such a paste is placed in tubes this gas should be driven off by heating.

Universal Balm.—G. F. D., Massachusetts.—We do not know the composition of this preparation. We ask the aid of anyone who is in a position to give it.

Waterproofed Portland Cement.—A. M. D., Massachusetts.—The method of using the substance, to which we take it you refer, to render Portland cement waterproof was patented April 23d, 1907. The following quotation from the specification of the letters patent contains the information you seek:

The invention is in part a process of rendering cement waterproof, which consists in mixing therewith a small percentage of an insoluble lime salt of a fatty acid, preferably stearate of lime, substantially free from glycerin or other soluble substance.

We believe that mixtures of calcium sulphate and a soluble sulphate or soluble silicate are used for a similar purpose. To what extent these are covered by letters patent we have not ascertained. A similar process which we have seen described consists in adding 1 per cent. of powdered alum to the mixed cement and sand, and using 1 per cent. of common yellow soap in the mixing water.

Practical men tell us that the admixture of something with the cement is not so satisfactory in producing a waterproof structure as is the use of a filler and paint upon the surface of the cement work. One process described to us consists in brushing over the surface several times with a saturated solution of zinc sulphate and painting over all with a good heavy paint. Solution of sodium silicate is used in the same manner as the zinc sulphate liquid; and experiments have been made with alum and with magnesium sulphate. Here are some formulas of another type:

II.

Rosin	50 pounds.
Heavy varnish	1 gallon.
Benzin	2 gallons.
Boiled linseed oil	1 gallon.
Slaked lime	4 ounces.

Dissolve the rosin in the benzin; add the lime, the oil and then the varnish, stirring well.

Apply with a stiff brush, giving several coats.

In making or using this, the extreme inflammability of benzin should be kept in mind.

I.

Quicklime	1 bushel.
Sodium chloride	8 pounds.
Rice flour	8 pounds.
Whiting	2 pounds.
White glue	2 pounds.
Hot water	enough.

Slake the lime with enough hot water to make a thin paste; add the salt dissolved in a minimum of hot water and the flour made into a thin paste with more hot water; and then add the glue. Mix the whiting with 10 gallons of hot water; stir into the other solution; and set aside for a week.

This mixture is to be heated to boiling when it is to be applied.

Removing Scratches on Plate Glass.—R. E. G., Rhode Island.—Slight scratches may be got rid of by rubbing the scratched surface with a piece of kid leather dipped in a paste made of jewelers' rouge and liquid petrolatum. If the scratches are deep it will be necessary to grind them out and repolish the surface of the glass. To do this the scarred surface is first rubbed down with water and emery flour, using at first a hard wood rubber then a lather-covered one. Very deep scratches may necessitate a pre-

liminary rubbing with sand and pumice. When the scratches have been eliminated, the ground surface is polished with jewelers' rouge or rotten stone and water with a felt or soft leather buffer. The most satisfactory results are obtained with a mechanical rubbing and buffing device.

It is said that slight scratches on a glass surface can be rendered less noticeable by flowing over the surface a solution of spermaceti in ether, letting it dry, and polishing with a piece of silk. An inexperienced user should be cautioned about the inflammability of the liquid.

Oil of Spike.—T. L., New Jersey.—Oil of spike lavender (*lavendula spica*) is known as oil of spike in painting and decorating circles. It is much used as a vehicle for applying pigments in ceramic decorating. Often there is sold as oil of spike *old* oil of turpentine or a mixture of 3 parts of oil of turpentine and 1 part of oil of spike lavender. This mixture may now be called "compound oil of spike" to comply with pure drug laws.

Another and totally different preparation that is named oil of spike is a veterinary liniment constituted somewhat as follows:

I.

Oil of turpentine	2 pints.
Barbadoes tar	1 ounce.
Alkanet root	½ ounce.

Mix the oil and the tar and digest in the mixture for a week the alkanet previously crushed.

II.

Oil of turpentine	8 ounces.
Linseed oil	8 ounces.
Oil of amber	4 ounces.
Oil of juniper	4 ounces.
Crude petroleum	4 ounces.

This preparation is sometimes sold for *British oil*. In some localities crude petroleum is sold as oil of spike.

Veterinary Vermifuge.—L. H. Howard, Missouri, contributes the following formula for a remedy which he says has been successfully used for worms in horses:

Powdered rosin	1 part.
Powdered bloodroot	1 part.
Powdered saltpeter	1 part.

The ingredients are to be intimately mixed; and a tablespoonful is given to the animal every other day, mixed with chopped food.

Doubtless there are many among our readers who will welcome the information given by Mr. Howard and will join with us in an expression of appreciation of his interest in the needs of his fellow practitioners.

Cheap Talc Powder.—G. T. H., Ohio.—Pulverized talc is so cheap, and the little china clay, starch, magnesium carbonate, orris root, boric acid, perfume, etc., added to it to render it an acceptable toilet article add so little to its cost, that it is hard to say how a talc powder cheaper than the ordinary kind can be made, except to direct that the lower-priced ingredients be used, and the more expensive of even these be employed more sparingly than the cheaper ones.

At wholesale crude talc sells for from \$15 a ton for the ordinary American or French, to as high as \$35

a ton for the fancy grades of Italian. By the time it is powdered, it costs the small dealer from 2 cents a pound up to perhaps two or three times that price, according to quality. When purified according to pharmacopœial directions, its cost is, of course, increased, but we believe U. S. P. purified talc is not the kind that is used in the toilet powders.

Liquid Veneer.—H. T. M., Iowa.—In the CIRCULAR for August, 1910, page 429, appears the following note:

A correspondent in the *Pharmaceutical Journal* (London) says that liquid veneer is a furniture polish "nosed" with amyl acetate and loaded with a little putty powder "as a blind." He gives the following as an equivalent formula:

Linseed oil.....	10 parts.
Vinegar	5 parts.
Spirit of salt.....	2 parts.
Amyl acetate.....	enough.
Putty powder [tin oxide].....	enough.

Other formulas for several types of furniture polish appear in the following issues of the present year: June, page 311; May, page 252; and February, page 82.

Parozone Bleach.—H. F. G., Ohio.—Pharmaceutical Formulas is authority for the statement that parozone is a textile bleaching fluid of a type represented by a solution of chlorinated lime from which the lime has been precipitated with alum or magnesium sulphate.

Elixir of Terpin Hydrate.—O. P., Kentucky.—A summary of the more satisfactory suggestions for improving elixir of terpin hydrate appears in the CIRCULAR for March, page 136. Three new formulas are given therein, and there is another in the April issue, page 189.

Greaseless Cold Cream.—W. B. M., Pennsylvania.—A note on this subject appears in the CIRCULAR for last month, page 418, which had not reached you when you wrote. We suggest that you consult the annual indexes to the CIRCULAR for the past four or five years.

Peterman's Discovery for Bed Bugs.—B. R. H., New York.—In the CIRCULAR for March we stated that we did not know the composition of this preparation, but said that kerosene perfumed with oil of sassafras seemed to be about the same thing.

Saratoga Ointment.—F. R. S., Iowa.—We do not know the composition of this preparation. If any one can supply information regarding it, we should be glad to hear from him.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Tracy's Vegetable Healing Balm.—G. A. G., New York.

Tornado—H. S. C., Connecticut.

Asfalath—a perfume.—D. W., Mississippi.—What is it, chemically?

Palmer's Vegetable Lotion.—L. T., Ohio.

Saratoga Ointment.—F. R. S., Iowa.

Universal Balm.—G. F. D., Massachusetts.

Waterproofing Gun Cases.

FOR LEATHER CASES.

a. Gelatin	4 ounces.
Hot water.....	3 pints.
b. Solution of formaldehyde.....	1/2 pint.
Water	2 1/2 pints.

Apply solution *a* hot with a brush, over all the case. When the coating has dried brush over all with solution *b*. Repeat the two operations three times and allow the case to stand exposed to sunlight for several days, turning it about so that the light may act on the entire surface.

FOR CANVAS CASES.

a. Gelatin	5 parts.
Rain water.....	300 parts.
b. Alum	10 parts.
Water	300 parts.
c. Rosin soap.....	5 parts.
Hot water.....	300 parts.

Mix equal portions of *a*, *b* and *c*, and apply with a soft brush.

Thompson's Emulsion of Linseed Oil.

In a recent number of the *Medical Record*, Dr. W. H. Thompson gives the following formula for the emulsion of linseed oil which has become popular among physicians in association with his name:

Linseed oil.....	9 1/2 ounces.
Oil of gaultheria.....	80 minims.
Oil of cinnamon.....	80 minims.
Diluted hydrocyanic acid.....	80 minims.
Glycerin	190 minims.
Syrup	6 1/2 ounces.
Mucilage of irish moss, enough to make	2 pints.

Dr. Thompson says this emulsion can be prepared most satisfactorily in a churn.

Curry Powder.

Coriander	5 pounds.
Turmeric	1 1/2 pounds.
Fenugreek	12 ounces.
Black pepper.....	8 ounces.
Cumin	8 ounces.
Mustard	8 ounces.
Dill	4 ounces.
Pimenta	4 ounces.
African ginger.....	4 ounces.
Table salt.....	1 1/2 ounces.
Capsicum	1 1/4 ounces.

Grind the ingredients together to a fine powder.

Camphor Ice.

Camphor, in coarse powder.....	2 ounces.
Hard paraffin.....	2 ounces.
Glycerin	2 ounces.
White wax.....	5 ounces.
White petrolatum	8 ounces.

The directions, as given in the *British and Colonial Druggist* are: Melt the wax, hard paraffin, and petrolatum together over a water bath, dissolve the camphor in the melted mixture, incorporate the glycerin, and finally pour into moulds.

Indiana Board Questions.

Herewith are reprinted the questions used by the Indiana Board of Pharmacy at its examinations held in January. Other sets of questions asked by this board appear in the issues of the CIRCULAR for January, 1910, page 27, and July, 1908, page 326.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Registered Pharmacist.

Pharmacy.

1. Define specific gravity. Why does the U. S. P. give the specific gravity?
 2. Define rancidity. Can oils, when rancid, be purified? If so, how?
 3. Explain the difference between cerates and ointments, as to consistency and mode of use.
 4. In making a pill mass, what class of drugs would you use petrolatum as an excipient? also soap; syrup. What objection to using syrup of acacia as an excipient?
 5. How much corrosive sublimate in one ounce of a 1-2000 solution? How much water would you add to make it a 1-2500 solution?
 6. If potassium iodide is soluble in .7 its weight of water, how much would be required for a four-ounce saturated solution?
 7. Compound acetanilid powder contains 70% acetanilid, 10% caffeine, 20% soda bi-carb. How much of each required to make two ounces?
 8. What are suppositories? What are bougies? Give the weight of each when oil of theobromo is used as a vehicle. When a substance is used which softens the vehicle, what substance does the U. S. P. allow to be added to raise the melting point? State how you would make a rectal suppository, using oil of theobromo as a base.
 9. If a bottle holds four ounces (Av.) of water and 150 grams of another liquid, what is the sp. gr. of this liquid? What is the weight in grams of four ounces of a liquid sp. gr. 1.25?
 10. If official acetic acid contains 36% of absolute acetic acid, sp. gr. 1.045, how many grams of absolute acid in 500 c. c.?
 11. State the number of grains used in each of the pound weights used in pharmacy? Write in metric system the equivalent of $\frac{1}{4}$ gr., 1 gr., 1 teaspoonful.
 12. Comment on the following prescriptions:
- | | |
|----------------------------------|----------|
| R Hyg Chlor | gr. v |

Chemistry, Posology and Toxicology.

1. What is an element? An atom? A molecule? Name and give symbols of ten elements. Elements are of two kinds. Name and describe two of each kind.
2. Name and describe ten chemical salts with which you are familiar, physical appearance, solubility, toxicity, formula, whether normal, acid or double salt, average dose and if poisonous name recognized antidote.
3. Syrup of Iodide of Iron contains 3.84 grs. of Ferrous Iodide per fluidrachm, how much Iodine will be required to make one pint of the syrup? (Fe=56, I=26.) Is the using of an excess of Iron permissible in making this? If not, why?
4. How could you distinguish HgCl₂ from HgCl? Give pharmacopoeal name of each. Is either a poison? If so, name it and describe it as to physical appearance, solubility in alcohol and water, average dose, character of its poisonous action and antidote.
5. Hydrocyanic Acid is made by the reaction between Silver Cyanide and Hydrochloric Acid. Why is Hydrochloric Acid used in preference to other acids? What is the tendency in all chemical reactions?

6. Complete the following equations; also write the entire equations in ordinary terms: $\text{ZnSO}_4 + \text{Pb} (\text{C}_2\text{H}_3\text{O}_2)_2 =$ $\text{Na}_2\text{CO}_3 + \text{FeSO}_4 =$ $\text{AgNO}_3 + \text{NaCl} =$
 $2\text{KI} + \text{H}_2\text{C}_4\text{H}_4\text{O}_6 =$

7. Liquor Calcis. Give common name. What salt of Calcium is directed to be used in making it? To what salt does it change when it comes in contact with the water? Give formula of that newly formed salt. Why does Liquor Calcis, when exposed to the air, throw down a precipitate? What is that precipitate? Show by equation the reaction.

8. The formula of Ferrous Sulphate is usually written FeSO₄. What does the Pharmacopoea mean by giving it as FeSO₄ + 7H₂O? How could you get rid of that 7H₂O? Tell the physical appearance of Ferrous Sulphate both before and after loss of the 7H₂O. What is the pharmacopoeal name of the changed salt.

9. Outline your favorite test for detecting albumen in urine. Also for sugar in urine.

10. Give the recognized average dose of each of the following: Morphine Sulphate, Atropine Sulphate, Strychnine Sulphate and Arsenic Trioxide. Select any two of these, name best antidotes and tell how to proceed, in case of an emergency, and before the arrival of a physician.

Materia Medica.

A Credit of 1 to 5 per cent. will be allowed for neatness and legibility of manuscript.

1. Define Botany, Pharmacognosy, Posology, Toxicology and Ecology.
2. Give family, habitat and parts used of Eucalyptus. Average dose of same.
3. What is a plant. Into what three general classes are they divided. Which division is most important to Materia Medica. Give reason for your answer.
4. Write in your own language, and not to exceed 100 words, an account of Mercury, as to source, official preparations, doses and medicinal uses.
5. What Alkaloids are obtained from Coffee, Tea and Cocoa. Give medicinal uses and doses of same.
6. Give official name, family habitat and medicinal properties of Burdock.
7. What is Ergot. What is its medicinal uses. What are its active constituents.
8. What is the source of Plumbi. What forms are official, giving their medicinal use, and when given internally, their dose.
9. What is Lycopodium, and what is its principal use. Same of Adeps Lanae Hydrous.
10. Give official names, medicinal uses and doses of Golden Seal, Dandeline, Poke Root.
11. What are Galenical Preparations. Give two that have alternative properties and their dose.
12. What important products does Thymus Vulgaris yield. Give medicinal use and doses.
13. Give Latin names for Buckthorn, Carbolic Acid, Witchhazel Leaves, Pennyroyal and Logwood.
14. What are the vegetative organs of plants. What are the functions of each.
15. Identify samples submitted.

Assistant Pharmacists.

Pharmacy.

What is specific gravity? What is the weight in grams of 1000 c. c. of glycerine having a sp. gr. of 1.25?

2. What preparation of opium is used in making tr opium? How many grains in four fluid ounces of laudanum?

3. Give the process by which the following are prepared: Prepared chalk; iodine; sulphur.

4. What effect would exposure to the atmosphere have on epsom salts, zinc sulphate, zinc chloride, ext. nux vomica, and iodine?

5. Define solution. Name two kinds of solution. Which is better for making a solution, crystal, powder or granular? Why? What are syrups? When should heat be used in making a syrup. What effect has alcohol on syrup?

6. What is a tincture? In what three official ways are tinctures made? What class of drugs are best adapted for each process? To what class of tinctures is glycerine added?

7. What is precipitation? What is the name of a liquid used to cause it? Give name to liquid remaining after precipitation.

8. For what purpose is a water bath—sand bath—used in pharmacy?

9. Define fusion; calcination; carbonization; sublimation; clarification.

10. If three grams of sodium chloride be dissolved in 27 grams of water, what is the percentage strength of the solution?

11. State the number of grains used in each of the pound weights used in pharmacy. Convert the following into metric system: $\frac{1}{4}$ grain, 1 grain, 1 teaspoonful

12. Comment on the following prescriptions:

R Hyg Chlor gr. v
Aq. menth. pip. q. s. oz. ii

M.
Sig. Take as directed.

R Tr. nucis vom. dr. iii
Acid hydrochloric dil. dr. ii
Pepsin (pure) dr. i
Spt. menth. pip. q. s. oz. iii

M.
Sig. Dr. i t. i. d. as directed.

Chemistry, Toxicology and Posology.

1. What is an element? An atom? A molecule? Name and give symbols of ten elements.

2. Give common names of Iron Sulphate, Zinc Sulphate, Lead Acetate, Liquor Calcis, Tincture Ferric Chloride, Phenol and Potassium Nitrate.

3. Give recognized average doses of Morphine Sulphate, Strychnine Sulphate, Arsenic Trioxide, Phenol. Which of these are not poisonous? Select and describe any one of these, which is poisonous, and name its best antidote.

4. What is meant by the following formulae: H_2O , H_2O_2 , HCl , H_2SO_4 , HNO_3 ?

5. What gas is given off during the effervescence of a mixed Seidlitz Powder? What two chemicals are present to cause this effervescence? What new salt is the result of this reaction? What do you understand by "chemical reaction?" Does heat hasten or retard chemical reaction?

6. Give common names of Hydrargyrum Chloridum Corrosivum and Hydrargyrum Chloridum Mite. Is either a poison? If so, which one? What is the best antidote in case of poisoning with it?

7. What is meant by the terms: acid reaction, alkaline reaction and neutral reaction? How can you tell whether or not a solution is acid, neutral or alkaline in reaction? Name two substances that are acid and two that are alkaline in reaction.

8. Glycerine, Specific Gravity 1.25, is quoted at 28 cents per pound. What will one gallon cost?

9. When exposed to the air Liquor Calcis throws down a precipitate. Why does it and what is the chemical name of that precipitate?

10. Of ten chemical salts with which you are familiar, tell their appearance, average adult dose and whether or not poisonous.

Materia Medica.

A Credit of 1 to 5 per cent. will be allowed for neatness and legibility of manuscript.

1. What is a Solvent. What Solvents are most commonly used. What is the best Solvent for gums.

2. Name two medicines used as Cathartics. Two used as Diuretics. Two used as Astringents. Two used as Cardiac Stimulants.

3. From what source do we obtain Aloin. Describe it, giving its medicinal use, and average dose.

4. Name five kinds of Roots, giving their medicinal properties and active principals, and average dose of each.

5. From what source do we obtain Santonin, Tannin, Tartaric and Benzoic Acids. Give the principal use of each.

6. Give the official name and medicinal properties of each of the following: Black Cohosh, Poke Root, Lady's Slipper, Dog Wood, Passion Flower, Dandelion and Mari-gold.

7. As applied to plant life define the terms: Annual, Perennial, Biennial. Give the name of a plant occurring in each.

8. From what source do we obtain Plumbi Acetate. What is its action and use. Give the average dose.

9. From what source do we obtain Adeps Lanae Hydrous. What is its principal use.

10. Give Latin names for White Oak Bark, Flax Seed and Sugar of Milk.

11. What is the source of Sodium Benzoate. What is its action and principal use. Give average dose.

12. Identify samples submitted.

The applicants were also given tests in identifying specimens and in practical work.

Tinting Photographic Prints.

Kieser (*Photo. Indust.* through *Chem. Drug.*) reports some results obtained in experimenting with the dyeing of photographic papers. The dyes which he has found most suitable are alizarin saphirol, for soft blue tone; naphthol green B, for soft green; chloromin brown G, for brownish tones; permanent bordeaux B, for purplish tones; brilliant crocein 3 B, for yellowish-red; and permanent light-yellow 3 G, for yellow. The dyes are kept in 1 per cent. stock solutions, and when required for use are diluted in the proportion of 1 in 10,000 parts of water. The well-washed bromide or gaslight prints are placed in the dye-bath and allowed to soak until the required depth of tint is obtained. The tint darkens somewhat on drying. The author notes that mixtures of the two dyes last named above give a fiery-red tone suitable for firelight effects.

Reducing Bromide Photographic Prints.

Lambert (*Photo. Scraps*) suggests the use of potassium alum and potassium permanganate as reducing agents for prints on bromide paper. He uses a saturated solution of alum given a pale-pink tint with solution of potassium permanganate. The prints are soaked in water for five minutes before immersion in the reducing bath; and they are left in the latter for about ten minutes. Any stain is removed by a very weak solution of oxalic acid or potassium metasulphite.

Disguised Castor Oil.

Oppler gives castor oil in an electuary made as follows:

Finely powdered roasted coffee... 10 grammes.
Powdered sugar..... 20 grammes.
Castor oil..... 20 grammes.

The following formula for aromatized castor oil is credited to the *Medical Fortnightly*:

Saccharin 15 grains.
Sodium bicarbonate..... 15 grains.
Chloroform 5 drams.
Oil of pimenta..... $2\frac{1}{2}$ drams.
Oil of cassia..... $2\frac{1}{2}$ drams.
Oil of cloves..... $2\frac{1}{2}$ drams.
Castor oil..... 5 pints.

Dissolve the saccharin in the chloroform; add the sodium bicarbonate; then add the oils, which have been previously mixed, and shake vigorously.

Chilblain Collodion.

Euresol 1 dram.
Eucalyptol 1 dram.
Oil of turpentine..... 1 dram.
Collodion..... enough to make 10 drams.

This application should not be used if the skin is broken.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Country Drug Life not so Discouraging.

Hartford, Conn., July 27th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

If you do not consider it an intrusion, I should like to offer a word of counsel to Mr. Samuel H. Fritz and others who may be getting discouraged.

They should not think that, because they know a whole lot about the drug business, the "Rubes" are going to believe it; it must be proven. The transported city drug clerk must stick and show the townspeople that he knows the drug business. Then, instead of sending their prescriptions out of town, they will come to him, and he will have a chance to see some drug business. His daily life, too, has a great deal of weight; he is watched more closely than in the city.

I had three years of country experience. The first year the patrons of the store were almost afraid to let me give them a dose of castor oil; and, when my employer took a two-weeks' vacation, the business fell off. But from that time on, the people began to have confidence in me. To-day, if any of those "Rubes" come to town, they always look me up.

Many of the "Rubes" can take the city-bred clerk out in the backlots and teach him more practical botany than he ever learned at college.

"Me for" the small country town if I get a chance. There is more real drug business and real appreciation of your skill there than anywhere else. Your drug business depends on yourself.

D. N. CALLENDER.

Dispensing by Physicians a Drawback to "Rural" Pharmacy.

Still at Schenectady, July 27th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

For many reasons, the chief ones being that I wanted to be away from the intense heat of the city and to recuperate, I have remained in this vicinity. In my previous letter to the CIRCULAR [July number, page 371] I forgot to mention that the great majority of the doctors in this town are of the dispensing variety; and it is their influence and also much on the part of the rapidly and ever increasing new patent [?] medicine men that tend to make pharmacy what it should not be.

Of course we should have some commercialism about us; but why not a little more professionalism?

One day I conceived the idea that, if the public could be informed that the doctor who dispensed—unless he is a pharmacist as well as a physician—is dealing with an extremely serious issue of which he knew very little, quite some good would be accomplished. So I contributed a note on the subject to a local paper; and I intend to contribute more. I sincerely hope that my pharmaceutical friends will take up a part of the work against this great evil, the dispens-

ing by physicians. What do you think of this matter? I will admit that there are quite a few ways of overcoming this sad state of affairs; and in my opinion the newspaper is an excellent medium, especially when one writes the truth; for, after all, the pen is mightier than the sword. SAMUEL H. FRITZ.

[As we have frequently stated, it is our opinion that the physician empowered by the State to select the medicine indicated by his diagnosis of the patient's condition has every right to provide that medicine for the patient's use. The problem is after all a medical one that does not adapt itself to a pharmacological solution. But pharmacists have an opportunity to effect the enactment of legislation that will assure the record of the kind, quality and amount of each drug furnished to any patient by a dispensing physician. In this endeavor public opinion would well be enlisted and there is a promise of assistance from the leading medical organizations if the resolution by the American Medical Association appearing in our news pages this month is any indication of the trend of medical opinion.—Editor THE DRUGGISTS CIRCULAR.]

Druggists and the Sabbath.

New Jersey, July 20th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

It is my Sunday "on," as I write. It is with contempt for myself and shame for my profession that these lines are penned. The day has been a beautiful Sunday—so cool and refreshing after the hot days preceding.

Strewn along the pathway of the hours that have come and gone so quickly to-day were countless opportunities for refreshment of body and mind and soul. I have gathered nothing; for I have been shut in all day. What a pity! The church bells rang out their welcome—but I could not seek that divine inspiration which would help to make me a better, nobler man. The woods called in their enticing way—but I must turn a deaf ear. My wife and children, in silence, pleaded that I come—but I could not. Must I lose my love of God?

Must I gradually grow deaf to the call to enjoy nature's beauties?

Must I become callous to the tender pleadings of wife and little ones?

Must I lose sentiment and delight in things that are holy and pure and beautiful?

Does the drug business mean that?

What a pity to be a vendor of post cards, candies, "patent" medicines, etc., etc., on Sunday! What a pity to accept a few shekels in place of a beautiful day spent either in communion with God, or in the woods breathing in the fragrance of the pine, or at home with wife and children!

I saw my father pass into an early grave. Our home hardly knew his presence. He was a stranger. He was always at the store. He came home after we had retired and left before we were up. He never tasted the joys of life that count. He never had time for a hobby. He became a mere machine.

There is no excuse for the drug store being open all day Sunday. We all know it. We know that our business does not have to be run seven days of the week instead of six, like other retail shops. We know that we are not open for business all day just because we love humanity. We are after the dollars.

Is it not a shame and really a disgrace to pharmacy to make it a party to the commercialization of Sunday? The pharmacist, as a professional man, ought to stand for the highest and best in the community and it ought to be a point of honor with him to set the example by rigid compliance with all laws both civic and moral. The fact that the people clamor for soda, cigars and candy from the drug store, of course offers no justification for the pharmacist to bend to their pleasure, even though the financial reward is very tempting. That financial reward fails to tempt countless thousands of merchants in other lines of business is well evidenced by their almost universal custom of closing their shops on Sunday. It is a curious fact that of all professional or business men, the pharmacist makes the least effort to shorten his working day, and in but comparatively few instances makes his Sunday business in no way different from his daily routine.

Countless centuries of practice have taught the value and wisdom of the seventh day rest. A man need not be religious to appreciate that fact. Greater men than I, by far, have prophesied the ultimate value to pharmacy of the adoption of the seventh day rest. It seems incredible that it has not been adopted long ago. It is not Utopian. It is not the scheme of a fanatic; it is the goal longed for by thousands of thoughtful men.

I have not meant to criticise men, but to condemn a system; a system wrong in principle, pernicious in its effects and not justified in any form. The great mass of men who keep open Sunday are simply victims of the system. They are eager to be unbound; but ask in unison, "How are you going to do it?" That is the problem. It is up to the men of thought and influence to solve it. It will be solved.

SUNDAY REST.

[This is an old subject which has been threshed over time and time again, but it is an important one and our present correspondent has set forth his views on it in a unique and rather striking manner. We should hail with delight the advent of the time when pharmacists can make their livings like other men in six days in the week and eight to ten hours in the day. —Editor THE DRUGGISTS CIRCULAR.]

Floor Polishes.

FOR DARK-COLORED WOODS.

Stearin	100 parts.
Yellow wax.....	25 parts.
Potassium hydroxide.....	60 parts.
Yellow soap.....	10 parts.
Water	60 parts.

Dissolve the potassium hydroxide in one-half the water; heat the stearin with this lye until saponification is complete, and add the wax. Dissolve the soap in the rest of the water; mix the two solutions.

FOR LIGHT-COLORED WOODS.

White wax.....	75 parts.
Bleached shellac.....	75 parts.
Pale rosin.....	6 parts.
Oil of turpentine.....	100 parts.
Alcohol	400 parts.

Melt the wax, shellac, and rosin together; remove from the source of heat and add the oil and the spirit previously warmed.

Views of Professors and Practitioners on Graduation and Licensure.

Last February the Pennsylvania Board of Pharmacy examined a class of fifty-six candidates for licensure as pharmacists, all graduates of "recognized" colleges of pharmacy. Only thirteen of them passed. The same month only fifteen out of a class of perhaps some forty-odd graduates of colleges of pharmacy were able to secure licenses as pharmacists from the New York board. In commenting on these facts, the CIRCULAR said (May, page 239): "There is something wrong somewhere, and we pharmacists ourselves should find out what the trouble is and remedy it without waiting for some 'yeller' or 'muck-raker' in the lay press to lampoon, cartoon, excoriate and humiliate us for our shams, shortcomings or inconsistencies." As a result of this comment there appeared in the CIRCULAR for June, page 314, a letter from Louis Emanuel, president of the Pennsylvania Board of Pharmacy, and in the July issue, page 360, is another communication from Mr. Emanuel, accompanied by the set of questions used by his board at its February examination, and the answers to the same given by three candidates, respectively, graduates of three of the leading colleges of pharmacy in that State, who had failed.

Last month, on page 425, were published letters on this subject from Profs. Joseph P. Remington, Oscar Oldberg and E. F. Ladd, and editorial comment on the subject was made in July and August. Several other letters from prominent pharmaceutical educators were received too late for publication in the August issue, and these are herewith given. The first is from an experienced teacher who has consecrated his life to the task of bettering educational conditions in pharmacy. While he deprecates many things in connection with the present agitation, he agrees in the main with the view taken by the CIRCULAR as to the necessity for improvement of certain conditions pointed out. His letter follows:

Should Be Ashamed of Our Small Accomplishment in Pharmaceutical Education.

Madison, Wis., July 21st, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I trust that some good may come from this exposé by the "muckraker from Muckrakersville," as the author* of "College Graduates before the Board" styles himself. But why is the title so sweeping? Why not "The Lamentable Story of Three College Graduates before the Pennsylvania Board of Pharmacy"?

We have had muckraking in politics, in municipal administrations and elsewhere. Now we are to be treated to a dose of it in pharmaceutical education. Possibly I am nothing if not critical, but I draw the line at muckraking or yellow journalism. I know something as to the falsehoods concerning the insinuations about the "manufacturer who mixes spoiled tomatoes, sodium benzoate, anilin dye and a few other things and labels the product 'Pure Tomato Catsup'" that have so readily found their way into "reputable" magazines. I fear that some of your inferences concerning the college graduate are somewhat on a par with those drawn from the use of benzoic acid.

There is a perfectly legitimate use of benzoic acid, and there is a use made of benzoic acid that we condemn.

*Louis Emanuel, president of the Pennsylvania Board of Pharmacy.

†It was really a story of forty-three college graduates who failed, out of fifty-six who took the examination—see the CIRCULAR for June, page 324.—Editor THE DRUGGISTS CIRCULAR.

There are good college graduates, there are indifferent ones, and even poor ones, and always will be. The pharmaceutical graduate is no exception to this rule. The secret and illegitimate use of benzoic acid we condemn, but this is no reason for railing at its proper use or denouncing as scoundrels those who believe in its legitimate and honest use. The poor pharmaceutical graduate should not be passed by the State boards of pharmacy, but again this is no reason for denouncing the pharmaceutical graduates as a class.

God only seems to have known all these years how poor an excuse our pharmaceutical curricula have been, but they are pretty much what the druggists as a whole, and those druggists in particular, who now for more than a quarter of a century have been examining candidates, have made them. More than any other group of men, our members of State boards of pharmacy are responsible for cramming schools and for the lowering of standards on the part of schools that have striven to rise above the plane of those institutions who have made it their mission to "prepare" for State board examinations. There are notable exceptions among these board members, but just enough to prove the rule.

When we, who have been trying to educate the pharmaceutical apprentice sent us by the druggist, complained that he did not even possess the elementary training of a grammar school, those colleges which are controlled by druggists objected to the enforcement of a rule requiring one year of high school. Likewise did the druggists at large who feared that their supply of cheap apprentices might be cut off. In order properly to educate pharmacists we need not only one year of high school, we need graduation from high school, we need more than that.

You state editorially that graduates have failed to answer questions "which any intelligent boy who has been working as a messenger or porter in a drug store for twelve months ought to be able to dispose of as a matter of course by putting to use his mother wit and the information he has absorbed by contact with drugs and druggists." If the average druggist of this country is so poor a business man that the N. W. D. A. feels constrained to appeal to the colleges of pharmacy to teach young men, who have served an apprenticeship of several years, how to write simple forms of business papers, how much arithmetic, not to mention chemistry and pharmacy, may such an apprentice be expected to absorb "by contact with" such a preceptor? If he does not "absorb" more from his teacher at college, is it not often true that he has no use for what his college professor tries to teach him for the very reason that his preceptor has told him that such "theoretical stuff" is all nonsense; or because he was given to understand that he could pass the board without it? It is in this indirect manner that the druggists at large have aided in making the college what it is.

Just a word as to the examination questions printed with their answers in your July issue. The truth of the adage that it is easier to criticize than to do better, we who have been trying to elevate pharmaceutical education have experienced in ourselves again and again. Charity therefore demands that we be slow in criticising the State board of pharmacy. But just as the average college professor would make a poor druggist behind the counter, so the average member of the board of pharmacy is of necessity a poor examiner. It should possibly be explained that it is to the credit of the average board member that the boards have not done worse. Yet when one reads the questions of the examinations submitted, one is involuntarily reminded of the German adage, "Es wird mir bei alledem so dumm als ging mir ein Muehlrad in Kopf herum." As to the "practical" part of the examination, accident would have it that a year ago I visited one of the laboratories in which one of these "practical" examinations of the board in question had been conducted a few days previously. The entire "system" was explained to me by a well qualified person. If before that time I had often questioned the wisdom of judging by examination, I was on that day sorely inclined to condemn unqualifiedly the whole miserable system.

As a critic of our own system, or rather lack of system, of pharmaceutical education, I have many a time pointed out the shortcomings of our colleges and schools. Fortunately, I have been so situated that my salary was not measured, at least not directly, by the number of students I had. Avoiding educational suicide, I have tried to raise the standard of the course over which I preside just as rapidly as possible. In your editorial you point out, and

rightly, that the graduates who failed to pass the examination lacked in capacity to think. Yet the teacher who endeavors to cause his students to think rather than to commit to memory a lot of heterogeneous information, is severely criticised by druggists, and above all by those druggists who were or are members of the boards of pharmacy. So great has been the opposition to raising the standard of right thinking, that even a university ex-president once expressed his "admiration" for the optimism I revealed in the attempt to make "students out of those fellows," meaning thereby the insufficiently prepared pharmacy students. A former member of the board of regents criticised my policy because I demanded "too much." As a result our course did not bring enough students to the university and thus swell the total numbers of the institution. Hence my administration was regarded as a partial failure and my salary was kept correspondingly low. Yet I have refused opportunity after opportunity to increase my income, and have been grateful to an administration that permitted me to continue the mission that I have selected for my life work. If members of the boards of pharmacy have been equally sincere, I should like to be informed.

I do not mention these personal matters because I want to place myself above just criticism as a college teacher. I think I have learned to welcome criticism honestly given. Neither do I expect that the best efforts on my part, or any further sacrifices which I may feel called upon to make, will make every pharmaceutical graduate of my institution a successful pharmacist. I do not even expect all of them to pass the State board examinations.

What we need most of all in American pharmacy is an appreciation of the worth of a genuine pharmaceutical education—no 1200 hours of instruction specified in detail or similar preparations to State board examinations—but as thorough, as broad, as liberal an education as can be planned for those who intend to serve the public in sickness and distress while incidentally making an honest living by putting up prescriptions and giving scrupulous attention to similar duties. We have had altogether too much of the dragging down tendency within the college as well as without. If instead of glorifying our modest achievements we learn to feel heartily ashamed of the little we have really accomplished in professional education, possibly some good may come even from this present "muckraking." Taking this optimistic view of the situation, I remain, [etc.]

EDWARD KREMERS.

[Director, Department of Pharmacy,
University of Wisconsin.]

The next letter is from a former dean of a college of pharmacy who has been lured away from teaching and is now chemist for a manufacturing house. It is of interest, although much of it has little if any direct bearing on the main point at issue, namely, the failure of graduates of "recognized" colleges of pharmacy to pass board examinations. It reads:

Why Many College Graduates Fail to Pass State Board Examinations.

Kalamazoo, Mich., July 24th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

The reputable colleges of pharmacy of this country are endeavoring to perform their duty toward the students in attendance. The larger percentage of graduates pass State board examinations and become successful pharmacists. Some fall by the wayside, victims of unfortunate circumstances.

The American Conference of Pharmaceutical Faculties and the national syllabus committee are pruning and squaring up the college courses. The college courses throughout the length and breadth of the land are being shaped to an ideal. It is a process which can not be commended too highly. Its aim is well chosen and the time is not far distant when its object shall be realized in full. These forces plan not only to outline the college course itself, but to set a standard for preliminary education. Many students enter colleges from poor high schools, or with only one year of high school training, and are thus handicapped for life. It is impossible for them to learn as readily in college and often equally difficult for them to retain the knowledge gained.

Many non-college graduates who pass State board examinations, and especially those who have been patrons of six-weeks' quiz courses, study nothing except answers

to State board questions. They fill their minds with a fund of temporary information, sufficient only for the occasion, and as fleeting as time itself. Although such applicants may pass the examination, they fall flat when placed behind prescription counters of the better class of drug stores. Several cases of this kind have come under my immediate observation.

College students often fail to realize the importance of the work given them to do. They learn the lessons for the day only, and fail to retain them many days after an examination in school is over. Other college students constantly review their studies in order to keep the important points concerning the work fresh in mind. Those who *determine* to secure an education when they enter college and continue to nourish that determination until graduation, always win. The other fellow loses. It is simply a matter to be settled by the individual. None are so hard to teach as those who will not learn.

CHARLES H. STOCKING.

[Formerly Dean of the Kansas City College of Pharmacy.]

New Jersey, being flanked on one side by New York and on the other by Pennsylvania, both of which States require college graduation as a prerequisite to board examination, has a deep interest in this question, and has on foot a strong movement to secure a "prerequisite law." These facts lend additional interest to the next letter, which unquestionably points a way out of the trouble, even though a way which all are not prepared to travel just now:

Better Preparatory Schooling and Longer College Courses Needed.

Jersey City, N. J., August 2d, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

There are two reasons why such a large percentage fail in their board of pharmacy examination. In the first place, the average student who attends a college of pharmacy is not in possession of a good education, as he started in a pharmacy as an errand-boy and window and bottle washer. After a time this boy picked up some knowledge of pharmacy about the store and laboratory, sufficient to encourage and render him enthusiastic about attending lectures at a college of pharmacy.

Now, here we have a young man who hardly comprehends what the instructor is talking about; he constantly fails to grasp the essentials of any subject; he cannot properly arrange his lecture notes or thoroughly digest them for the quizzes or even future work; his experience in "how to study" places him at the end of a session in the midst of a "jumble," and he is utterly unable to sort out that which is of intrinsic value, ultimately to make of him the really scientific pharmacist. He soon realizes this and in order to make the best of a bad job resorts to cramming methods and this is usually accomplished by the "quiz compend." He lays aside the text-books because he really can not understand them. His one desire is to accrue just enough to "get through," as they say, and of course many do get through the college in this manner and become "half-baked" pharmacists and remain so for the rest of their lives, all because their ground work was poor.

We certainly want a better educated class of boys as apprentices, and we will then succeed in producing more able and brilliant students for the lecture halls and laboratories.

Pharmacists should therefore apprentice only the high school lad or one who has the something equivalent, and let the other fellow severely alone. If pharmacy is to become an advanced, dignified and honorable profession, then, I say, let us elevate it from the educational standpoint, beginning with the apprentice; if this is done, I am certain there will be no more "kicks coming" about the board of pharmacy failures.

The second reason some fail at the board examination, is that most of our schools of pharmacy have a two-year course. Now I contend that this is too short a time for any instructor, if he desires to be thorough in his work, be it chemistry, pharmacy or materia medica. The field of each is vast, getting more so each year, and therefore I believe that the time has come when we should have a four-year graded course in every college of pharmacy, in-

stead of a two- or three-year course. This would undoubtedly enable competent teachers to go over the ground slower and better and make difficult subjects plainer for the pharmaceutical student. It would also afford more time for the quizzes and the laboratory work.

It seems to me that more attention should be given to the student's time and work in the laboratory. Instruction should be given to section classes consisting of twenty or twenty-five at a time, not a hundred or more, as is usually the case, as there is too much confusion and racket in an arrangement of that kind. Smaller classes would enable the instructor better to watch the progress of each student, and to give him more personal attention.

There should also be more frequent test examinations, especially so in the laboratory work, at least one such examination every two months; and unless a student has a good average at the end of a session, he should not be allowed to come up for the final examination. All students, before taking their finals, should be proficient in the chemical, pharmaceutical and pharmacognosy work. I am sure all this could readily be accomplished in almost every case and with excellent results, providing it was done during the four-year course; but, we could hardly accomplish it with a two-year course.

Regarding our boards of pharmacy, great care should be taken by the State pharmaceutical associations in the selection of candidates for board examiners: none but those who are experts should undertake to examine an applicant for a license. While many members of our boards throughout the country have been and still are very capable gentlemen, yet there have been some whose knowledge of pharmaceutical science was not very profound, and they would have never been examiners had it not been for the politics they played. None but an expert should be appointed for an examiner of any board of pharmacy, one who knows his subject from beginning to end, and does not have to get his questions out of text-books and then ascertain from the same source if they have been answered correctly.

PHILEMON E. HOMMELL, M. D.

[Dean of the New Jersey College of Pharmacy, Newark.]

Board examinations are a necessity, believes a dean in the East, to keep out of the ranks of pharmacists such "grafters," "quiz compend fiends" and "memory sharks" as squeeze through college on the installment plan. He states the case clearly and succinctly, and presents his conclusions in a clear-cut manner. Hear him:

Are Not Colleges to Blame for Graduating Ignorant Men?

Orono, Me., August 4th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I have read with interest in your July issue the examination questions of the Pennsylvania Board of Pharmacy, and the answers thereto made by three unsuccessful candidates.

For the clarification of the issue thereby presented, it is fortunate that these unsuccessful candidates were graduates of high-class pharmacy colleges: fortunate, for otherwise the almost certain average judgment on such failure would be that it demonstrated the insufficiency of the pharmaceutical training of the candidates. Under present circumstances some other explanation must be the true one; for no one in his senses would believe that an institution and training that have given us such men as Dr. F. E. Stewart, George M. Beringer, Prof. H. V. Army, and the beloved and lamented Hallberg, are at the same time to be held responsible for the vaporings of Candidate "Smith."

"But," it will be asked, "are not the colleges to blame for graduating such men as these?"

Here some things, not commonly understood, should be considered. These men in applying for admission to college necessarily presented satisfactory credentials, or they would have been rejected. Possessing these credentials they could not be excluded, in absence of impeaching evidence. They therefore entered, and having entered they became in a sense merged in the student mass, only attracting individual attention during recitations, laboratory reports, etc. As these recitations and other tests are scattered through the entire length of the two or more

years of their course, it not seldom happens that a poor student (one who never does honest and thorough work) nevertheless, by knack of fair memory and "plugging" for an important recitation or examination, may really never fall below passing grade. One after another the subjects of the curriculum may be passed, *pro re nata*, leaving at the end of his course no alternative to the college but to graduate the candidate.

But in facing the "State board" his problem is different. He has no "line on" the probable questions to be asked; and he must pass in all subjects, and at this one time, or not at all. Instead of, as at college, passing on the installment plan—and taking two or more years to do it—the test is compressed into one to three days at most. For the "quiz compend fiend" or mere "memory shark" this is a real ordeal; and the joints in his armor are visibly gaping at the end of it.

A properly designed machine for turning out carriage spokes is uniformly a success. Why? Because the raw material furnished is uniform and select in kind and quality. But suppose the material furnished be part bass-wood, part punk, and part hickory, then what of the finished product? Would not the shallow thinker vote the machine a failure? Such is the problem of the college. Like the Church, it may be likened to "a net which draws forth fish good and bad." Also like the Church its high ideals and ministrations are scorned by those who filled with the pure mammonism of the age "care for none of these things." You can rope down a man and by hypodermic injection, or otherwise, force into his system a drug which will have its full and certain effect, no matter what the opposition of the patient. But you can't do that in college. Therefore, until we better know how to "minister to a mind diseased," or to a debauched or obstinate will, we shall always have with us "Smith," "Brown" and "Jones."

Does anyone believe that this limping trio have any real or higher interest in pharmacy than the "graft" they hope to get out of it? Where, then, is their failure? Simply that they have no true inspiration or love of their calling! Failing this, they fail in their preparation, always! The lover counts not the cost nor the hours lavished on his adored one. As a foundation for the home, for such love there is no substitute; and in like manner neither is there in the preparation for pharmacy any "near," "almost," "oid" or other semblance or substitute for an all-consuming, all-else-excluding love for the calling.

Incidentally, the published report from Pennsylvania emphasizes the need for the pharmacy board, as a "court of last resort"; and the unwisdom of registering graduates without the additional test.

W. F. JACKMAN.

[Dean, Department of Pharmacy,
University of Maine.]

Co-operation of Examining Boards and Educators Would Help.

Taking what seems to be quite a different view from that of Prof. Jackman, a leading Western educator appears to be of the opinion that boards of pharmacy should work with the colleges in their respective States to give the students and prospective candidates an idea of the questions to be asked. His letter in full follows:

New York, July 24th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I have read with interest and profit your editorial on "Reform Needed in Our Pharmacy Schools," and Mr. Emanuel's comments. It is impossible to do justice to these timely articles in a few words and to do this while I am wending my way to Boston, where I shall read a paper before the American Pharmaceutical Association bearing upon the subject.

To give you some idea of my views, I would say: When the School of Pharmacy of Kansas was created it was my plan to have the "State board" give mid-winter examinations to the students of the school, but this was never consummated. Instead, and as a sort of compromise between bodies of varying ideas, representatives of the State board, chosen by the State association and the regents of the university, conducted unofficial examinations of college students. This plan, it was felt, would secure inti-

mate relation and co-operation between the two institutions. Unfortunately, after a few years, it was abandoned.

I believe we should strive to bring together boards of pharmacy and teaching institutions of pharmacy. The demands of each should be well considered. The method and standard of pharmaceutical education should be a compromise, so to speak, between these important bodies.

L. E. SAYRE.

[Dean, Department of Pharmacy,
University of Kansas.]

The Supervision of the Board Should Accompany the Student.

Dr. Philip Asher, dean of the New Orleans College of Pharmacy, is of the opinion that it might be well for the board of pharmacy to have control over the young man who enters a drug store for the purpose of learning the business, from the time of his entry until the time of his licensure as a full-fledged pharmacist, even passing upon his fitness to enter college, regardless of any certificate issued by an educational institution.

The results of the Pennsylvania examination, he continues, reveal conditions which are indeed deplorable. The questions and practical work were adapted to the understanding of students who had received adequate training in colleges of pharmacy.

During his fifteen years' experience as a teacher Dr. Asher has seen many young men who under ordinary conditions displayed coolness, intelligence and aptness, but when on examination showed just the opposite qualities. Some of the brightest students, he has found, "go all to pieces" when subjected to the ordeal of an examination. He has observed the same thing in business. He concludes, however, that something more than herein indicated was the matter with "Smith," "Jones" and "Brown," the three Pennsylvania candidates whose answers to board questions appear in the CIRCULAR for July, page 360—maybe they waited too long after graduation before attempting the board examination. Many of the questions asked by the board were based upon first-year work at college and perhaps the boys forgot their first year's education while getting their second year's.

In conclusion Dr. Asher suggests co-operation of boards and schools to bring about better conditions and says:

But, be it as it may, there is something wrong, and it would be well for all parties concerned thoroughly to sift this matter. While upon its face it does appear astounding, a thorough investigation may reveal mitigating circumstances. We are more or less prone to hold up our hands in horror and make a big fuss over things. In the interest of higher pharmaceutical education every phase of this matter should be examined.

Common-Sense Educational and Examining Methods Needed.

One who modestly claims to be only a plain country druggist, although from his letter-head it is gathered that he is a "Ph. B., Phar. D.," and a chemist, brings into the discussion some ideas not acquired while acting in the capacity of either a teacher or a board examiner. He writes:

Saint Matthews, S. C., August 6th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I have been reading with great pleasure the articles by the different writers concerning the college graduates and the boards of examiners.

Although I wish to say something on the subject I feel very much as did a young magistrate who was hearing his first case. This young magistrate was sadly deficient in

legal lore, and when the attorney for the plaintiff had concluded his argument the magistrate said:

"I decide this case in favor of the plaintiff."

"But," objected the counsel for the defendant, "you have not heard my client's side at all."

"It makes no difference," replied the magistrate, "but if you wish to say anything you may do so."

When the attorney for the defendant had concluded his argument the magistrate exclaimed:

"Wonderful! Upon my soul! The defendant wins now!"

So, I think that there must be something right and something wrong with both the boards and the colleges. Just what is wrong with each it is difficult to say. I have heard the colleges accused of being too "scientific" and "professional" in their teachings, and the boards of being too "practical" in their examinations. I have often wondered if this was not the truth, only reversed—if the faults of which the one is accused are really not the faults of the other, and vice versa. In other words, it may be that the professors in our colleges, not having been actively engaged in the commercial side of pharmacy perhaps for some years, are apt to overshoot the mark and make their teaching too practical. The boards, upon the other hand, occasionally seem to forget what is actually required of a pharmacist in everyday practice.

I remember that one of the questions in chemistry asked me by a member of the board was: "What would be the color of the blood in poisoning by carbon dioxide?" I have spent more years in a drug store than I care to tell now, but I have never found any occasion where it was necessary for me to know the color of the blood in a case of carbon dioxide poisoning, except the occasion just mentioned.

As a very humble and ignorant country pharmacist I believe that it would be a good plan for our professors to spend their vacations working in a drug store, and for our members of boards of examiners to spend part of their time at college.

Another good plan would be for the examiners to go over their questions carefully and ask themselves if they could answer the questions which they ask without the aid of a book of reference, and if so, would the questions be of value in testing the fitness of the candidates for the practice of pharmacy.

In short, let the examiners and the professors of each State get together and decide what is actually required of a pharmacist. Let the professors then teach at least this, and the examiners examine the graduates on what was required of them by the professors in their colleges.

B. O. BERRY.

Drug Store Practice and Pharmaceutical Education Are Incompatible.

Mr. Berry's views are very similar to those of another non-teaching reader whose daily life puts him in a position to judge what qualifications make for success in the real everyday drug world. Out of the busiest mart in drugdom he writes:

Downtown Manhattan, August 17th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Your article on "College Graduates before the Board" [July issue, page 360] and Prof. Remington's letter in defense of the colleges [August issue, page 425] deal with one of the most vital and irksome problems connected with the education of the American pharmacist. And I should say that every pharmacist who would like to see his profession in a flourishing condition, ought to help in the solving of this problem by all possible means.

Who is to be blamed: the colleges or the State boards? Faults there are on both sides; the greatest fault is on the part of the pharmaceutical associations.

Why do the students fail? But, really, considering the way in which practical pharmacy at large is now conducted, we should wonder that such a considerable percentage of graduates are making good. These young men get acquainted with the scientific and professional part of pharmacy at college only and are before and after school and during their time out of school, for the most part selling stamps, cigars, fancy goods, perfumery, bric-a-brac of every description. Should we wonder that they do not keep in their heads the nonsense (it is nonsense

as long as they are unable to apply it in life) taught at college?

The State board questions should be 90 per cent. matter concerning stamps and department-store goods, and about 10 per cent. concerned with professional and scientific subjects. Then the boards would hardly have anybody of the present pharmacists not up to the standard.

There is only one remedy applicable to the deplorable situation: Raise the standard of educational requirements for entrance to the pharmaceutical profession. A full high-school education should be possessed by the would-be pharmacist before he enters the employ of a pharmacist; and he should have two years' practical experience before entering college. The college term should be a full three-year course, giving the student not only an education as a pharmacist proper, but also as a public analyst and hygienist, so enabling him to fill his right and only place in the community, that of a health officer, on an equal footing with his brother the physician to the best advantage of both of them and their patrons. And one year of practical experience after graduation should be required before the graduate was permitted to manage a pharmacy.

The State boards should be retained, not for the purpose of torturing again young men and women with examinations that prove nothing but to watch the colleges, see to it that they give to their students the proper training and not pass them with quasi-examinations. The boards should participate in the outline of subjects to be taught at the colleges and be represented at the college examinations.

This reform enacted, there will be the possibility of lessening the number of unworthy persons coming into the profession; and the old members will be made more professional with an outlook of earning a living without resorting to the use of department-store methods.

The results that will follow the consummation of this reform cannot be expected in a year or two—but in about ten or fifteen years the entire aspect of the profession, its standing would be changed; it would be esteemed. This is not a dream; the plan I have outlined, to a greater or less extent, obtains in France, where, so far as privileges are concerned, the pharmacist is in the same condition as his brother-professional in the United States.

PETER AMSTERDAM,

Bubbling Blue for Laundering.

Chinese blue.....	50 grammes.
Sodium bicarbonate.....	105 grammes.
Tartaric acid.....	30 grammes.
Powdered talc.....	15 grammes.
Stearin	1 gramme.
Alcohol	80 c.c. (mils).

Reduce all the solids to a fine state of division; triturate them together and work in the spirit. Pass the mass through a granulating sieve; spray the granules with a thin liquid petrolatum, and let them dry.

Brass Polish.

Liquid petrolatum.....	8 ounces.
Butter of antimony.....	¼ ounce.
Alcohol	4 ounces.
Diluted acetic acid.....	8 ounces.
Jewelers' rouge.....	½ ounce.

Mix the butter of antimony with the oil and shake well for several minutes; let stand for several hours, and add the alcohol, shaking thoroughly. Shake the rouge with the acid, and mix the two liquids.

Stick Salve, or Roll Turpentine.

Yellow wax.....	1 pound.
Resin	4 pounds.
Linseed oil.....	4 ounces.
Oil of turpentine.....	4 ounces.
Make into sticks weighing about ½ ounce each.	

American Pharmaceutical Association.

Fifty-ninth Annual Meeting, at Boston.

Of course everybody expected the Boston meeting of the American Pharmaceutical Association would be a success, and it was. Boston druggists, Boston weather, Boston hotels, and everything in and around "the Hub" seemed to conspire to make the fifty-ninth annual meeting full of pleasure, full of business, full of all the good things which fall to the lot of those who attend these annual gatherings of America's representative pharmacists. The sessions were held in the Hotel Vendome, where plenty of large and small meeting rooms were provided.

Board members from far and near were present to attend the meetings of their own organization, and did much to lend interest and variety to the proceedings. The attendance was good, although the druggists from the New England States did not appear as numerous as might have been expected.

In the matter of entertainment, Boston always sets a high standard, and those who were within her hospitable borders on the occasion now under discussion can testify not only to the large amount and pleasing variety of the features of the meeting provided for their pleasure, but for the cordial manner in which they were presented. The association probably will not again wait thirty-six years before holding another meeting in the New England metropolis.

NEW OFFICERS.

Some of the general officers are elected by the members by mail ballots prior to the meeting, and some are elected by the council. Section officers are chosen by the respective sections. The officers for the ensuing year are as follows:

Honorary president, Henry Biroth, of Chicago.

President, John G. Godding, of Boston; vice-presidents, Wilhelm Bodeman, of Chicago; Charles M. Ford, of Denver; and Ernest Berger, of Tampa; secretary, James H. Beal, of Scio, Ohio; treasurer, H. M. Whelpley, of St. Louis; and reporter on the progress of pharmacy, C. Lewis Diehl, of Louisville.

For officers of the respective sections, the following were elected:

Commercial interests—Chairman, E. Berger, of Tampa; secretary, David Stolz, of Syracuse; associates, B. E. Pritchard, of Pittsburgh; Louis Berger, of New York; and F. H. Carter, of Indianapolis.

Scientific papers—Chairman, W. O. Richtman, of Satsuma Heights, Fla.; secretary, C. H. LaWall, of Philadelphia, these two to choose a third member as associate.

Pharmaceutical education and legislation—Chairman, J. C. Wallace, of New Castle, Pa.; secretary, W. J. Teeters, of Iowa City; associates, Philip Asher, of New Orleans; L. D. Havenhill, of Lawrence, Kan.; and H. D. Kniseley, of Checotah, Okla.

Practical pharmacy and dispensing—Chairman, P. H. Utech, of Meadville, Pa.; secretary, W. A. Hall, of Detroit; associate, J. L. Lascoff, of New York.

Historical pharmacy—Chairman, Otto Raubenheimer, of Brooklyn; secretary, C. A. Mayo, of New York; and historian, Edward Kremers, of Madison, Wis.

THE COUNCIL.

W. M. Searby having died, and the terms of the other two members of the council installed in 1908—S. A. D. Sheppard, of Boston; and H. P. Hynson, of Baltimore—having expired, the following three new members-elect of the council were inducted into office—E. G. Eberle, of Dallas; J. M. Good, of St. Louis; and George F. Payne, of Atlanta. The new officers of the council are, Chairman, E. G. Eberle; vice-chairman, J. M. Good; and secretary, J. W. England, of Philadelphia.

THE NEXT MEETING.

Not being able to agree upon a place at which to hold the meeting next year, the committee on time and place of meeting recommended that the association choose between Denver, Cedar Point, and Nashville. At an adjourned meeting held on the boat returning from Plymouth, Denver was chosen, the vote being, Denver, 65; Cedar Point, 22; Nashville, 8. E. L. Scholtz was appointed local secretary. The selection of the time was left to the council.

Nominees for officers for the term 1912-13 are given on page —.

FIRST GENERAL SESSION.

Monday Afternoon, August 14th.

When President Eugene G. Eberle, of Dallas, called the fifty-ninth annual meeting of the American Pharmaceutical Association to order in the large meeting room of the Hotel Vendome August 14th, at 3:15 p. m., there were on the platform with him not only Honorary President McIntyre, President-elect Godding, Vice-President Day, Secretary Caspari, Treasurer Whelpley, and Council Secretary England, but many of the former presidents of the association, including John F. Hancock, of Baltimore (1873-4), who, with the exception of Enno Saunder, of St. Louis (1871-2), is the ranking ex-president, and C. Lewis Diehl, of Louisville (1874-5) who follows Mr. Hancock in rank, and who, incidentally, presided at the last previous meeting of the association held at Boston. Other former pres-

J. G. GODDING.

The New President, who did much to help entertain the visitors.

E. G. EBERLE.

The Retiring President, now Chairman of the Council.

idents at the meeting this year were in the order of their seniority—John Uri Lloyd, of Cincinnati (1887-8); Joseph P. Remington, of Philadelphia (1892-3); Edgar L. Patch, of Boston (1893-4); James M. Good, of St. Louis (1895-6); Henry M. Whelpley, of St. Louis (1901-2); George F. Payne, of Atlanta (1902-3); Lewis C. Hopp, of Cleveland (1903-4); James H. Beal, of Scio, Ohio (1904-5); and Joseph L. Lemberger, of Lebanon, Pa. (1905-6).

The meeting was opened with prayer by Rev. Albert Rhys Williams, of East Boston, and addresses of welcome were made by Lieutenant-Governor Louis A. Frothingham, Acting Mayor Walter L. Collins (in the absence from Boston of Mayor Fitzgerald), President George S. Smith, of the Boston Chamber of Commerce, and C. H. Packard, local secretary. To these addresses responses were made by R. H. Walker, of Gonzales, Texas, and C. M. Ford, of Denver.

Vice-President W. B. Day, of Chicago, took the chair while President Eberle delivered the following address:

PRESIDENT'S ADDRESS.

An ambition exists in every man to excel in the particular field of endeavor he has chosen for his life's work and through which he seeks to gain his livelihood. Nearly everyone has a desire for the approbation and respect of those who have accomplished much in the same sphere of activity. The position with which you have honored me had an attraction for me, but judging my capabilities much less favorably than you have, no great hope for such preferment was aroused within me. While it may be said that in a particular section my labors in the cause of pharmacy have been more or less helpful, I know of no accomplishment which should have pointed me out for this mark of your favor. We are prone to judge ourselves more harshly than our friends do, and in truth care not to be accredited with greater deserts than we are relatively entitled to. No one should be seriously offended because of honest criticism being passed upon him from a source uncontaminated by ulterior or sinister motives. I speak frankly, realizing the importance of wise selection for the high offices of this organization. My year of office now coming to an end, I feel constrained to say that I have not had the time, if the ability had been mine, to do full justice to the position of president of the American Pharmaceutical Association. In other words, the work of the officers is influenced by their opportunities and environment, and we should select them carefully because of their fitness and qualification. No one could value more fully than I the honor you have conferred, and if the appreciation which your preferment has given me is a matter to be considered, then no mistake has been made; for no distinction has ever come to me which I prize more highly.

Associations are co-operative organizations, having for their

purposes certain advantages unobtainable, or at least not as easily attainable, by the individual, and give to each member a share of the accumulated benefits, whatever they may be. While it would perhaps be impossible to prevent it, were there any disposition to do so, those who, through selfishness or other motive, refrain from lending assistance, also share. With few exceptions, if any, large enterprises or great accomplishments which have distributive or general value are either directly or indirectly promoted through concerted action, and are not usually the result of individual endeavor. The labor, knowledge, investigations and discoveries of quite a few scientists have in a corresponding number of instances been striking examples of the possibilities for a student and worker who is competent and capable of applying to his use that which has been more or less in a state of development.

As with commercial enterprises so also with associations in most progressive eras, co-operation is not only essential, but in reality has been most active in inducing and inciting progressiveness. A period of this kind is characterized not only by utilization of all opportunities, deriving every advantage obtainable, but also by excessive wastefulness. As a result we have large co-operative enterprises, whereby many expenses are cut out and profits are the result of business volume. In the desire for securing all power and conserving all material—that is, converting it into merchandise—wastes are frequently overlooked, because they are cumulative. The farmer draws upon the soil without returning the essentials for further production, and succeeding years evidence the same weakness incurred through methods of business, wherein specialization is carried too far and the help becomes unfitted for diversified work. Serious defects occur in the manufactured article because portions of the crude material are utilized which should have been discarded, or, to make an article more attractive, processes are employed which in part destroy its value. Another view is embodied in the destruction of forests wherein thought is only given to immediate returns. Comparatively, the former may be considered in the light of a business being injured by combining with it incompatible adjuncts, the latter doing away with remunerative and essential departments, forgetting that a future day will find their return impossible, however sorely missed. The thought might be carried into our educational systems, wherein we endeavor to teach all in the same branches, perhaps giving a superficial polish, but many times to the neglect of thoroughness. The tendency is to hasten education, without insisting on practical application of the branches necessary in the pursuit of business or trade. I cite as an example the adaptation of mathematics, which to us is more familiar in chemical problems and calculations necessary for pharmaceutical operations. The great mass leave school at the age of fourteen, and before they find the need of their school studies have to a great extent forgotten them, or, if they remember them as theories, are unable to make practical application thereof. The German government supports continuation schools in which attendance is required for the boy until the age of eighteen, and where the education received in the regular schools is applied in problems relating to arts and trades. Ask the young men who come to pharmacy schools, even after more or less higher school training, to calculate relation or proportion in figures and they will quickly respond; but request an answer wherein the same calculation is required, only that it is applied in actual work, and a large proportion suffer with nervous indisposition. This is largely due to misdirected ambition, enforced with the permeating desire to accomplish much in a very brief period, forgetting that thorough understanding has a far greater value.

Ambition is a growing power, contributing largely to the achievements in every age. Without its influence there would be lethargy, no progress or advance. Every business that has been successful, every profession of real value to humanity, each trade that exhibits the marks of improvement and every contribution to art and science, has been promoted because of the ambitions of those engaged in the pursuit. Life is becoming more complex and the demands upon the individual correspondingly greater, because his needs are greater. The possibilities in every department of activity and investigation are also greater, consequently ambition becomes a tremendous power in the minds of an ever-increasing number.

Moral courage requires greater strength of character and self-sacrifice than physical bravery. In expressing fearlessly one's honest convictions, disregarding friend and foe, especially when there is nothing to be gained except the satisfaction of speaking and contending for a just cause, friendships are often sacrificed and the antagonism of malignant tongues incurred.

The drug business, viewing it generally, exhibits a complex problem for one association to cope with, in fact, almost an impossibility. The divisions are so at variance that they almost present incompatibility in association work. Again, the conditions prevailing in one section of the country vary from those of another, within States there is a wide difference, and even the stores of the same city will present quite different appearances and are conducted by men who entertain almost divergent views. An association must be representative of its membership—that is, its objects must include the aims of its constituents, the purposes of organization being that the individual member may profit from the experience and knowledge of others, and reciprocate. The idea of co-operation is further promoted by carrying into effect regulative and corrective measures, or providing means or methods therefor, and through both schemes also protecting and serving the public.

Experience has proven that there is necessity for the work promoted by both the American Pharmaceutical Association and the National Association of Retail Druggists; but the question arises whether, through joint effort as one body, the results would not be more advantageous to the constituents. Certainly there ought to be an inter-association between these and all co-related organizations, making it possible to work together in matters of joint interest for mutual benefit. While the objects that are uppermost in the one association, as now conducted, are of secondary importance in the other, an association should represent the combined interests of its entire membership. If, on the other hand, the missions of the two

associations are to remain distinct, then an endeavor ought to be made to define the precincts of each, and one should not encroach seriously upon the territory of the other. The time will probably come when attention to the mercantile side of the drug business and a demand for higher pharmaceutical education from those who pursue more closely the practice of pharmacy will bring about a still more distinct demarcation. Unquestionably, were it possible to bring about such a division, pharmacy would progress far more rapidly, and it is debatable whether it is not practical to make the division at this time without doing serious hurt to anyone. Experience of the older States, where the advantages of schools and regulative measures have obtained for a long time, evidences that under prevailing conditions we cannot hope for very rapid progress. Even the medical profession is debating the advisability of a two-degree system in medicine.

Many of the undesirable conditions in human affairs are the result of selfishness and thoughtlessness. We do not listen intently enough to the poet and philosopher; we think of to-day, and not of to-morrow, and do not apply the lessons of the past. Under the old labor system a man was offered a certain price for doing piece work, when it was found that he could do double the amount the price was cut, or he received relatively less per day. The new system increases the wages and reduces the hours of labor. Man resents inequality and injustice just as soon as he has the power or means of doing so. A system that does not consider both the investment and the labor needs adjustment. If it comes through force, or without due and careful consideration, the best results do not follow.

In the arts and trades this adjustment is brought about to some extent by classification or graduation according to the skill or knowledge required in the pursuit. This is also true in the drug business, where a wide variation in qualification, adaptation and selection exists, characterizing the respective establishments in accordance with the views and accomplishments of the one who conducts its affairs. It is an oversight to disregard the adaptability of those who enter the drug business, and it is disadvantageous to neglect the encouragement of those who strive to become qualified for pharmaceutical pursuit. The same causes which have induced unsatisfactory enforcement of labor rules have hindered and impeded promotion in pharmacy. The advancement of the votary has not been encouraged in the ratio of the call for higher requirements in order to practice pharmacy. The need for better qualification is generally admitted and that the status of the pharmacist should be higher; he should be in position to intelligently discuss scientific subjects with professional men and coerce their deference. This is an impossibility when actual pharmacy constitutes only a small portion of the daily duties, and the compensation is not as lucrative as that of the average mechanic. We are forced to admit that service and its pay have a relation and a bearing one on the other, that have much to do with its status and advancement.

Schools of pharmacy and also boards of pharmacy should come into closer touch with the public and more particularly with those engaged in the drug business. The people demand publicity and there is no need for going beyond the precincts of conservatism. The American Medical Association may be classed among the strongest of advertisers. The exposure of frauds, the evidencing of activity to correct all abuses and to purify the profession are most potent factors in this direction. The interest of the medical profession in matters that pertain to hygiene and public health generally, enlists the confidence, approbation and even enthusiasm of the people. There are similar opportunities for pharmacists, they should take a more direct interest in public affairs. Members of boards should instill the desire for progressiveness and advancement. Associations should espouse the cause they stand for and declare the purposes and need for their organizations. Schools should be of assistance in the promotion otherwise than in the education of the young pharmacists only. The druggists should be prevailed upon to make full use of the facilities of the schools, and while such features largely obtain, there are greater possibilities. The schools could well afford to make assays of the galenicals, prepare standardized solutions and in restricted instances some of the galenicals and other preparations when it is desired to perfect processes of manipulation or formula.

An association is composed of individuals and should represent their interests—a school of instruction, an advisory council. It should represent the best endeavors, the selected thoughts, the ripe experiences of all (deprived of the deficiencies, the superficial and valueless), combined and blended through discussion, careful and wise consideration, so that the association becomes most potent in advancing, directing and promoting the cause of its constituents.

In order to obtain the greatest good from association work there must be systematic endeavor, just as in a business. If system is lacking in any enterprise the results will more than likely bear witness of unconcerted activity; the work of one department may neutralize or make ineffective or valueless that of another. So for association work there should be well defined plans, even from year to year, until certain purposes decided upon are accomplished. In this particular there is much improvement desired in the usual programs of State associations, as the proceedings give evidence. Another serious fault, which possibly is included in the prior statement, is the passing of resolutions. Resolutions are important, but unless carried out have a tendency to weaken the cause of the association; wavering in the execution of a purpose which has been declared necessary and right, is as harmful to organizations as to individuals. A feature quite as apt to destroy interest is the delegation of too many duties to one person; more general participation in the work ought to obtain.

The American Medical Association realized the importance of a close attachment between State and local bodies as a means of sustaining the national organization, and also that the long recess intervening between the annual sessions was not conducive to its strength; a very wise conclusion, the correction of which has built up, with the aid of its official publication, a powerful organization, in position now to command attention in legislative halls and gain a respectful hearing from the public. The advantages are reciprocal; the co-

operative influence of State bodies gives support to the purposes of the national organization, and this influence is not ineffective locally and individually. As a result it has not been a very difficult matter to exact higher educational requirements of those who would prepare for the practice of medicine, and progressively, also, longer years of more thorough preparation and study before granting the required credentials.

The most valuable feature, however, is represented in the association scheme of membership in the national body through the linking of the local and State organizations. The difficulty in providing a similar system in connection with the American Pharmaceutical Association lies in the prevailing condition of the drug business. There is a lack of ambition and a deficiency of interest; the proprietor usually gives attention to the conduct of the store, while the pharmacist is accorded so little time which he may call his own that he desires to use this in some other way. The upholding of prices, the introduction of a line of remedies that bears a large profit or of methods for collecting accounts, seem to appeal much stronger than pharmaceutical matters. It, therefore, is very

WILHELM BODEMANN.

The new First Vice-President, who could not be present.

HENRY BIETH.

Honorary President. Was Local Secretary at the World's Fair meeting.

suggestive that the means which are more directly connected with remuneration from the business are uppermost, and that as association work must consider all departments it is unfortunate that in many drug stores pharmacy is not deemed of greatest value to the business.

The establishment of branches was a wise and important move, but is not far reaching enough; the numerical strength, except in the larger cities, is insufficient to maintain an active branch. Co-operation seems the only solution, either working conjointly with the branches of the National Association of Retail Druggists or with local medical associations. Through the latter connection pharmacists may wield an influence for much good, and also benefit themselves professionally. My desire, however, is for the strongest possible co-operation between this association, the National Association of Retail Druggists and the various State organizations, and, if deemed expedient, with other closely allied bodies. I do not favor amalgamation, believing that this weakens the activities, more particularly of the national associations. Ex-President Beal recently presented a carefully prepared address before the Missouri Pharmaceutical Association embodying valuable suggestions on this subject. I advise the appointment of a committee who shall take this matter under consideration, and confer with the National Association of Retail Druggists, looking forward to the establishment of a federation of pharmaceutical organizations by means of a delegate body, in which these associations are to be appropriately represented. A resolution passed at the last annual convention of the N. A. R. D. is broad and generous enough to warrant our anticipation of their co-operation. It reads:

"Resolved, That we foster and encourage most cordial and fraternal relations with all associations and organizations which have for their object the welfare of professional or commercial pharmacy."

The Journal of the American Pharmaceutical Association should render great service and induce a large accession of membership. Undoubtedly one of the chief reasons for withdrawals from the association is the fact that these members do not become thoroughly acquainted or actively enlisted as working members. True, the Bulletin has been a monthly visitor for several years, but it has been chiefly a medium for the branches and not for the membership at large. The opportunities for the new publication will be very much greater. Instead of bringing the full report of the proceedings to the members six months or more after the transactions, and once each year, the journal will communicate these in monthly installments until the report is concluded. The annual copy has always met with a generous and general welcome, but the first perusal devoted thereto was frequently the last, except for occasional reference. The contemplated publication will find its way to the members every month, and should establish a closer and continuing relation. As the official organ of American pharmacy, it should aid in bringing together the pharmacists of the country, and in their hands be a most efficient means for advancing pharmacy. There are many suggestions which would point out the great value and possibilities of the journal. Primarily it should be the means whereby the members are held together for a common purpose, becoming the monthly visitor, the influence of which prevents

estrangement, develops interest and keeps them fully informed relative to all activities of the association. As the organ of the association, representing its membership for the aims and purposes laid down in the constitution and directed by the by-laws, its policies are at once quite well defined. The publication should become the mouthpiece of the revision committees of the United States Pharmacopoeia and National Formulary. So the many advantages offered might be continued and be made to burden this address unnecessarily, as the subject has been very fully and ably presented heretofore and will receive your further consideration. I desire, however, to make a few general references and recommendations. The journal is a creation of the association, and enthusiasm over the prospective success should not permit us to place the value of it over that of the association, neither should the association strive to become a firm of publishers. Attention should, however, be given to securing subscribers to the journal, whether they affiliate with the association or not. The history of the membership of the American Medical Association shows that a very large percentage were at first only subscribers to their journal. The selection of the committee to manage the affairs of the journal is of far greater importance than the construction of plans and formulating details for its management. It is a matter of impossibility to provide for all contingencies that may arise; the journal, like every business venture, must have its inception and growth, and it is far better to select a committee qualified by business experience and imbued with the spirit of the association to conduct its affairs according to their wisdom and judgment, than to attempt with great detail to give direction and specifically define its business policies. I would further recommend a careful consideration of the practicability and advisability of having the general secretary become editor-in-chief, thereby making it possible to offer better compensation and secure the man best qualified for this most important position.

The sad event which deferred the publication of the journal was keenly felt by the committee on membership, for the journal was to be the strong talking point for the acquisition of members. This same occurrence, however, evidenced that the work of the individual is appreciated by the American Pharmaceutical Association, and accomplishment in pharmacy does not go entirely unrewarded. It is not in my province to speak of Professor Hallberg's usefulness as a pharmacist nor as a member of this body, for this privilege is delegated to others. We have also suffered loss by the departure of ex-President Eliel, who was devoted to pharmacy and to the association which gave him a profession. And now only a short time before this annual meeting death claimed Prof. Julian Baird, of the Massachusetts College of Pharmacy.

Commensurate legal regulations are essential for properly aiding and sustaining the advances made in pharmacy. Some years ago ex-President James H. Beal prepared both a model pharmacy and model narcotic law, which were adequate for the time and served most excellent purposes. The time has come when a similar work should again be undertaken, embodying the progress made since that time and covering conditions which have since developed. While no model pharmacy law can be prepared which would be generally acceptable as a whole, a closer conformity than at present exists is entirely practical. The same difficulties do not obtain relative to the construction of a narcotic law, as nearly all are agreed as to the principal points which should govern in the sale of narcotics.

I deem it also most opportune to consider liquor regulation in conjunction with this work. The prohibition of saloons has increased the sale of liquors for medicinal purposes in drug stores. While many are opposed to their sale, in any manner, by druggists, it must be recognized that others, just as conscientious and just as considerate of the interests of pharmacy, take a different view. This must be largely a matter for pharmacists of the several States to deal with, but the advice of this committee will doubtless be acceptable and the aid appreciated.

The present system of board examinations is more or less inadequate; too much stress is laid upon the value of answering questions, which frequently only proves the possession of a good memory. Until graduation becomes a general prerequisite, more attention ought to be given to practical examinations. A statement in detail should be had from persons competent to judge of the qualifications of the applicant for registration. Examination into the moral qualifications is almost as important as consideration of the professional attainments of those who desire to practice pharmacy.

Repeated violations of the anti-narcotic laws, and persistent non-observance of the regulations applying to the sale of spirituous liquors should be punishable by revocation of the license to practice pharmacy; and if the offender is unregistered should present an impediment, when he thereafter seeks to become registered.

A method of itinerant vending, or house-to-house distribution of drugs and medicines, more particularly of proprietary preparations, is extensively carried on in nearly all sections of the country. Such practice will prove a great harm to the people, who, not being aware of the danger, encourage these vendors by patronizing them. This offers an opportunity of selling drugs which in themselves may be harmful, or, if not, it unwisely fosters a medicine-taking habit. The vendors are as a class ignorant of the constituents and the effects of the products they sell, still they are willing to prescribe in order that they may sell.

I recommend the appointment of a committee, composed of one representative from each State, who will systematically take up these matters and present their conclusions at the next convention of this body, if possible, in the form of models for laws covering these subjects.

I would suggest to the committee for consideration the replacing of pharmacy boards by commissions with wider powers than usually given to the former. Also to consider the practicability of codifying the laws relating to the sale and dispensing of drugs, and bring them into one definite and comprehensive law, entirely consistent. The inadequate compensation of those who comprise the boards of pharmacy is not a wise or just provision, and in nearly every instance is prompted by a fear that the public would not sanction the en-

actment of a pharmacy law that would add to the State's expenses. The practicability of providing for commissions depends largely upon whether the people fully recognize the responsibilities of those who practice pharmacy, and realize that drug habituation and addiction, while an immediate expense, are progressive and the effects extend to future generations.

The suggestion is made that topics bearing hereon be presented for discussion at the meetings of the several State associations in the same manner as provided for by the commercial section. Further, that the members of the boards of pharmacy be more particularly urged to see that these important matters receive consideration before their respective associations.

The government is not only in position to fix the educational qualifications required of those in its employ, but should set an example of efficiency. The argument is applicable in practically all branches of service, to none more than those who look after the health of the people at large, and more directly those who have in their care the men of the army and navy. While direct credit should be given to those who have done valuable service within and without the American Pharmaceutical Association in promoting not only the standing, but the pay for services of those in the government's employ, they doubtless have been prompted by the call of duty, and to them approbation of the accomplishment is more gratifying. Qualification should always be of first consideration, but I contend that remuneration and recognition not only promote a higher standard, but are essential for maintaining such prerequisite. A higher standard, or advanced recognition given to those in the government employ, contributes a gauge according to which the public passes judgment on the votaries. I therefore commend the work which has been done by our association, and advise continuance of our unabated interest in whatever will advance the educational prerequisites and enhance the welfare and well-being of those participating in this service of whatsoever station requiring proficiency in pharmacy.

The administration and purposes of all associations resemble somewhat our form of government. The members govern themselves and promote and protect their interests through a chosen number from among themselves, who are charged with the performance of specific duties, and to whom certain authority and discretionary powers are delegated. When wise selection is made, or if from among the larger number votaries imbued with a progressive spirit and sincere devotion to their calling associate themselves, we may reasonably expect an economical administration or an organization which will truly represent whatever may be for the best interests of all engaged in a like occupation. An association, according to the selection of its membership and the scope of its purpose, speaks relatively for all likewise engaged. It is to be presumed that all associations worthy of organization have objects in view which extend beyond the selfish confines of their individual interests. Thus, while our association primarily may be constituted for the benefit of its membership, all engaged in the drug business in whatever capacity have a part; nor does the influence cease here, but extends to every home. The work of an individual is judged according to its quality, and also its worth to humanity. Associations are organized bodies of individuals engaged in a common cause, and, therefore, judgment is relatively passed on them. Much is expected of those to whom authority is given, and those who enter vocations wherein the integrity of the individual and adequate knowledge are necessary as a protection to the public assume grave and serious responsibilities, which they should energetically and conscientiously discharge to the best of their ability.

The American Pharmaceutical Association at its inception had in view the purposes to which we subscribe to-day. These founders realized, as we do, that to give the public our best service required not only that the pharmacist must be competent and compound accurately, but that he must have the proper material from which to make his preparations. Also, that their responsibility did not cease here; that it was their further duty to caution the inexperienced against unwise administration of medicine and protect them against imposition by the unscrupulous. In these suggestions we have largely the fundamental principles of the pure food and drugs act, and without great stretch of imagination we may say that the agitation for this measure was seriously set in motion by them. The pure food and drugs act is a protective and economical measure. A discussion of these phases is unnecessary, being so well recognized and quite generally accepted. We may be in thorough sympathy with its provisions, but unless we evidence our continuous and deep concern in its proper administration and lend our support and give encouragement to those who discharge their duties faithfully, without fear or favor, indifference is very apt to result. Apparently there is at present no immediate cause for such alarm, but we cannot afford as citizens or as pharmacists to permit a state of innocuous desuetude to obtain with respect to this measure, so far-reaching in its effects, and the underlying principles of which are so easily adaptable to many other activities.

You are familiar with the recent supreme court decision which holds that the pure food and drugs act does not cover the knowingly false labeling of nostrums as to curative effect or physiological action. The president has called the attention of congress to this matter with a view of having provisions made correcting these defects. Fraudulent misrepresentations of the curative value of so-called remedies contribute a distinct menace to public health, and tend to bring pharmacy into disrepute by attaching the stigma of complicity. I commend your endorsement of such correction of the law.

During the past few months several of our esteemed members who are active in the administration of the pure food and drugs act, and also one who is an honored ex-president of this association, have been placed in a more or less embarrassing position. How far this association desires to go in expressing itself relative to this matter, or what the attitude of the president should be, may be deserving of careful judgment. I, however, assumed the authority to address the president of the United States, protesting against the removal of the chief of the bureau of chemistry, department of agriculture, Dr. H.

W. Wiley, and testifying our recognition of his integrity, ability, sound judgment and strict adherence to duty. I considered that such or some similar statement was due from this association, and hope that my action will have your endorsement. I trust that this association will also express, in a formal way at least, acknowledgement of the services of the chief of the drug laboratory, Dr. Lyman F. Kebler, and our confidence in him. Relative to ex-President Rusby, we cannot be led into any of the difficulties that might obtain with the chief of the bureau of chemistry and chief of the drug laboratory; in fact, expression is almost unnecessary, unless it be to again assure him of the continuation of our confidence and esteem, and deploring the unfortunate turn of affairs, which, without the possibility of reflecting adversely, has undoubtedly been a source of great annoyance to him.

HARVEY W. WILEY.

HENRY H. RUSBY.

Two men who are loved for the enemies they have made by enforcing the food and drugs act.

It is very important that the food and drugs laws of the several States harmonize, and such direction should receive our support as far as it is practical. This again suggests the importance of inter-association between all bodies having certain objects in common. The best opportunity for shaping laws of this character is possibly through the association of agricultural chemists, who would doubtless welcome our co-operation, and among their membership there are quite a few of our association.

The committee on drug reform has been diligently at work endeavoring to popularize and promote uniformity of legislation in different States, and also, which is equally important, to secure uniform administration in the enforcement of the pure food and drugs law. This committee has given some attention to the itinerant vending of medicines. Laws regulating the practice of medicine and pharmacy are primarily for the protection of the public. The same ideas which prompted the people to protect themselves against harmful or adulterated drugs or imposition, as well as ignorance and quackery, would obtain with regard to this method of selling medicines. In fact, it would seem that such a scheme circumvents the expressed desires of the people. I fully realize that this association is not in sympathy with that which constitutes the greater portion of this business, but would ask that you consider the advisability of expressing yourselves in favor of having all who sell or dispense medicines come under the supervision of pharmacy laws in the respective States. This method of vending is spreading rapidly in every section of this country, and the druggist, if not the pharmacist, is vitally interested. This association is concerned, because the plan of placing medicines in the homes induces at least the unnecessary taking of medicines, if not leading on to drug habituation and other coincident dangers.

The American Medical Association at their recent convention adopted a resolution discouraging dispensing by physicians. This custom is extensively followed, and in some localities is growing instead of abating. Leaving the pharmacist out of consideration entirely, such practice does not conform to the general declaration of the American Medical Association. The public is not protected when the same individual diagnoses, prescribes and dispenses, even though the physician be a pharmacist. If a physician dispenses, then the preparation he prescribes, or the components, should be subject to inspection. Drug laws are not just if they provide special privileges. One standard should obtain, regardless of who dispenses the preparations. Though the view expressed in the resolution has always been accepted by the majority, the endorsement again testifies the strong desire of the American Medical Association to correct practices which are not helpful to advancement.

The bill to establish a department of health promises considerable discussion before a measure is perfected that will be acceptable to the majority. There seems to be a fear, whether real or imaginary, that the fundamental right of the citizen to choose whatever mode of healing he shall employ will be abridged.

I believe that the bill does not contemplate such a move, but that it is intended to do valuable and much-needed service for all, and implies that the conservation of the health and physical well-being of the human race are of equal or greater importance than the conservation of animal and vegetable life.

I feel confident that the committee on national legislation has fully considered this important matter and will present the subject in more ample form than would be advised in this address. While our views would likely be in harmony, their

more considerate presentation will be of greater service to you in arriving at a conclusion for your action. I desire, however, to have your recommendation specifically provide for recognition of pharmacy in such department, and under the further assurance that the measure provides for the protection of public interests and welfare, and retains for all citizens their inherent right to employ any system of medical practice which in their judgment is most efficacious and trustworthy, let us give our counsel and support in the promotion of this necessary provision. Some must take the lead in this matter, and energetic interest should not, without just cause, be construed as being prompted by sinister or selfish motives.

It is neither practical nor desirable that the revision of the Pharmacopœia be discussed in this address. Relative to the scope of the Pharmacopœia there is perhaps a greater diversion of opinion between pharmacists and physicians than any other specific point. Believing the members of this association would favor a presentation of the subject from the physician's viewpoint, I took the liberty of requesting the council to extend an invitation to Dr. S. Solis-Cohen, and he has been pleased to accept our invitation and will address this body.

The revision of the United States Pharmacopœia is proceeding as rapidly as is possible for a work of such magnitude and responsibility. Due consideration has been given to reports and suggestions of the various bodies represented at the convention, and the work of deciding upon the subjects presented in these reports is nearly finished; in addition, the questions left undecided by the convention, which were referred to the committee of revision, have all been practically settled.

Within the last month the list of articles to be admitted to the United States Pharmacopœia, ninth revision, has been decided upon, and it is the intention of the chairman to give publicity to this proposed list.

An important change in the plan of revision has been made, whereby the sub-committees who are entrusted with the details could be immediately given subjects to work upon. This was done by proposing a list of articles that would certainly be admitted, like opium, cinchona, belladonna, nux vomica, etc. In this way no time has been lost, and now that the whole list has been voted upon, members are ready to take up all the other subjects.

The translation of the United States Pharmacopœia into Spanish has been of benefit to the association in the acquisition of membership from the West Indies. While Profs. Remington and Diaz encouraged these applications, it is safe to say that a closer pharmaceutical fealty now obtains, and we have reason to hope for further accessions.

The present revision of the National Formulary will evidence the elimination of many shortcomings. Unless conditions change materially, the Formulary should always remain the property of the American Pharmaceutical Association. The conditions are such, and the committees of the National Formulary and United States Pharmacopœia so constituted, that there is no reason why there should be conflict or disharmony. The committee will make their report during this convention, the work of revision being practically completed, and barring delays the Formulary should be ready for distribution by the first of next year.

Propaganda work has contributed much to the bringing together of physicians and pharmacists. Everyone realizes the possibility of carrying the idea beyond conservative bounds, but the chances are that time will correct such steps. Progress along any line is prompted by demand and directed by prevailing thought or conception of whatever is most conducive to the advantage of those directly concerned and interested. I am persuaded that the co-operative efforts of the two professions will ultimately adjust this propaganda, not only in strict accord with professional views, but conservative of public welfare.

In order to bring the National Formulary up to the standard which will make it entirely acceptable to physicians and pharmacists may require the elimination of certain formulas which should still be retained in some way that will make them readily accessible, and also maintain uniformity in composition and appearance of the preparations.

Up to this time the advisability of publishing a "Recipe Book" by the American Pharmaceutical Association has been questioned or rather discouraged. I consider such a proposition entirely practical and advantageous, and therefore commend for your reconsideration the publication of such a compilation.

The value of the pharmaceutical syllabus depends upon the co-operation of those engaged in teaching pharmacy, and those who thereafter critically inquire into the qualifications of the candidates who aspire to become pharmacists.

The latter should know what skill and knowledge are necessary for plying the vocation, and the educators advised of these needs can conform their teaching course for the preparation of students accordingly. These are essentially the ideas which prompted the syllabus. A clear and definite understanding is necessary, and actual use of the present edition is the only way to properly arrive at its defects. The acceptance which the work of the committee has received testifies the correctness of the presumption that a guide of this kind was desired.

I will not anticipate the report of the committee on patents and trade-marks. There is urgent necessity for reform, and the effort should be directed by co-operation between bodies interested in this correction. Quite a number of national associations have already given expression to views very similar to those held by the American Pharmaceutical Association. I would also call your attention to the advisability of bringing this matter before the Congress of Applied Chemistry, to convene in the United States next year, for discussion and action.

The Congress of Applied Chemistry meets in this country for the first time, and will welcome co-operation from this body. They are solicitous that the American Pharmaceutical Association have proper representation of our interests at the respective sections, and also with respect to the congress as a whole. I would ask that the council, acting with the president, be directed and empowered to provide for representation through delegates. I suggest that the meeting of this congress be kept in mind during the sessions of the association

and sections, with a view of participating in the mutual benefits to be derived from this gathering.

Invitation was extended to the American Pharmaceutical Association to be represented at the meeting of the National Civic Federation, in New York City, January 12th to 14th, 1911. I accordingly appointed a delegation of six, with Dr. William Jay Schieffelin as chairman, who addressed the convention on the subjects of "Uniform State Legislation" and the "Restriction of the Sale of Narcotic Drugs."

It was my pleasure to meet with the delegation of the American Pharmaceutical Association at the convention of the National Wholesale Druggists' Association last November.

Chairman Lyman F. Kebler addressed the meeting, and your president was given the opportunity to speak briefly on the related interests of these two organizations.

The business of this association should be transacted by a delegated body representing the membership. This subject, which has had our attention for quite a number of years, should be disposed of. So much has heretofore been said relative to this important matter that I will await the report and recommendations of the committee on reorganization.

The national congress is not in a strict sense a deliberating but a deciding body. The work is done in the committee rooms; were it otherwise, very little would be accomplished. So in our organization it is essential, for systematic and expeditious transaction, that a smaller but representative body shape and conduct the business of this association. A committee charged with such responsibilities must be carefully selected; when practicable, members should be nominated, so as to be fairly representative of the various sections of the country, though fitness is of first consideration. The meetings of this committee should not interfere with the transactions of the association or sections. This will require sacrifice on the part of at least some of the members, but every one should be willing to take a turn at serving in this capacity. While powers to transact the business of the association should be delegated, and the committee not embarrassed, the thought should not be lost that the committee is a creation of the association.

Our voting system appears to give quite general satisfaction. I would, however, recommend that the ballots for the presidential candidates be printed separately—that is, a separate voting slip for each of the candidates nominated for that office. While the inference has not been made, this would prevent any possibility of advantage through position on the ticket.

We have had a fairly prosperous year. The cash balance has been increased, though the permanent funds have not been largely augmented.

While we are increasing our membership, the problem of securing the greatest number of new members each year at a minimum expense is one which demands business judgment, and should be carefully considered by the association. I am firmly convinced that the American Pharmaceutical Association should go about the work of securing membership in a business-like manner without too closely contending that members should come to the association without solicitation.

I consider that the real purpose of life membership in an organization is to help the association. It is usually arranged for the purpose of enabling members to contribute a substantial sum to the organization and receive life membership as a recognition of the contribution, and should not be offered by the American Pharmaceutical Association as an opportunity for members to make a good financial investment for themselves. Our present rules should be investigated with a view of revising them accordingly.

We are living in an age of endowments for educational purposes. A generation ago men like Ebert recognized the necessity of endowing the American Pharmaceutical Association in order to place it in a position to encourage such aims. This and other endowment plans should be thoroughly understood by our members so they can appreciate the necessity and advantages of large and permanent endowments and of a good working capital. The contribution of small amounts from time to time by each member will insure an accumulation of large funds for the association.

The president elected to serve this association is not always as familiar with the transactions or scheme planned for conducting the work of this organization as he should perhaps be. This seems to me to be very essential, and I would suggest that it become the duty of the general secretary to acquaint the president-elect in a general way relative to the conduct of his office. The work of the numerous committees makes it possible to include practically every important suggestion the president contemplated embodying in his address. It is quite unnecessary to have duplication, and on the other hand he might deem it advisable to lend emphasis to some of their recommendations: I therefore suggest that the committees and chairmen of the different sections acquaint the president with the more important items of their respective reports some time prior to the annual meeting.

The work of the American Pharmaceutical Association is conducted largely through the council, special and standing committees and the sections. Recommendations for changes in by-laws, places best suited for meeting, cutting down traveling and hotel expenses, etc., have entered into nearly every presidential address, so I will refrain. The history and progress of the association and that of American pharmacy have been ably reviewed by many of my predecessors; I have accordingly contented myself with speaking of the aims, purposes and greater possibilities of association work, with the inclusion of references that had to do with the current year's activities.

I again express my sincere and grateful thanks for the preference shown me. My desire has not been for distinction, but rather that I might share in the work of my confreres in the American Pharmaceutical Association and contribute at least slight service to humanity.

G. M. Beringer, of Camden, N. J., moved that the address be referred to a committee of five, which was done, the committee consisting of G. M. Beringer, O. F. Claus, C. W. Johnson, J. O. Burge, and A. R. L. Dohme. The report of this committee was made at a later session.

RECEPTION OF DELEGATES.

Fred S. Carter, of Boston, was introduced as a delegate from the National Wholesale Druggists' Association. In responding he said that while his organization might be like Martha, and the one he was addressing like Mary who "hath chosen that good part which shall not be taken away from her," still, he suspected, that Martha had many times saved Mary from having to eat a cold dinner.

PROF. JOSE P. ALACAN.

University of Havana, who in the name of forty-odd Cuban members, invited the association to meet at his city soon.

President Eberle resumed the chair and introduced F. C. Godbold, of New Orleans, who spoke as a representative of the National Association of Retail Druggists. While that organization had not done all that was wanted, its accomplishments had been sufficient to make it pay to keep it up. Co-operation was better than competition; business friendliness was a tendency of the times.

Dr. R. A. Hatcher, of New York, spoke on behalf of the American Medical Association. There was no lack of appreciation on his part of the shortcomings of medical men, he said, and doubtless there were shortcomings on the part of pharmacists as well, but he would not attempt to discuss them before the American Pharmaceutical Association. He expressed the hope that each profession would solve its own problems.

At this point J. P. Remington introduced José P. Alacan, of the University of Havana, who was one of the two or three score of Cuban members of the association. Mr. Alacan read an invitation to the association to hold an early meeting at his city, signed by all its members resident in Cuba. This invitation was duly referred.

M. I. Wilbert, of Washington, brought the greetings of the surgeon-general of the United States public health and marine-hospital service, and added a few words regarding the great work of the service in the matter of controlling many contagious diseases. He spoke, too, to the bulletins on melting points issued by the service, and the bulletins it shortly would issue on the standardizing of digitalis and ergot. The work of the hygienic laboratory of their branch of the service in compiling digests of criticisms on the United States Pharmacopoeia and the National Formulary were well known to the members. The usefulness of the hygienic laboratory was limited only by the appropriations made by congress for its sustenance, and the association could do a service to public health by using its influence to have such appropriations made larger.

NOMINATING COMMITTEE.

Before adjournment for the day a recess of five minutes was taken, during which the members present from the

respective States, etc., named their representatives to serve on the nominating committee. These were as follows, each State being entitled to two members, if that many were present:

Arkansas, J. B. Bond, Sr., J. F. Dowdy.
California, Mrs. Fletcher Howard.
Colorado, C. M. Ford, S. L. Bressler.
District of Columbia, H. E. Kalusowski, M. I. Wilbert.
Florida, E. Berger, W. O. Richtman.
Georgia, George F. rayne.
Idaho, C. O. Ballou.
Illinois, G. W. Sohrbeck, C. H. Avery.
Indiana, J. V. Farbre, F. H. Carter.
Iowa, J. W. Ballard, W. J. Teeters.
Kansas, L. D. Havenhill, W. S. Henrion.
Kentucky, C. Lewis Diehl.
Louisiana, F. C. Godbold, Philip Asher.
Maryland, J. F. Hancock, W. C. Powell.
Massachusetts, J. F. Finneran, R. C. McGowan.
Michigan, H. B. Mason, E. J. Rodgers.
Missouri, William Mittelbach, O. F. Claus.
Nebraska, R. A. Lyman.
New Jersey, Charles Holzhauer, C. E. Vanderkleed.
New York, C. A. Mayo, W. C. Anderson.
North Carolina, E. V. Zoeller, E. V. Howell.
North Dakota, H. L. Haussemann.
Ohio, G. B. Kauffman, C. S. Ashbrook.
Oklahoma, H. D. Kniseley, J. C. Burton.
Pennsylvania, J. L. Lemberger, J. C. Wallace.
Rhode Island, James O'Hare.
Tennessee, J. O. Burge, W. R. White.
Texas, R. H. Walker, E. G. Eberle.
Washington, C. W. Johnson.
Wisconsin, G. V. Kradwell, E. G. Reuber.
Cuba, J. P. Alacan.

At large (appointed by the chair), J. P. Remington, of Philadelphia; L. E. Sayre, of Lawrence, Kan.; A. R. L. Dohme, of Baltimore; H. M. Whelpley, of St. Louis; and Francis B. Hays, of New York.

The formal naming of this committee brought the first session to a close.

SECOND GENERAL SESSION.

Tuesday Forenoon, August 15th.

President Eberle called the meeting to order at 10:15 A. M. Tuesday, and then was made the recipient of a gold-mounted and engraved gavel sent to him by his admiring fellow druggists of Dallas, the presentation being made in his usual happy vein by Mr. Remington.

This pleasant incident being over, it was announced that Secretary Caspari was somewhat indisposed, so H. P. Hynson, of Baltimore, acted as secretary pro tem.

NOMINEES FOR OFFICE.

H. M. Whelpley, for the nominating committee, an-

EX-PRESIDENT J. H. BEAL.

The new Secretary and Editor.

CHARLES CASPARI, JR.

Secretary of the Association from 1894 to 1911; now retired.

nounced that the committee had made the following nominations of officers for the year 1912-13, to be voted for by ballots to be mailed to each member of the association:

For president: W. B. Day, of Chicago; Charles Holzhauer, of Newark; and William Mittelbach, of Boonville, Mo.

WILLIAM B. DAY.

CHARLES HOLZHAUSER.

WILLIAM MITTELBACH.

The Three Nominees for President for 1912-13.

For first vice-president: José P. Alacan, of Havana; Charles M. Ford, of Denver; and Otto F. Claus, of St. Louis.

For second vice-president: R. H. Walker, of Gonzales, Texas; C. A. Mayo, of New York; and W. J. Teeters, of Iowa City.

For third vice-president: J. O. Burge, of Nashville; C. H. Packard, of Boston; and A. H. Clark, of Chicago.

For members of the council (three to be voted for): F. C. Godbold, of New Orleans; W. C. Anderson, of Brooklyn; G. B. Kauffmann, of Columbus, Ohio; C. W. Johnson, of Seattle; L. E. Sayre, of Lawrence, Kan.; E. Berger, of Tampa, Fla.; T. G. E. Otto, of Columbus, Ind.; J. C. Wallace, of New Castle, Pa.; and F. W. Meissner, of La Porte, Ind.

Council minutes were read by Secretary England.

In a letter from Oscar Oldberg read before the council, it was proposed that a new section be established, to be known as the section on United States Pharmacopœia. While this proposal was not endorsed in full, it led to the adoption of a resolution that special provision be made for meetings of the association's two committees devoted respectively to the Pharmacopœia and the National Formulary.

Mr. Beal announced that council meetings were open to all members of the association. Some members who had attended council meetings when a similar announcement had been made on a previous occasion were made to feel so uncomfortable that they did not remain long or return to another.

The minutes were approved as read.

SECRETARY'S REPORT.

Secretary Caspari's report on the financial accounts in his hands was read by Acting Secretary Hynson. A short abstract of this report follows:

National Formulary Account.

Receipts for the fiscal year.....	\$3,161.21
Disbursements, ditto.....	1,023.76
Balance	\$2,137.45
Total sales, ditto.....	\$3,758.36
Stock on hand, 1,094 copies.....	
Receipts since 1888.....	\$43,480.10
Expenses, ditto.....	22,634.02
Balance	\$20,846.08

TREASURER'S REPORT.

Treasurer Whelpley presented his report by title, but read in full the following addendum and summary of it:

Judged from the viewpoint of the treasurer, the success of the A. Ph. A. during a fiscal year is measured by the growth of the cash balance, the increase in membership and the condition of the special funds. This is the first time since 1900 that a fiscal year has occurred without an annual meeting. This condition has eliminated from our current expenses some of the items incident to an annual meeting and adds several hundred dollars to the apparent prosperity for the year. The available cash assets have increased \$1963.25 since my last report and amount to \$5701. This open account in the International Bank of St. Louis draws 3 per cent. interest on the daily balance and is compounded monthly. The amount on hand has not been considered sufficient to justify withdrawing a portion for investment in bonds.

The number of new members during the period from one annual meeting to another is reported by the secretary of the council at the closing session of each annual meeting. It must

be remembered that it has been fifteen months since the last meeting and that only nine months intervened between the 1909 and the 1910 meetings. The treasurer's records show 258 new members, compared with 406, the previous fiscal year. This decrease of 148 is explained by the fact that no annual meetings occurred in the period covered. The special membership campaign for the past year cost \$197.82, compared with \$337.96, the previous year. The membership roll is as follows:

Active members.....	2353
Life members.....	107
Life members, old style.....	24
(Do not receive the Proceedings, see Proceedings, 1885, page 525)	
Honorary members.....	3

Total 2490

The schedule of fees for life membership requires revision, as some fees are decidedly to the disadvantage of the association.

The special funds in the hands of the treasurer are of two kinds. One class is the property of the association and the other class of funds are held in trust to be expended under specific conditions. The five permanent funds, which are the property of the association, have increased \$1069.63 since my last report.

Life membership fees amount to \$75 and the contributions to the endowment fund, \$17. With these two exceptions, the growth of the permanent funds is from interest on the amounts reported one year ago. The number of funds held in trust has been augmented by the Hallberg memorial fund, which was started February 16th, 1911. The three trust funds amount to \$8424.61. This is an increase of \$4499.87 during twelve months. Of this amount \$4320.80 has been subscribed, and the remainder, \$179.07, is interest.

The association now holds \$15,701.08 in bonds and cash; \$29,623.37 of permanent funds and \$8424.61 of trust funds. The total amount is \$53,749.06.

The permanent funds on July 1st, 1911, are as follows:

	1910.	1911.
Life membership fund.....	\$17,319.85	\$17,964.68
Endowment fund.....	5,049.70	5,269.46
Ebert legacy fund.....	2,844.00	2,923.47
Centennial fund	2,413.67	2,501.20
Ebert prize fund.....	927.12	964.56

Total	\$28,554.34	\$29,623.37
		28,554.34

Net increase during fiscal year..... \$1,069.03

The association assets may be summed up as follows:

Cash in bank.....	\$5,701.08
Bonds	10,000.00
Available assets	\$15,701.08
Permanent funds.....	29,623.37

Total association assets	\$45,324.46
Hallberg memorial fund (held in trust)....	\$3,914.70
Procter monument fund (held in trust)....	4,478.91
College prize fund (held in trust).....	31.00
Grand total.....	\$53,749.06

The collection of the dues is a duty which demands constant attention. I have for three years followed the plan of prompt and systematic requests for payment and I find that members, who according to the old records were at times delinquent for three or four years, now pay promptly.

The addendum to the treasurer's report was provided for by a motion adopted at the 1903 meeting (Proceedings, page 117). The first addendum appears on page 35 of the Proceedings for 1904. It must be remembered that my statements necessarily refer to the condition of the finances and membership, July 1st, 1911. Owing to the date of the 1911 meeting, important changes have occurred since the close of the fiscal year. This is my third annual report, and I must again thank the officers and members for loyal support in the discharge of my duties.

The reports of these two officers were referred to the auditing committee.

WORK ON THE PHARMACOPŒIA.

Mr. Remington referred to the work of the committee of revision of the United States Pharmacopœial Convention,

saying that the committee had been in what might be termed "executive session" for a year or more, during which time it had almost completed its work on the scope of the next issue of the Pharmacopœia. In this connection he referred to the peculiar interest of physicians in this part of the work, and introduced the chairman of the sub-committee on admissions to and deletions from the Pharmacopœia, Dr. Solomon Solis Cohen,* of Philadelphia.

Dr. Solis Cohen was greeted by applause when he advanced to the front, his remarks were punctuated throughout by indications of approval, and when he had finished his remarks enthusiasm was at a high pitch.

DR. SOLIS-COHEN'S ADDRESS.

The Doctor began by saying that he spoke not as an official representative of the medical profession or of the committee of revision, but for himself alone, but he believed most of what he would say would be endorsed by his confreres. Instead of speaking on "The Scope of the United States Pharmacopœia," as had been announced, he preferred to entitle his remarks, "The Relation of the United States Pharmacopœia to the Practice of Medicine."

Few members of the committee of revision who had so gaily accepted assignments realized the burdens which they were assuming. In the revision committee there had been harmony as to scope, but differences of opinion and ideas as to details. The purpose of having committees rather than individuals to consider and decide these things was to elicit different views. In the committee on scope each member had been open to argument, but none was so weak as to yield simply to mere numbers. No errors appeared in the work of the committee as a result of neglect, carelessness or inattention, as all omissions and additions had been made deliberately after careful consideration. The work on scope was not yet complete, but had advanced to a point where definite action was in sight.

There was a tendency at the present time to decry the use of drugs in the practice of the healing art. There was hardly a subject on which so much nonsense had been spoken or written. True, it was an error to prescribe too much or unwisely, but it must be borne in mind that it is not the use but the abuse of medicine that is to blame for its ill effects. Both drugs and surgery were valuable aids in the hands of physicians, but both should be used understandingly. Neither the surgeon nor the general prescriber was exempt from the possibility of making an error, nor yet was the drugless practitioner of medicine. Rest cures were not so good as work cures in some cases. The future of medicine did not lie in physiologic measures any more than it did in drugs. On this subject he assumed to speak with some authority, as he had done something in physiologic practice. It was all right in its place; so were drugs; and so were mental suggestions and many other means used in practice. All were employed by good physicians. It was indeed a most unwise physician who would tie one hand behind him and then go into combat with death.

The infection known as medical nihilism had begun at Vienna and had found its best culture media in the colleges of medicine in France, England and the United States. Laboratory investigation alone, in the treatment of disease, was useless; clinical study at the bedside insufficient. The clinician and the pharmacologist were foolish to sneer at one another; each was necessary.

"Why," asked Dr. Solis Cohen, "does the young physician fall an easy prey to the 'detail' man?" And as he with his hand turned an imaginary crank, he imitated the phonograph-like talk of the agent of the manufacturing medical specialist, who tells the physician what to prescribe and how to prescribe it. He said that it was not the weapon itself, but a knowledge of how to use any weapon that came to hand that was of value to the soldier. If no rifles were obtainable, then an ability to fight with bows and arrows was desirable, and if there were no bows and arrows, commend him to the warrior who could win his combat with pebbles. "I take off my hat to the country doctor," said he, amid applause. "He is the man who knows from long experience what he can do to help the sick with simple measures—measures now called obsolete and useless by some. I have met the country doctor at the bedside and I know whereof I speak. When he reports that he has observed the patient and has applied a remedy I respect him and recognize his worth. He has been able by himself alone to produce results that I envy. I am not one to deprive him of the weapons that he knows

so well how to use." He said that in medicine and in Pharmacopœia-making, we should "prove all things" and "hold fast to that which is good."

Great strides had been made in medicine and in the curricula of institutions which taught medicine since Dr. Solis-Cohen was a student. Pathologists had returned to the teachings of the wise men of hundreds of years ago, but had a different nomenclature. While the old practitioners had had their "peccant humors," we had our "toxins." Just as we laugh at the older men, our grandchildren will doubtless laugh at our jargon. There is a "jargon" for each generation. Preventive medicine, with all its modernity is but a return to old practices; the fathers called it isopathy. The speaker did not like any "pathy," as those who strove to prevent disease and relieve suffering were not "pathists," but physicians. Our present-day advancement in medicine was due largely to the advancement of collateral branches of science. Titanus antitoxin would go into the next revision of the Pharmacopœia just as diphtheria antitoxin had gone into the last one. He wanted the United States Pharmaco-

HENRY M. WHELPLEY.

tion several "etc's."

JOSEPH P. REMINGTON.
He reported great progress
United States Pharmacopœia.

pœia to include every medicinal substance which can be used to advantage in the healing of the sick, new ones to be added as they appear. The official book must be broad, even though drugs are not the most important means employed to help patients. He favored the use of mental suggestion, but wanted it used with discretion and honesty. His quarrel with eddyism was not on account of the kind of treatment it employed, but because of its underlying fallacy and danger. Faith gave courage and strength and so is helpful in the treatment of disease. Neither did he object to Still's mechanical treatment, but to his ignorance of pathology, leading to its misapplication. In the same way he objected to drugs—the giving of too large or too small doses or the administration of the drugs that would do harm. The value of any kind of treatment depended on the sanity and knowledge of the practitioner using it, and year by year the knowledge of physicians is enlarged.

As a peroration he effectively quoted some lines from Gabriel Dante Rossetti in which is expressed in poetic language the idea that as we rise and advance new worlds open up to us.

When the loud and long applause following the delivery of this address had died down, F. E. Stewart moved that the thanks of the association be tendered to Dr. Solis-Cohen by a rising vote.

In seconding this motion J. F. Hancock spoke of Dr. Cohen's words as being instructive, sane and interesting. J. M. Good wanted to have them published in pamphlet form for general distribution among pharmacists and physicians.

John Uri Lloyd, of Cincinnati, said he would have come twice the distance he had traveled to attend the convention, just to have heard Dr. Solis-Cohen's argument for a cosmopolitan Pharmacopœia. He referred feelingly to his old teacher, Dr. Roberts Bartholow, and said that had he lived longer there would have been less unbalanced physiological investigation.

* See page 526.

Dr. Stewart's motion prevailed, unanimously.

In connection with Dr. Solis-Cohen's address, the following circular of the executive committee of the revision committee of the United States Pharmacopœial Convention, dated August 10th, 1911, is of especial interest:

ADMISSIONS AND DELETIONS.

The lists of admissions and deletions (Circular 149, pages 479 to 486) represent the articles proposed for admission and deletion and will form the basis of the United States Pharmacopœia, ninth revision. It is the first report of the executive committee of revision.

Some changes will undoubtedly be made before the publication of the work.

Comments will be referred to the executive committee for due consideration.

Respectfully submitted,
Joseph P. Remington,
Chairman of the Executive Committee.

Admitted to the United States Pharmacopœia, Ninth Revision.

New Articles Proposed for Admission to the United States Pharmacopœia (Ninth Revision.)

Ammonium Bifluoride.
 Antitetic Serum.
 Apol.
 Aspidospermine.
 Bismuth Beta-Naphthol.
 Buchu (Long).
 Caffeine Sodio-Benzate.
 Calcium Chloride (Hydrated Crystals).
 Calcium Glycerophosphate.
 Calcium Lactate.
 Carbonic Acid (Compressed).
 Condurango.
 Creosote Carbonate.
 Crocus.
 Diacetyl-Morphine.
 Diacetyl-Morphine Hydrochloride.
 Diastase.
 Emplastum Cantharidis.
 Erythrol Tetrinitrate.
 Fluorescein.

There are thirty-eight articles still under consideration for admission.

Edward Kremers thought that while the meeting was still under the spell which had been cast over it by Dr. Solis Cohen it was a good time for him to make a motion that less of the valuable time of the meetings be taken up with dreary and unnecessary details, and that more of it be devoted to such addresses as those present had just heard.

E. H. Bartley thought the committee on reorganization should take cognizance of this matter. The association agreed with Mr. Kremers.

In submitting his report as chairman of the committee on Procter monument fund, Mr. Hancock made a touching little talk on the life and work of William Procter. His report was accepted and the committee continued.

President Eberle announced that W. B. Day had been appointed on the syllabus committee to take the place of the late C. S. N. Hallberg, and that H. L. Taylor had been reappointed.

NATIONAL FORMULARY.

C. Lewis Diehl made his report as chairman of the National Formulary committee. It follows:

To the American Pharmaceutical Association:

Since the last report to this association the work of revision has been actively conducted, the correspondence requiring over 200 pages of bulletins, which were circularized to the members.

The conclusions reached through the medium of the bulletins, together with the conferences during the past few days at Boston, have enabled your committee practically to settle all pending problems.

While there yet may be found cause for a few changes in

EX-PRESIDENT C. LEWIS DIEHL.

Reporter on the Progress of Pharmacy from 1873 to 1891, and from 1895 to the present. Also Chairman of the National Formulary Revision Committee.

EX-PRESIDENT J. F. HANCOCK.

Leader of the movement to erect a monument to William Procter, "the father of American pharmacy," being chairman of the committee appointed for that purpose.

the lists which follow, they fairly well indicate the scope of the National Formulary IV.

The articles below, now included in the book, have not been admitted to the new edition:

Acidum Hypophosphorosum.
 Balsamum Traumaticum.
 Bismuthi Oxidum Hydratum.
 Boroglycerinum.
 Ceratum Camphoræ Compositum.
 Decoctum Aloes Compositum.
 Dextrin Emulsion of Cod Liver Oil.
 Elixir Acidi Salicylici.
 Elixir Ammonii Valerianatis et Quinina.
 Elixir Apii Graveolentis Compositum.
 Elixir Caffeina.
 Elixir Chloroformi Compositum.
 Elixir Cinchonæ, Pepsini et Strychnina.
 Elixir Coca et Guarana.
 Elixir Eucalypti.
 Elixir Euphonia.
 Elixir Frangula.
 Elixir Glycyrrhizæ.
 Elixir Grindelia.
 Elixir Malti et Ferri.
 Elixir Paraldehydi.
 Elixir Pilocarpi.
 Elixir Quinina et Phosphatum Compositum.
 Elixir Rhei.
 Elixir Rhei et Magnesia Acetatis.
 Elixir Stillingia Compositum.

 Petroxolin, Naphthol.
 Petroxolin, Phenol.
 Petroxolin, Tar.
 Petroxolin, Salicylated.
 Petroxolin, Camphorated Phenol.
 Petroxolin, Sulphur.
 Petroxolin, Sulphur, Compound.
 Petroxolin, Venice Turpentine.
 Pills of Digitalis, Squill and Mercury (Niemeyer's Pills No. 1).
 Pills of Opium, Digitalis and Quinine (Niemeyer's Pills No. 2).
 Solution of Aluminum Acetate Crude (Burov's Solution).
 Solution of the Bromides of Gold, Arsenic and Mercury.
 Solution of Coal Tar.
 Solution of Hydrastine, Compound.
 Solution of Pepsin, Antiseptic.
 Solution of Sodium Chloride, Physiological.
 Spirit of Ammonia, Anisated.
 Spirit of Vanilla, Compound.
 Spray, Eucalyptol.
 Spray, Menthol.
 Spray, Menthol, Compound.
 Spray, Thymol.
 Syrup of Ammonium Hypophosphite.
 Syrup of Blackberry.
 Syrup of Figs and Senna, Compound.
 Syrup of Iodo-Tannin.
 Syrup of Quinine with Chocolate.
 Sterilization (General article).
 Tincture of Cactus Grandiflorus.
 Tincture of Caramel.
 Tincture of Cocculus Indicus.
 Tincture of Ergot, Ammoniated.
 Tincture of Larkspur.
 Tincture of Opium with Saffron.
 Tincture of Passion Flowers.
 Tincture of Pulsatilla.
 Tincture of Saw Palmetto and Santal.
 Water, Phenolated.

Those articles used in the formulas of the National Formulary, but not standardized by the Pharmacopoeia, will be defined and included in Part II of the new book.

The following articles at present in the Appendix have been retained and will be included in the body of the book:

Antimonium Sulphuratum.
 Charta Potassii Nitratis.
 Decoctum Sarsaparillæ Compositum.
 Emplastrum Picis Burgundicæ.
 Emplastrum Picis Cantharidatum.
 Emplastrum Resinæ.
 Extractum Aconiti.
 Extractum Cinchonæ.
 Extractum Jalapæ.
 Extractum Podophylli.
 Fluidextractum Asclepiadis.
 Fluidextractum Aspidospermatis.
 Fluidextractum Castaneæ.
 Fluidextractum Colchici Radicis.
 Fluidextractum Dulcamaræ.
 Fluidextractum Gossypii Radicis.
 Fluidextractum Rumicis.
 Fluidextractum Scoparii.
 Glyceritum Vitelli.
 Hydrargyri Subsulphas Flavus.
 Infusum Brayeræ.
 Infusum Cinchonæ.
 Linimentum Sinapis Compositum.
 Liquor Ferri Acetatis.
 Liquor Ferri Citratis.
 Liquor Ferri Nitratis.
 Liquor Gutta-Perchæ.
 Magnesii Citras Effervescens.
 Massa Copaibæ.
 Mistura Magnesiae et Asafetidae.
 Oleum Phosphoratum.
 Pepsinum Saccharatum.
 Pilulæ Aloes et Asafetidae.
 Pilulæ Antimonii Compositæ.
 Pilulæ Rhei.
 Potassa Cum Calce.
 Potassa Sulphurata.
 Pulvis Antimonialis.
 Spiritus Myrciæ.
 Spiritus Odoratus.
 Syrupus Allii.
 Syrupus Althææ.
 Tinctura Bryoniæ.
 Tinctura Croci.
 Tinctura Cubebæ.
 Tinctura Humuli.
 Tinctura Ignatiæ.
 Tinctura Rhei Dulcis.
 Tinctura Sumbul.
 Trochisci Menthæ Piperitæ.
 Unguentum Plumbi Iodidi.
 Unguentum Sulphuris Alkalinum.
 Vinum Colchici Radicis.

Much care has been taken to insure careful and thorough revision; formulas have been studied and revised by sub-committees appointed for the purpose. Other sub-committees have submitted new formulas and every proposed change or addition has been published in the Bulletin together with comments or criticisms. Finally, in the light of these comments, a special reviewing sub-committee has passed upon the proposed formulas, suggesting further changes where found necessary, and then, with the approval of the whole committee, submitting the formula for drafting into manuscript.

It has been possible, through the settling at the recent conference of many minor questions raised by the reviewing sub-committee, to now place in the hands of the manuscript sub-committee almost all formulas, and it is confidently expected that the National Formulary will be ready for the press before the close of the present year.

Respectfully submitted on behalf of the committee, all (eleven) present at this meeting concurring.

C. Lewis Diehl.

This report was received and referred to the committee on publication.

H. L. Taylor, for the committee on rules for editing, made a report in which he recommended that the minutes of the meetings of the American Conference of Pharmaceutical Faculties and of the National Association of Boards of Pharmacy be incorporated in the association's volume of Proceedings. On motion of T. F. Main, of New York, this report was referred to the council without recommendation.

W. B. Day, chairman, reported for the general committee on membership as follows:

REPORT OF THE GENERAL MEMBERSHIP COMMITTEE.

After the death of Prof. Hallberg, which was a great loss to the committee and necessitated some changes in the plans for the Bulletin, your chairman deemed it advisable to cut down the expense of the membership campaign as far as compatible with an earnest effort to secure members.

Accordingly, the campaign started in January, 1911, with an appropriation of but \$200 to cover expenses. Your committee has been able to keep within this appropriation, as shown by the following statement of expenses. (Statement attached.)

In order to avoid the expense of employing the full time of a stenographer for this work, recourse was had to form letters, which were printed and the names inserted with a typewriter to match the print. In all six of these form letters were mailed. The usual lists were obtained from members of the committee and effort was made to secure as large a number of members as possible from these lists.

Co-operating with Mr. England, the acting editor of the Bulletin, a strong effort was made to interest the pharmacists of the United States army. A list of nearly five hundred of these military pharmacists was secured and two form letters were sent to them, along with a copy of the May, 1911, Bulletin, containing a special appeal to the military pharmacists by Chairman Payne. Up to the present time nearly seventy of the military pharmacists have joined the association, and no doubt more will join.

Your committee earnestly hopes that the association will find it possible to make a vigorous effort in behalf of the pharmacists of the army—an effort that will improve their condition both as to rank and pay and will increase the efficiency of the hospital corps of the army as a whole.

It is recommended that the committee on status of pharmacists in the government service take up this matter without delay, bearing in mind the fact that whatever is done must be

EXPENSES OF THE MEMBERSHIP CAMPAIGN FOR 1911.

Appropriation Number 29.....	\$200.00
January 1st to August 1st, 1911 inclusive.	
John Mors Co., printing, stationery and application blanks.....	\$39.25
John Mors Co., form letters (6).....	24.46
Postage.....	50.60
Salary of stenographer.....	35.00
Express.....	1.00
	\$150.31

BALANCE OF 1910 CAMPAIGN.

Summary.	May, June and July, 1910, Expenses.	Itemized as follows:
May \$53.00	Stenographer, 12 weeks.....	\$120.00
June 55.00	Postage.....	40.00
July 37.05	Rent of typewriter.....	7.50
	Incidentals.....	1.05
Total \$168.55		Total \$168.55

done with the consent and co-operation of the surgeon-general of the army and along the lines approved by him, otherwise it will come to naught.

It will greatly facilitate work of the committee if the action of the council requiring the endorsement of the member of the membership committee from the State or district from which the candidate for admission comes, is modified. Where this member has sent to the chairman of the committee a list of eligible pharmacists of whose election he is willing to approve, such candidates ought to be accepted upon the endorsement of the chairman. This will avoid delay and trouble. Also it may happen occasionally that it is not possible to secure the endorsement of a member of the committee from the State or Territory whence the candidate comes, for there may be no committeeman from that State or Territory. We have enrolled several members from the Philippine Islands, for example, and it was obviously impossible to secure the endorsement of a member of the committee in that district for this reason.

With the publication of the larger Bulletin it will be greatly to the advantage of the association to have the work of the general membership committee conducted from the office of the Bulletin, and if this is done larger discretionary powers might well be granted to the chairman of this committee.

An interesting feature of the membership campaign was the action of the council in sending Mr. Ralph Gable into the field to personally solicit members with the co-operation of the officers of the association. In Massachusetts Mr. Gable secured quite a number of new members, but the expense was rather high and it was thought best not to continue the campaign in this direction until a more favorable time.

The activities of the New England members have resulted

in a very large accession to our membership from this section. President Eberle has brought in a great many Texas members, and the efforts of Prof. Remington and Prof. Alacan have resulted very successfully in bringing into the association a considerable number of Cuban pharmacists. The various State association meetings have also been productive, notably in South Dakota, Maryland and Nebraska. Taken in all, the membership is growing in a fairly satisfactory manner.

The secretary of the council reports a number of members elected since the Richmond meeting. The secretary of the association, no doubt, can give us the exact membership at the present time.

As reported in the last Proceedings the membership was 2423, including 141 life members, but excluding the honorary members. The growth of the membership for the past sixteen years gives evidence that the association has passed a critical point in its history and that a steady increase in members may be looked for from now on. The lowest point was reached in 1900 when the Proceedings shows but 1237 members, thus indicating that within the last twelve years the membership has been doubled. This surely does not look like "the sick A. Ph. A." that we heard about last winter.

With the prospect of a greater Bulletin and a thoroughly organized effort to interest the pharmacists throughout the country as well as in Canada, Mexico, Cuba and the West Indies, great strides forward should be assured.

Your chairman desires to take this opportunity to thank the members of the committee who have seconded his efforts so effectively, as well as the acting editor of the Bulletin, who has faithfully co-operated in the good work and is deserving of much credit therefor.

W. B. Day,
Chairman.

Chicago, August 11th, 1911

On motion of Mr. Whelpley, the thanks of the association were tendered to Mr. Day for his excellent results achieved at a small expense.

The session then adjourned.

SECTION ON COMMERCIAL INTERESTS.

Tuesday Afternoon, August 15th.

On account of the regrettable and unavoidable absence of Chairman F. M. Apple, who had been called from Boston to his home at Philadelphia, Associate E. Berger, of Tampa, presided over the deliberations of the commercial section, calling its first session to order in the large meeting room, Tuesday afternoon. Secretary B. E. Pritchard, of Pittsburgh, was present and officiated. The chairman's address was read by Mr. Berger.

SUNDAY CLOSING.

Sunday closing was the first topic for discussion and brought forth many recitations of facts and expressions of opinion.

F. M. APPLE.

Called from the meeting before the opening session of the Section on Commercial Interests, of which he was Chairman.

E. BERGER.

The new Chairman of the Section on Commercial Interests. Very active in Board Association matters.

The way to close on Sunday, believed C. B. Lowe, of Philadelphia, was to close, regardless of whether others agree to do so or not. He had followed the plan and found that while he might lose many sales on Sunday, in the year's business he lost nothing, and gained much rest and self-respect.

F. H. Carter, of Indianapolis, had observed that many Sunday sales in drug stores were of articles which were ordinarily kept in grocery stores and were bought in the grocery stores during the week.

H. M. Whelpley, of St. Louis, said that when he was a drug clerk his hours were from 1 to 5—that is, from 1 A. M., when the store was closed, to 5 A. M., when it was opened again. He did not aver that these were the exact

hours every day, but only approximate. He thought each druggist should act on his own initiative in the matter of closing, without waiting for general action.

F. E. Stewart, of Philadelphia, had tried Sunday closing and had found that it paid.

J. B. Bond, Sr., of Little Rock, had observed that keeping open on Sunday was the result of avarice on the part of the man who did it. Soda water was sold on Sunday simply to make money for the seller—nothing more.

Charles Holzhauer, of Newark, had been in business continuously since 1853; had never kept open on Sunday and never would. If he could not make a living in the drug business by working six days in the week, as other men did, he would quit it. A friend of his in the drug business had told him that he was making a great mistake by closing on the best day of the week for business. The friend had died a bankrupt. He knew that he could do a big business on the Sabbath, but believed that proprietors as well as clerks were entitled to their day of rest. He found that he could keep a better class of clerks by closing one day in the week, and his standing in the community was higher. He opened for filling prescriptions two hours twice a day on Sundays, just to show his customers that he was not indifferent to their needs. There was compensation somehow along the line for the man who refused to commercialize the Lord's day.

H. P. Hynson, of Baltimore, saw three sides to the Sunday-closing question, the moral, the humanitarian, and the business. Times had changed, and there was less reason for keeping drug stores open on Sunday now than formerly.

H. D. Kniseley, of Checotah, Okla., never kept open all day on the Sabbath during the twenty-two years of his ownership of a drug store. He had kept one clerk ten years.

F. E. Stewart read a paper on patents as applied to medicinal preparations, which led C. B. Lowe to refer to the difference in the price and in the way a patented drug is advertised to physicians before and after the expiration of its patent. A general discussion of the patent law ensued, in which Mr. Stewart stated that many of the claims made by patentees of medicinal preparations would not hold good if tested by the law, being purely "bluff."

B. E. Pritchard, of Pittsburgh, read a paper, which is here given in full:

Business Hints from the Department Stores.

BY B. E. PRITCHARD.

"Do men gather grapes of thorns, or figs of thistles?" Most assuredly they do not. Neither do men gather success of slipshod, careless business methods.

No business that is not wisely planned and thoughtfully carried along upon systematic lines can ever grow big enough to attract attention. We are urged not to despise the day of small things, and men in business life should likewise cultivate the habit of refraining from speaking disparagingly, judging evilly, the ways of large concerns that have grown big because of the care and attention the men at the top have given to little things in a large way.

The question is frequently propounded in a peevish manner, "What is the matter with the drug business, any way?" The only correct reply is, "Nothing that is not the matter with any and every other line of business."

What prompts this query? The condition in which the querist finds himself when he has seen other men outstrip him in the building up of a big, flourishing mercantile establishment, directly under his eyes, and in the same field where he himself has proven a failure.

In every such instance careful, analytical investigation into reasons will reveal the truth, that it has been due to faults in the man who failed that were avoided by the man who succeeded. The failure simply eliminated himself from the game by ignoring its rules.

Using our own calling merely because it comes closer home to us, it can be repeated and emphasized: There is nothing whatever wrong with the drug business.

That there are numerous things wrong with a good many men who are druggists, however, cannot be so easily disposed of, or so effectually dismissed from our calm consideration.

There are great educational institutions in this country that have been founded and are being carried on for the one purpose of teaching men the science of business-building. Mr. Sheldon, who is a leading apostle of this gospel, says: "Let us begin our consideration of this theme by an analysis—science, every practical American

citizen has defined as classified common sense." Business-building Mr. Sheldon defines to be the art of procuring permanent and profitable patronage. Thus he declares, "Success, commercially, hinges upon the power to make permanent and profitable patrons, and this is true no matter what line of business one is engaged in."

We have now arrived at that point in this paper where the roads diverge, some leading to success, others to failure on the business highway. The sign-boards point accurately enough—no man need err therein—but the roadways are not equally inviting; hence some travelers disregard the signs and jump the fences in a resolve to reach the goal by a cross-cut—and never get anywhere. Others, with only a single eye looking to success, keep on the right road, climb over the obstacles, disregard the handicaps, patiently moving on day after day, and in the end become business barons, while those who would not consent to bear the burdens for a time, but chose rather to shirkingly skip across lots, refer to them as "lucky fellows," oftentimes adding the gratuitous information that they, too, could have "got there" if they had not been so honest in their dealings, and thus hint at questionable methods practiced by the successful one.

There may be, possibly there are, some methods employed by those who carry on big enterprises that may not be thoroughly in accord with our ideas of the eternal fitness of things; but are we ourselves so utterly free from the commission of unwise acts, so entirely void of all ugly characteristics in our make-up, that we would make acceptable patterns for the Almighty One to mould all men in our image?

I have known druggists who after being careful to make a quotation on the price of a prescription ten cents below the indicated figure, as expressed by the N. A. R. D. symbols placed thereon by his neighbor, to proceed to anathematize the big down-town department store for demoralizing prices. It all brings to mind the story of the old-time store-keeper who upon a sharp cold morning called to his apprentice boy: "John, have you sanded the sugar?" "Yes, sir." "Watered the vinegar?" "Yes, sir." "Chicoried the coffee?" "Yes, sir." "Well, John, you can now put another dollar on the price of a ton o' coal, and then hurry in to family prayers. God help the poor on a cold day like this."

Enough now, for the purpose of exordium; let us get down to the root of the matter in hand. I do not intend that this paper shall deal with men's weaknesses; my purpose is to endeavor to call attention to some lessons that can be learned from a study of some of the big store methods of conducting business.

An instructor in one of our schools of pharmacy not long ago was talking to me of a young drug clerk who was seeking employment. Among other things he said: "He was employed by the Blank Drug Company, but quit there because he was held down to so many red tape rules." And he added sneeringly: "Those people are awfully small."

"No," I corrected him, "the trouble does not lie in that direction. That store is conducted systematically and according to certain clearly defined rules, and each employe is expected to abide by them. This young man has, unfortunately, been accustomed to working in drug stores that are run on the hit-or-miss plan, and when he is subjected to properly systematized business methods he rebels, that's all."

It has been my good fortune to be on terms of good fellowship with at least one set of men who conduct a very large retail drug business, and I have been permitted to gain much insight into their methods; and as they are the methods employed in all properly conducted retail business firms, they will well repay mentioning in this paper which will be read by thousands of druggists all over this great country, as well as other countries, and may, I sincerely trust, bear much good fruit.

Each employe upon entering or leaving the store must record the fact by the use of a time clock that has been installed for that purpose.

Every employe who sells goods must make a record of each sale and hand it to the cashier who deposits it in its proper place, so that every day the sales manager has accurate knowledge of what every salesperson has done during that day; and thus the exact value of each employe to his employer is known. When conditions arise that necessitates a reduction of the working force the manager knows just who should go and who should be

retained, and, again, these records are ready of access when promotion is to be made.

Not one penny's worth of merchandise is permitted to pass over the counter without its price in full has found a place in the cash register. This rule applies all down the line from proprietor to humblest employe. I have been invited at times to be the guest of the proprietor at his own soda fountain, and invariably he has paid the check handed to him by the dispenser, just as every other customer did. I have been with the proprietor when he has stepped up to his own cigar case for cigars. He was treated by the clerk exactly as though he were a complete stranger—paid for what he received.

Is there one proprietor of a drug store listening to this reading who can truthfully say, "None of these things move me?" Does this careful attention to small things mean much or little, when weighed in the balance, between success and failure? I have known proprietors who have made it a rule when engaging new clerks to inquire closely into the habits of the applicant, and if he was not a smoker that fact added an appreciable sum in the appraisal of his value as an employe.

The firm under consideration always has a thorough and complete understanding with each employe concerning hours of service, and this is kept inviolate. Once each week employes are given a full two hours' freedom from the store, in addition to whatever arrangements are entered into covering Sunday service. The employing manager assures me that his experience has convinced him that a continuous grind weakens any man's hold upon business.

A peculiar feature about the conduct of a large retail business is the fact that neither the proprietor nor any of the men near the top in the management of the business have any personal acquaintance with the store's patrons. The business is kept moving along in a manner similar to that of a general in command of a large army. This proves conclusively that it is not essential for the proprietor of a successful store to come into personal contact with his clientele. In fact, a large and successful business can not be built up upon such a hypothesis. A business the continued success of which is contingent upon the personality of one man constitutes a very unsatisfactory asset. Such a business when thrown upon the market for any cause can not, in the very nature of things, command a high selling value. You can not transfer your personality to another. The moral is self evident. Do not nurse your customers by being always in evidence every time they enter your store. Get out. See things. Learn other men's methods. Teach your employes to treat your trade in such a satisfactory manner, whether you are present or not, that they will bind their patronage to that store with bands of steel. It does not make a ripple in the onward movement of trade in the big store whether the proprietor is at home or abroad, and, in fact, 90 per cent. of the store's patrons do not know who is the owner.

To my mind, and I have preached this doctrine before, it belittles a man in the eyes of thinking people to be always found sitting closely upon one egg. It broadens a man in his customers' esteem if at times his employes can say to those who seek the proprietor, "Mr. Blank is not here to-day, his other interests demand his attention for a time." Can't you see how that proprietor will at once be seen through different eyes? He is not only the little druggist on the corner; he has outside interests that claim him beside this one small holding. Do you catch my meaning?

Another feature in connection with the conduct of a large store that, to my mind, is worthy of consideration, is the fact that the selling end is not paramount in organizing for action. The men who are in business to make money in a large way in retail merchandising give but little thought to the organization of their selling force. That detail is left to the care of a general sales manager who is held to a strict accountability for the output. As a matter of fact there are persons in the employ of some large retail establishments who do not even know the owner or owners by sight. The high salaried, valuable men whose duties are the obtaining of supplies at right prices, whose business it is to know best sources of supply, are the men who stand nearest the throne. Salespeople are always to be found lying in wait; they can be picked up in a minute or two, and at small pay; but with buyers conditions are vastly different. A reliable man with proper knowledge of the line of merchan-

dise seeking his services can always command a salary, and is seldom found offering his services; he is sought for far and wide—his value to employers is a known quantity.

The public knows its wants, and a very mediocre person can hand over the commodity asked for, but the ability to provide for this demand satisfactorily, both in quality and price in such a manner as to never disappoint purchasers, is found in but rare instances, and when found is liberally rewarded. Hence the buying of merchandise aright is the thought always uppermost; the selling end takes care of itself.

In the arranging of a department store on a big scale every foot of space is expected to pay a profit. Rent, light, heat and every expense properly chargeable is set down against each foot of space, and these must all be paid for and a profit shown. If one line of merchandise is found to be occupying more space than its earnings justify, it is at once shortened to fit into its earning capacity. I once called the attention of the manager of a very large retail drug store to the fact that his soda-water department was apparently inadequate, for there were as many patrons standing around awaiting service as were being served. "No," he said, "that department is crowded for but an hour or two each day. At other hours it is quite adequate to the demands. It is now occupying as much space as its earnings justify. The question is elimination." How many proprietors of drug stores are there here listening to this reading who have so close an insight into their soda water departments, or, in fact, any single department of their store?

I one day ran into the head of a retail drug merchandising concern that is doing an annual average business of approximately half a million dollars. In his hand he carried an account book with which he was moving about the establishment making notes. "Why," I exclaimed, "you seem to be working. I thought you had passed all that sort of thing along to others." "Not all of it," he said, "this one thing I have reserved for myself." Thereupon he showed me the nature of the entries in his book. These consisted of the date of each day in the year, together with temperature and other weather conditions, followed by a statement of the day's sales in each department. "Now," he said, "I have similar entries for every day of this store's business life. I take this day's exhibit and carefully compare it with the corresponding date of one year ago. If I find that weather conditions, etc., are practically the same, and yet any department has failed to measure up to or beyond the volume of business done, I immediately call upon the manager of that department for a reason why, all things else being equal, his sales have fallen down. This enables us to learn where the weakness lies, and we proceed at once to repair the trouble. Business must increase, not decrease each year; we cannot afford to stand still, much less go back."

Does that man stand very greatly in need of a course in the science of business building, think you?

With these few inside views of how big retail stores are carried on, look over the history of your store; compare these systematic methods of taking care of business with your methods. Do yours measure up to the needs of a healthy continuous growth of permanent, profitable patronage?

Are you using science in the manner in which it is defined earlier in this paper, viz., as "classified common sense" in your business building? Without doubt there are many men engaged in the merchandising of drugs who do use every means at their command to make their stores successful, but they are not to be found among those who are dolefully propounding the question, "What is the matter with the drug business, any way?"

F. E. Stewart characterized Mr. Pritchard's contribution as a valuable paper, but as other papers were to be read and the time was short, no extensive discussion of it was indulged in.

The next paper, in the absence of its author, was read by J. W. England. It follows:

Factors to be Taken into Consideration in the Extension of Credit.

By C. MAHLON KLINE.

Credit is the backbone of modern business. With it, a man can command more capital, do more business and make more profit. The advantages of credit, or rather its

possibilities, when properly used, are so generally recognized in the business world, that it has often been a question in the mind of the writer why more retail druggists did not avail themselves of it, especially in the direction of obtaining loans to discount bills, by which they could obtain a much larger rate of interest on their money than the rate charged for the loan.

Generally speaking, there are three factors to be considered in the extension of credit; capital, capacity and character. To the student of credit conditions this statement is elementary, but to those of you who have not made credit a special study, it may be of interest to explain the relative importance of these factors. Credit may be extended on the strength of the existence of any of them, but in no case can it be extended where all three are absent.

You may not be aware of the fact, but capital alone, regardless of character and capacity, entitles the possessor to credit in reasonable amounts. A man notoriously dishonest, and of no ability, provided he has a clear title to valuable property, can secure credit more easily than a man without capital and of admittedly good character. The reason for this is, of course, obvious. The laws of the country are so drawn that the creditors run a better chance of securing their money, if necessary, where capital is in existence, than they do where the ability to earn capital may be present, but which remains to be demonstrated. For this reason we very often see the example of a man without capital obeying moral laws and conducting himself in a decent Christian way, simply and solely because he realizes that in the absence of capital he must demonstrate character. Very often this same man, after his career has been crowned with wealth, will forsake utterly the principles that have guided his steps, and will attempt to defy moral laws and put aside Christian virtues, because he vainly imagines that his wealth places him beyond the control of the laws of God and man; and indeed, we are daily accustomed in these modern days to the spectacle of such a man continuing to live as he sees fit without the loss of either commercial power or wealth.

To turn to the second factor, that of capacity; capacity without capital, but with character, is an exceedingly important consideration in the retail drug business. The business is of such a nature that not very much capital is required, and if a man whose capacity is known, and whose character is above reproach, comes to a supply house the credit extended to him is often surprisingly large. On the other hand, capacity without character or without capital may be of value when properly controlled, but it is very seldom that a man of this kind meets with any measure of business success. Credit men have a little habit of inquiring into the character of the individual, and where wine, women and song are indicated, the individual receives scant consideration. I have known credit to be refused on immorality alone, simply because it is well known that immorality quickly undermines character and leads to financial downfall.

One of the misfortunes of the retail drug business in the past has been the fact that retail druggists knew little or nothing of the economic principles of the business world, and tried to do business by ignoring them. Today, under the leadership of the national pharmaceutical organizations, this condition is being rapidly changed. Furthermore, the colleges of pharmacy are seeing the signs of the times, and are giving special courses of commercial training to their students, a practice which cannot fail to make good business men as well as good professional men.

An able credit man has to take chances. He has to trust often largely to instinct, and is, of course, often sadly misled. It is very necessary, however, that he take risks, or else he will not be making the best of the possibilities of his position. The credit man who has no losses is not a good credit man; it means that he is losing more business than he should. In modern business, losses up to a certain point are considered perfectly legitimate. If the labors of a credit man selling as he does in the territory within a radius of some hundred miles, are trying, how much more trying must they be to those who sell in foreign lands, more particularly those lands which are constantly in the turmoil of political upheaval, where a man may be a millionaire one day and a beggar the next. Those who sell goods in South American countries are particularly exposed to this sort of risk. Often a shipment is started to a man having the best of credit, and

while the shipment is on the way this man's capital and belongings are wiped out of existence and his bills remain unpaid.

It seems peculiar, but nevertheless it is a fact, that when once financial institutions form the habit of extending credit to an individual or company it is easier for such to continue borrowing than it would be had they never before asked for such an accommodation. To illustrate my point: I quote a peculiar case that came to my attention of a man conducting a business that had so much capital and the earnings of which were so large that they were never accustomed to ask for loans of any kind, but paid dividends and discounted all bills with cash at the banks. This man found that he could use \$10,000 to advantage, and went to one of the banks where he had maintained a cash deposit for years, and asked for a loan. The bank immediately began to ask him questions which made him so angry that he advised them to depart for a certain place where the climate is said to be hot, and went to another bank, where he was accustomed to keep, also, a considerable cash deposit. This bank treated him no better than the first, which so annoyed him that he decided to go no further.

Where banks are accustomed to extend credit they will frequently loan large amounts on short notice. Where a company has existed for years without borrowing, any attempt to borrow immediately arouses suspicion. It is, therefore, undoubtedly good practice for a man, or company, to borrow money, from time to time, just to get the financial community accustomed to loaning to him.

The factor most considered by banks in the extension of credit are the quick assets. Quick assets consist of stocks which have a fixed market value and can be disposed of at short notice, accounts receivable which are due from customers in good standing, and, of course, cash on hand in the bank. Many other assets which might be considered excellent cannot be taken into account, because they are of such a character that should the bank come into possession of these it might take considerable time and expense before they could be converted into cash.

In order that it might be considered in connection with Mr. Kline's paper, the next one was read by Mr. Saalbach before any discussion of the preceding one was called for. Its author was not at the meeting:

The Druggist's Strongest Asset—Credit.

By JOHN R. THOMPSON.

You might have \$25,000 in the bank and still not be considered a desirable customer of merchants and manufacturers. On the other hand, your bank balance may be very small and cause you no embarrassment if you are prompt in paying your bills. A strong credit is built up by the method you employ in making settlement and not by a strong showing in assets.

A bank will lend money and a merchant will give credit more readily to the druggist who has a reputation for

Good credit is more to be desired as it is more useful to the business man than lots of prosperity.

The firm who sells you goods is not interested in what you are worth, particularly, but they are alive indeed to whether you do not pay when your bills are due.

The proportion of druggists who discount their bills is larger than one would suppose at first thought. It varies in different localities like everything else. In Pittsburgh about 80 per cent. of druggists discount; in Philadelphia about 60 per cent.; in New York 60 per cent.; in Boston 80 per cent.; in Baltimore 50 per cent.; in Chicago and most Western cities about 75 per cent. Cleveland and Cincinnati both in the same State vary from 80 per cent. in the former city, to 65 per cent. in the latter.

These estimates apply only to city druggists. In the country districts the proportion is larger in the West and smaller in the East.

Taken as a general average we will say about 70 per cent. of druggists discount promptly. This a good showing compared with other business of comparative size. Grocers and other merchants do not discount in any such proportion. Department stores with scarcely an exception discount all bills.

The merchants in all lines who discount are the ones who are making money. Those who do not are the ones who simply exist or fail.

This is easily accounted for; the man who is prompt in payment is also prompt and forethoughtful in all his actions. He is a good buyer and will not overstock. He is a good salesman and will get rid of goods somehow which have ceased to be good sellers; he is a good manager and will not allow extravagance and negligence to escape notice. He is a good business man all around because he discounts. He discounts because he is a good business man.

The direct profits to be made by discounting aside from establishing credit are large in themselves.

A druggist purchasing \$10,000 worth of goods a year will realize a hundred dollars if cash discounts are only one per cent. and in many cases they are two and three per cent. To clean up a hundred dollars net by selling goods you must sell about a thousand dollars worth of merchandise.

The advantages of discounting, therefore are: the direct profit in it, the building of credit and the acquisition of good business habits. These three qualities will make a business a success anywhere in the world.

Thomas F. Main thought the drug business was to be congratulated upon the large proportion of its members who discounted their bills; it showed prosperity.

OLONIUS REVERSED.

Charles Holzhauer had found that it paid to borrow money. "Borrow," he said; "discount, pay back, and borrow some more."

A. W. Miller, of Philadelphia, agreed that borrowing was a good thing, and H. B. Mason observed that druggists did not use the banks enough. The way to make money, he had found, was to borrow at 5 per cent. and make the borrowed capital earn 15 per cent.

S. H. Scallin, of Mitchell, S. D., believed that some borrowers resented the inquiries made of them by the banks. It was the business of banks to know what was to be done with the money borrowed, as it was money held in trust for depositors and the banks were obliged to be careful with it.

CO-OPERATIVE INDUSTRIES.

Associate C. M. Ford took the chair while Mr. Berger presented a paper on co-operative cigar manufacturing which had been prepared at the request of Chairman Apple. In this paper he told of the advantages of Tampa as a cigar manufacturing center, and the money that had been made in the business there.

Frank H. Freerichs, of Cincinnati, was a believer in co-operation effort, and would like to see Mr. Berger encouraged.

"Personality in Pharmacy" is the title of a paper presented by P. Henry Utech, of Meadville, Pa.

Other papers on the program, not all of which could be read on account of lack of time, were:

"A Neglected Asset," by J. J. Bridgeman, of Philadelphia.

"Simplified, Accurate Methods of Recording Charge Sales," by Ambrose Hunsberger, of Philadelphia.

ELIE H. LAPIERE.

One of the local men who did much to help entertain the speaker of the Association, men visitors, while his wife whose eloquence takes the and daughter were similarly body to Denver next year; second engaged with the women.

CHARLES M. FORD.

Champion three - minute Vice-President.

prompt payment even though he may be only moderately rated, than to the man of reputed wealth who is slow to liquidate.

"Principles and Practice of Bookkeeping," by H. P. Hynson, of Baltimore.

"The Cost of Conducting the Drug Business," by E. Fulderton Cook, of Philadelphia.

"Pharmaceutical Window Displays," by Otto Raubenhimer, of Brooklyn.

"The Advantages of Maintaining a Luncheon Room for Employees of Pharmaceutical Manufacturing Establishments," by W. A. Pearson, of Philadelphia.

"The Drug Store Crisis," by C. M. Ford, of Denver.

"Some Everyday Problems," by C. B. Lowe, of Philadelphia.

Officers elected as set forth on page 492, were installed, after which the section adjourned.

SECTION ON EDUCATION AND LEGISLATION.

First Session, Wednesday Forenoon, August 16th.

After calling to order the first session of the section on pharmaceutical education and legislation Wednesday at 10 A. M., Chairman C. W. Johnson, of Seattle, Wash., called upon Associate Philip Asher, of New Orleans, to preside while he read his address.

Two things strongly urged by the chairman were (1) a more thorough and practical curriculum for schools of pharmacy, including drug store practices, even advertising, window dressing, and making soda water, if need be, and (2) the making more nearly uniform of pharmacy

CHARLES W. JOHNSON.

Retiring Second Vice-President; Retiring Chairman of the Section on Education and Legislation.

WILBUR J. TEETERS.

Re-elected Secretary of the Section on Education and Legislation.

laws. Pharmacy, he said, was the same in all States, and asked why the laws which govern its practice should be so widely different. The "prerequisite" idea, he noted, would not down, and a model "prerequisite" law was desirable.

This address was referred to a committee of three, consisting of H. P. Hynson, W. C. Anderson and H. L. Taylor, with instructions to report portions of it to the conference of faculties and other portions to the association of boards.

Thomas P. Cook called the attention of the section to the fact that President Seth Low, of the National Civic Federation had appointed a committee of members of the American Pharmaceutical Association to help bring about an improvement in the quality of food and drugs sold in this country. (See the CIRCULAR for last month, page 440.) The committee consists of E. G. Eberle, H. H. Rusby, C. F. Chandler, Thomas P. Cook, and Thomas F. Main.

Secretary W. J. Teeters, of Iowa City, submitted his report for the year. It is here given in full:

REPORT OF THE SECRETARY OF THE SECTION ON PHARMACEUTICAL EDUCATION AND LEGISLATION.

The annual reports of the secretary of this section are, in effect, a running account of the nation's progress in education and legislation in pharmacy and should, at least, show two things: first, the trend of legislation, and second, the advance in education in pharmacy.

In legislative matters the pharmacists themselves must meet the responsibility placed upon them by a protected profession, or expect measures to be introduced which are inimical to their interests and the best interests of the public. Legislative committees from the State associations are, as a rule, on the defensive. They should be on the firing line. Too few pharmacists take an active part in politics, and

our weakness in organization has been many times demonstrated when important measures were pending in the various legislatures. Every county should have its organization, and every pharmacist should belong to his county, State, and the national associations. No man should be allowed to join the national association until he had joined his State association, and membership in his county association should be required before he could become a member of the State association. With such an organization the absurd bills, even if introduced, would never become laws. Such a scheme of organization is not visionary, but on the contrary, is logical and practicable, and is, I believe, the only solution by which some of the perplexing problems can be successfully met.

The legislatures in the following States did not meet this last year: Arizona, Kentucky, New Mexico, and Virginia.

In the following States no changes in the pharmacy laws were made, although in a number of the States bills were introduced but failed to pass: Alabama, Arkansas, District of Columbia, Florida, Georgia, Idaho, Kansas, Delaware, Louisiana, Maryland, Massachusetts, Maine, Nevada, New Jersey, New Hampshire, Nebraska, Rhode Island, South Carolina, South Dakota, Oregon, Texas, and Wyoming.

Pre-requisite bills failed in Illinois, California, and Washington.

State Laws and Bills.

California: A new poison law was adopted which includes the following peculiar features:

It shall be the duty of the State board of pharmacy to adopt a schedule of what in their judgment are the most suitable common antidotes for the various poisons usually sold. The particular antidote adopted (and no other) shall appear on the poison label provided for in section 2 of this act, or be attached to the package containing said poison. The vendor of said poison may enter the same in any foreign language he may desire, in addition to the said entry and label in English.

When in the opinion of the State board of pharmacy, it is in the interest of the public health, they are hereby empowered to further restrict, or prohibit the retail sale of any poison by rules, not inconsistent with the provisions of this act, by them to be adopted, and which rules must be applicable to all persons alike.

The possession of pipes used for smoking opium (commonly known as opium pipes) and the usual attachments thereto is hereby made a misdemeanor and upon conviction thereof shall be punishable by the penalties prescribed in section 7 of this code.

All narcotic drugs specified in section 8 and also all pipes used for smoking opium (commonly known as opium pipes) and the usual attachments thereto, seized under the provisions of this act shall be ordered destroyed by the judge of the court in which final conviction was had; said order of destruction shall contain the name of the party charged with the duty of destruction as herein required.

The sale of carbolic acid in quantities less than one pound is prohibited unless upon the prescription of a physician, but this prohibition does not apply to solutions of carbolic acid containing not over 10 per cent. of carbolic acid and not less than 10 per cent. of ethyl alcohol.

The penalties for violation of the narcotic sections of the act are as follows: First offense, fine \$100 to \$250 or imprisonment not more than 100 days; second offense, fine \$250 to \$500 or imprisonment not more than 200 days; third offense, imprisonment from one to five years. It will be noted that for the third offense no fine is provided, but only imprisonment for a period about the same as usually applied in cases of second or third degree murder.

The penalty for violation of other sections of the act are fine \$30 to \$100 or imprisonment for not more than 50 days.

An amendment to the criminal code of the State provides that any one addicted to the intemperate use of narcotics may be confined in the State Hospital for the Insane for treatment upon the order of a judge after trial. Any one may cause the trial by making affidavit as to the accused condition.

Colorado: The following cocaine law was passed and approved May 30th, 1911.

Section 1. It shall be unlawful for any person to sell or offer for sale, give away, or offer to give away, buy or offer to buy, receive or offer to receive, any cocaine or its salts, alpha or beta eucaine or their salts, or any compound mixture or solution or other product whatsoever of which cocaine or any of its salts, or alpha or beta eucaine or any of their salts is a constituent or ingredient, except as hereinafter provided.

Section 2. Any registered pharmacist or pharmacist (?) may dispense any drug, compound mixture or solution or other product mentioned in section 1 of this act, upon a written prescription of a duly registered physician, veterinary surgeon or dentist, which prescription shall be retained in the pharmacy, drug store, dispensary, or sanatorium or hospital in which the same was dispensed by the proprietor or manager thereof; said prescription shall be filled but once and no copy of it shall be taken by or furnished to any person except the same be required for the enforcement of this act.

Section 3. Any manufacturer, any wholesale druggist, any retail druggist, actively engaged in business may sell any item mentioned in section 1 of this act to any such manufacturer, wholesale druggist, registered pharmacist actively engaged in business, to any duly registered physician, veterinarian, or dentist, duly authorized hospitals, dispensaries, sanatoria, provided that before delivering same they shall make or cause to be made in a book kept exclusively for that purpose an entry of the sale, the name of purchaser, date of sale, the quantity, name of article sold and name of person by whom sale is made; said

book shall always be open for inspection at reasonable time to any member of the State board of pharmacy, State board of health, food and drug commissioner, or any inspector of food and drug commissioner or State board of pharmacy; said book shall be preserved for five years after last entry was made.

Section 4. It shall be unlawful for any physician, veterinarian, or dentist to furnish to any person any cocaine or its salts, alpha or beta eucaine or their salts or any compound, mixture or solution, or other product whatsoever of which cocaine or any of its salts, or alpha- or beta-eucaine or any of their salts is a constituent or ingredient except in such quantity as may be necessarily employed upon the patient at a time or place of treatment, provided that before administering same they shall make or cause to be made in a book exclusively for that purpose, an entry of the name of patient, date of treatment, the quantity, name of article used and name of person by whom the treatment was administered; said book shall always be open for inspection at reasonable time to any member of the State board of pharmacy, State board of health, food and drug commissioner or any inspector of food and drug commissioner or State board of pharmacy; said book shall be preserved for five years after the last entry was made therein.

Section 5. Any person violating any of the provisions of this act shall be guilty of misdemeanor and upon conviction shall be fined not less than two hundred (\$200) dollars, nor more than three hundred and fifty (\$350) dollars or by imprisonment in the county jail for a period not more than six months or by both such fine and imprisonment in the discretion of the court.

An act entitled, "An Act to prohibit druggists, drug clerks, and proprietors of drug stores from selling cocaine without a prescription from a surgeon or physician," approved March 31st, 1897, and all acts and parts of acts in conflict herewith are hereby repealed.

Approved May 30th, 1911.

Connecticut: Several proposed changes in pharmacy law, but no definite action taken to date.

Illinois: Registration fee raised from \$5 to \$10. Secretary of board's salary raised from \$2500 to \$3000. The per diem of the members of the board raised from \$5 to \$8. Under the present law a registered pharmacist who takes into his employ an apprentice for the purpose of becoming a pharmacist is "required" to "at once" apply to the board of pharmacy for the registration of such apprentice. The new law strikes out the word "required" and inserts the word "instructs." It also eliminates the words "at once." The following important provision in regard to prescriptions is incorporated in the law:

Every proprietor or manager of a drug store or pharmacy shall keep in his place of business a suitable book or file, in which shall be preserved for a period of not less than five years, the original of every prescription compounded or dispensed at such store or pharmacy, numbering, dating, and filing them in the order in which they were compounded, and shall produce the same in court or before any grand jury whenever thereto lawfully required. Said book or file of original prescriptions shall at all times be open for inspection by duly authorized officers of the law.

Indiana: Law passed giving the board of pharmacy power to revoke certificates for cause; also the granting of locality permits; and registration of apprentices. A law was also enacted which prohibits under suitable penalty the sale of drugs and medicines by unregistered dealers within two miles of a drug store.

Iowa: The following laws were passed in Iowa.

A law permitting reciprocity in certificates of registration.

A law specifying duties of secretary and limiting number of examinations to five during the year, and requiring that all be held at Des Moines except one, which may be held at Iowa City.

A law passed permitting sale by any one of certain insecticides and fungicides.

A law passed permitting the sale on prescriptions of cocaine, ergot, and so forth.

The pure drug act was amended by making appropriation for purchasing samples and providing that the chemist of the food department shall do analytical work necessary.

Liquor law was amended under which wholesale druggists may sell to physicians and also allowing permit holders to fill out request blank before signature of purchaser.

Michigan: A bill passed in the dying hours of the legislature said to have been introduced under an euphonious name and passed without reading, as follows: "That all poisons in schedules A and B must hereafter be sold by retailers and wholesalers only, in bottles having corks provided with a 'wood, celluloid, glass, or metal disc, with serrated edge.' Violations are punishable by fine ranging from \$90 to \$300 or imprisonment between three months and a year or both.

Minnesota: A new pharmacy law was introduced but failed of passage. Three bills were introduced covering the pure drug feature, following the lines of the national law, but all failed of passage.

One bill was introduced allowing physicians to run drug stores in villages in which no drug store was located and ten miles from a town in which a drug store was located. This failed of passage.

Missouri: A law passed making the appropriation (\$20,000 for two years) with a rider cutting off the right to employ special counsel in the execution of the law.

Montana: The following narcotic law passed and was approved February 7th, 1911:

Section 1. It shall be unlawful for any person to sell, furnish or dispose of any opium, morphine, alkaloid-cocaine, or alpha- or beta-eucaine, or codeine, or heroin, or any derivative, mixture, or preparation of any of them, except upon the signed prescription of a physician, or veterinarian duly licensed under the laws of this State, which prescription shall be retained by the person dispensing the same, shall be filled but once, and of which no copy shall be taken by any person, except as hereinafter provided. The person dispensing the same at the time thereof shall endorse on the back of such prescription the name and street and house number of the person to whom dispensed; and the proprietor or manager of the store where dispensed shall keep all such prescriptions in a permanent file, separate from all other prescriptions, in his place of business for two years after the same shall have been dispensed, and shall at any time allow the same to be inspected, and copies thereof to be made by any peace officer, the prosecuting attorney of the county where sold, or any authorized inspector of drugs; provided that nothing herein contained shall prohibit any manufacturer or licensed druggist from selling or delivering any of the above named to a person known to be a licensed physician, licensed veterinarian, or licensed druggist, nor prohibit a physician from dispensing the same in good faith to his patients, nor prohibit the sale of patent or proprietary or medicinal preparations containing opium or morphine, in combination or compound with other active elements wherein the dose of opium is less than one-quarter grain, or morphine not more than one-twentieth grain, or codeine not more than one-quarter grain or heroin not more than one-twelfth grain.

Section 2. It shall be unlawful for any physician to sell, or give to or prescribe for any person any opium, morphine, alkaloid-cocaine, or alpha or beta eucaine, or codeine or heroin, or any derivative, mixture or preparation of any of them, except to a patient believed in good faith to require the same for medical use, and in quantities proportioned to the needs of such patients.

Section 3. Any person found guilty of the violation of this act shall be punished for each separate offense (and each and every individual case shall constitute a separate offense), by a fine of not less than fifty (\$50) dollars, nor more than five hundred (\$500) dollars, or by imprisonment in the county jail for a period of not less than sixty days nor more than one hundred days, or by both such fine and imprisonment.

Section 4. All acts and parts of acts in conflict herewith are hereby repealed.

Section 5. This act shall take effect and be in force from and after its passage and approval.

Approved February 7th, 1911. Edwin L. Norris, Governor.

New York: The following bill was proposed:

Wholesale dealers in drugs, medicines, pharmaceutical preparations, chemicals or poisons shall affix or cause to be affixed to every bottle, box, parcel, and outer inclosure of any original package containing any of the articles of Schedule A a suitable label or band in red ink with the word "poison" upon it. It is unlawful for any person, persons, or corporations, other than the manufacturer, and who is a retail dealer, to sell or to furnish any of the poisons of Schedule A and B in liquid form except, in addition to foregoing, in a bottle of peculiar shape or in a bottle having cork or stopper of peculiar shape to apprise any persons handling the same by sense of touch that the contents thereof contain poison or poisonous ingredients.

A bill known as the Turley bill, backed by the "World," was introduced. "A pharmacist shall be criminally liable for the acts of his clerks; that the name, address, license, number and date of compounding shall appear on the label of every finished prescription prescribed; that a book shall be kept containing the name of the physician prescribing, and his address, the date of receipt, the date dispensed, and the name and address of the dispenser. Prescriptions to be kept for five years. The names of all clerks and proprietors to be filed with the State board. Every prescription to bear the printed name and address of the prescribing physician. Every false entry upon label, box, or bottle to be deemed forgery and treated as such."

North Carolina: A law passed giving the board discretionary power to reinstate after the revocation of license.

North Dakota: The following bill passed in North Dakota:

On and after January 1st, 1913, an applicant for registration as a pharmacist must be at least 21 years of age, have had at least one year's course in an approved college of pharmacy and three years' experience in a drug store under the supervision of a registered pharmacist. After January 1st, 1915, an applicant must have had not less than two years' course in an approved college of pharmacy and two years' experience in a drug store under the supervision of a registered pharmacist.

Ohio: Passed a bill which prohibits the distribution of samples of patent medicines.

Section 12,705 of the general code was amended in two particulars: First, requiring that every drug store must be in actual charge of a registered pharmacist, and second, defining a drug store.

Oklahoma: A law was passed granting permission to veterans of the civil war license to peddle medicine without a fee.

Pennsylvania: The following bill was passed by the Penn-

sylvania legislature and approved on the 9th day of June, 1911: This bill seems to have somewhat of a personal element in it.

Section 1. Be it enacted, etc., That any person who was more than twenty-one years old, and entitled to registration as a pharmacist, as provided in section 3 of the act, entitled, "An act to regulate the practice of pharmacy and sale of poisons, and to prevent adulterations in drugs and medicinal preparations, in the State of Pennsylvania," approved May twenty-fourth, Anno Domini one thousand eight hundred and eighty seven, and who failed to apply for registration within the ninety days, as provided within said act, may make such application at any time within thirty days after the passage of this act, with the same force and effect as if such application had been made within the ninety days provided in the act of May twenty-fourth, Anno Domini one thousand eight hundred and eighty seven: Provided, that the applicant had been continuously employed in the drug business since the approval of the aforesaid act, and pays to the State pharmaceutical examining board the application, certificate, and renewal fees which would be due, and owing the said board had the applicant become registered as provided in section three of the act hereinbefore mentioned.

A bill was also passed creating a bureau of professional education as a sub-department of the department of public instruction. This bill was signed by the governor June 19th, 1911. This law provides for a method of determining the preliminary educational qualifications of applicants for license to practice medicine, dentistry, or pharmacy, and standardizes the examinations of applicants.

A fee of one dollar will be charged each applicant for the issue by the bureau of the certificate of proficiency, following successful passing of examinations, and an additional sum of one dollar shall be charged for each examination. The new law provides \$15,000 for the purpose of carrying out the work of the bureau.

Tennessee: The following law was passed in Tennessee:

Section 1. Be it enacted by the general assembly of the State of Tennessee, That all registered assistant pharmacists under existing law shall be entitled to registration as pharmacists under the rules now applying to pharmacists without further qualifications than that of presenting to the Tennessee Board of Pharmacy satisfactory evidence of five years' actual experience as registered assistant pharmacists as now recognized and registered under existing laws; provided, that such five years' experience shall have been continuous and next preceding the application for registration; provided, further, that all assistant pharmacists hereafter completing the term of five consecutive years' actual experience as such, under registered pharmacists, shall be entitled thereafter to registration as pharmacists under this act.

Application for License to Practice by Physicians in Towns under 2,000 Population.

Section 1. Be it enacted, etc., That from and after the passage of this act, it shall be lawful in the State of Tennessee, for any graduate in medicine, who is regularly licensed to practice medicine in this State, and who has been a practicing physician for not less than ten years, to conduct a drug store or pharmacy and to sell therein any drugs, medicines, pharmaceutical preparations and the like, usually sold in drug stores or pharmacies in this State, and to compound and fill physicians' prescriptions, in any and all towns and cities of this State having a population of not more than two thousand inhabitants by the federal census of 1910 or any subsequent federal census.

Section 2. Be it further enacted, That the prescription department, including the filling of all prescriptions and the sale of all poisons and dangerous drugs, shall be under the personal supervision of such physician, conducting the said drug store or pharmacy.

Section 3. Be it further enacted, That any physician proposing to sell drugs or conduct a pharmacy under the provisions of this act, be, and is hereby required to take out a license as a registered pharmacist, which said license shall be issued to him as now provided by law in the case of pharmacists, by the board of examiners, upon proper showing that he is a regularly licensed physician in this State and that he has practiced his profession in this State for a period of ten years next before applying for such license, and said license shall be issued to him without an examination, he to pay the fee prescribed by law therefor.

Utah: A cocaine, morphine, opium, and so forth law was passed and approved March 20th, 1911.

Unlawful to sell. Exceptions. It shall be unlawful for any person, firm, association or corporation to sell or otherwise dispose of cocaine, morphine, heroin or opium or any of the derivatives of opium, except upon the prescription of a reputable licensed practicing physician, and said prescription shall not be refilled, provided, that the above provisions shall not apply to sales at wholesale by jobbers, wholesalers, and manufacturers to retail druggists nor to sales at retail by retail druggists to a regular reputable licensed practicing physician, dentist, or veterinary surgeon, nor to sales made to manufacturers of proprietary or pharmaceutical preparations for use in the manufacture of such preparations, nor to sales to hospitals, colleges, scientific or public institutions; and provided furthermore, that the above provisions shall not apply to such preparations as are recognized by the United States Pharmacopoeia or to standard proprietary remedies. Provided further than no practitioner of medicine, dentistry or

veterinary medicine shall furnish to or prescribe for the use of any habitual user of the same, any cocaine, morphine, heroin, or opium, or any of the derivatives of opium, or any salt or compound of any of the foregoing substances, or any preparations containing any of the foregoing substances or their salts or compounds; and no practitioner of dentistry shall prescribe any of the foregoing substances for any person not under his treatment in the regular practice of his profession, and no practitioner of veterinary medicine shall prescribe any of the foregoing substances for the use of any human being, provided, however, that the provisions of this section shall not be construed to prevent any lawfully authorized practitioner of medicine from administering in good faith, for the use of any habitual user of narcotic drugs, who is under his professional care, such substances as he may deem necessary for his treatment, when such administration is not for the purpose of evading the provisions of this act.

Penalty. Any person, firm, association, or corporation violating any of the provisions of this chapter shall be deemed guilty of a felony, and shall be punished by imprisonment in the State prison for not less than two years and not more than five years, or by a fine of not less than two thousand (\$2000) dollars nor more than ten thousand (\$10,000) dollars, or by both such fine and imprisonment. Approved March 20th, 1911.

The following law in regard to fees was approved March 20th, 1911.

Every person applying for registration as assistant pharmacist shall, before certificate be granted, pay to the secretary of the board the sum of \$5, and every application for registration as registered pharmacist, shall pay the sum of \$15. In case of failure of an applicant upon his or her first application to pass a satisfactory examination before the said board, a second examination shall be granted him or her without further payment of fee, if applied for within six months from the presentation of such first application for examination.

That all fees paid and fines and forfeitures collected under chapters 1 and 2 of title 62, Compiled Laws of Utah, 1907, and the amendments thereto, shall be paid into the treasury of the State board of pharmacy for its use.

Vermont:

Section 1. Section 5396 of the public statutes is hereby amended so as to read as follows: Section 5396. Said board shall meet annually at the State House on the second Tuesday in January and elect a president, secretary, and treasurer. Three members shall constitute a quorum. It shall also meet once in three months to examine applicants for licenses and certificates, and at least thirty days' notice of the time and place of such meetings shall be given by mail to all known practicing pharmacists and applicants in the State. No. 214, Sec. 1—Section 5402 temporary licenses of the public statutes is hereby repealed.

Section 2. This act shall take effect from its passage.

West Virginia: License fee of \$25 in State and \$25 in town or city reduced to \$2 in each case.

Wisconsin: Two bills of interest to pharmacists were under consideration, neither of which, however, were enacted into law.

The first bill sought to re-enact an old statute which was repealed in 1907. This provided that others than registered pharmacists might lawfully sell drugs, medicines, and poisons, providing they were sold in original packages put up and properly labeled by a registered pharmacist, bearing his name and the number of his certificate.

The second bill provided that no liquor could be lawfully sold by a registered pharmacist anywhere in the State except on the prescription of a licensed, practicing physician. Both of these measures were opposed by the retail druggists of the State.

Colleges and Education.

The wise man profits not only by his own mistakes but by the mistakes of others. We have seen a multiplication of the "diploma mills" in medicine following the requirement of a medical diploma for registration, and one of their serious problems, at the present time, is the elimination of unworthy institutions. To prevent a similar unfortunate condition in pharmaceutical education the standardization of the schools should be undertaken at once.

In the standardization of the medical schools they have been fortunate in having the assistance of the Carnegie foundation. According to the definition of a medical school or college as adopted by the Carnegie foundation only about one-half of our medical schools are teaching medicine in an acceptable way. The report of Mr. Flexner for the Carnegie foundation for medical education has already had far-reaching effects, as 47 medical colleges have adopted higher entrance requirements and 7 examining boards have adopted preliminary requirements in advance of a four year high school education.

As a result of the investigation of the Carnegie foundation conclusive proof is given that the only way to get first hand information concerning colleges is to have them inspected by competent persons who can report without fear or favor on the actual conditions found. It may be true in pharmacy, as they found in medicine, that some of the best schools on paper were utterly worthless as far as teaching facilities were concerned. A motion carried last year favoring the inspection of pharmacy schools by the Carnegie foundation and the statement was made that they would undoubtedly undertake the work. If the Carnegie foundation does not undertake this work this association should assume the responsibility of having it done.

The report of the secretary of this section last year showed conclusively the need of standardization of courses of study in our pharmacy schools. From the reports of the pharmacy schools received we find the syllabus has either been adopted or is used as a general guide in practically all, and has, I believe, been of great benefit in systematizing and unifying the teaching among our colleges. The conference of pharmaceutical faculties is making progress slowly, very slowly indeed, as thought by some. It should be remembered that reforms in education as in every thing else are best brought about, and more permanent good accomplished, by keeping in close touch with public sentiment so that rules and regulations adopted will be put into actual practice. Even as slowly as progress has been made by the conference of pharmaceutical faculties some of our colleges, I fear, while apparently living up to the letter of the law, have certainly violated in spirit.

Good results have been brought about by State boards of pharmacy which have power to make rules governing their examinations, and to their credit regulations in several instances have been made raising the standards of education so that virtually their rulings amount to prerequisite laws in other States.

Since the supreme court of the United States has decided that the food and drugs act cannot be held to apply to therapeutic claims the action of President Taft in sending a special message to congress requesting that the food and drugs act be so amended as to include remedial claims within its jurisdiction, so that the government will have legal warrants for its prosecutions, was timely and wise.

From statistics collected from the colleges the total enrollment of pharmacy students seems to be about the same as last year. It is to be noted, however, that there has been an increase of lady students. The University of Washington, at Seattle, leads with 20 for the past year. It is to be noted that the number of students taking pharmacy holding B. S. or A. B. degrees is also largely increased, which is certainly a hopeful sign.

The department of pharmacy of the University of Tennessee, at Knoxville, was abolished in June, 1910, and the pharmacy school of Drake University, at Des Moines, Iowa, has not been in operation the past year. This leaves the number of pharmacy schools at present, counting good, bad, and indifferent, in the United States, at 72. The University of Colorado is to establish a pharmacy school during the coming year at Boulder.

Boston, Mass., August, 1911.

H. L. Taylor moved that Mr. Teeters be requested to continue his statistical work. After it had been pointed out by some members who were more familiar with the working of the section than the mover seemed to be that the collection of such statistics was part of the official work of the secretary of the section, a motion to lay the previous motion on the table prevailed.

Portions of President Eberle's address which had been referred to this section came up for action. The recommendation that a committee be appointed consisting of one member from each State (etc.) to consider narcotics and legislation pertaining thereto, was approved.

The recommendation that the association work for commissions of pharmacy to take the places of the present boards of pharmacy, and to have broader authority, duties and responsibilities, was referred to the committee just

ments were discussed at one time. The paper is reprinted below:

Commercial Training Outline of the Pharmaceutical Syllabus.

By E. FULLERTON COOK.

In the Pharmaceutical Syllabus, first edition, 1910, recognition has been given to the subject of commercial training. Suggestive outlines are offered and about 65 hours of work required in the total of 1000 hours for the

L. E. SAYRE.

E. FULLERTON COOK.

Never misses a meeting and Much interested in the commercial education of druggists. always brings a good paper.

complete pharmaceutical course. This 1000 hours of instruction is divided, in the syllabus plan, into three groups; 300 hours are assigned to the general subject of materia medica, 400 hours to chemistry and 300 hours to the laboratory and theoretical branches of pharmacy.

Of the 300 hours devoted to teaching the special subject of pharmacy, 25 are given over to the theory of pharmacy, 65 to practice, 65 to manufacturing, 50 to dispensing, 20 to Latin, 10 to arithmetic, 10 to bookkeeping, 50 to commercial pharmacy and 5 to jurisprudence. The last three commercial branches, totaling 65 hours, constitute about 22 per cent. of the total 300 hours allotted to this division.

Opinion may differ as to the proportion of time, in a pharmaceutical education, which this subject deserves. The prophecy has been made by a well-known writer on this subject that the time is coming when 50 per cent. of all pharmaceutical training will be commercial.

However, for present conditions, the framers of the syllabus have apportioned as many hours for this work, in comparison with the allotment of the remaining 235 hours for pharmacy, as may be wisely given in a 1000 hour course.

Until a larger number of colleges bring their commercial courses up to the suggested standard of 65 hours, or until the total hours of training are increased, there should be no enlargement of the proportional time now assigned to commercial training.

The present outline of the syllabus is excellent in part. The outlines under "Commercial Pharmacy," first year, page 123, and continued for the second year, page 125, are helpful, although in many instances quite fragmentary and incomplete. There is some confusion about the teaching of bookkeeping. Under "Pharmaceutical Arithmetic," page 106, 15 hours of didactic and 5 hours of laboratory instruction are assigned to a course of arithmetic which alone would demand the full time, if satisfactorily treated, while to it is added "Bookkeeping—Single Entry—Double Entry—and Commercial Forms." The work required here is out of proportion to the hours.

Later, on page 125, under "Commercial Pharmacy," bookkeeping is reoutlined and most elementary training suggested, such as "theory of bookkeeping" and "necessity for proper books of account," while practical bookkeeping work is duplicated.

But the outline most impossible of accomplishment in the allotted 5 hours is that on pages 128, 129, 130, 131, 132, and 133 on "Pharmaceutical Jurisprudence." However meritorious this detailed course, covering six pages in

JOHN B. BOND.

F. C. GODBOLD.

Two loyal old-time members from the far South

provided for when it is appointed, without recommendation.

The message of President Taft to congress in which he strongly advocated a strengthening of the food and drugs act so as to make it apply to false therapeutic claims (see the CIRCULAR for July, page 374) referred to in President Eberle's address was endorsed.

H. L. Taylor presented the report of the national syllabus committee for W. G. Gregory, who could not be present. This was followed by a paper, and the two docu-

bare outline, one must despair of teaching it properly in the time assigned.

The outline here again shows a lack of co-ordination in preparing the course, for subjects are duplicated, which appear on pages 125 or 126, such as insurance, banking, negotiable instruments, partnership and corporations.

These brief criticisms will serve to call attention to some of the needed changes in the present syllabus, in the commercial outlines, but the suggestion of greatest importance here offered is the *method* of teaching. It is believed that subjects should not be taught disconnectedly; for them to properly interest and impress the student, they should be so arranged and grouped that their necessity and importance will be realized. For instance, a completed life history of a business, in miniature, should be experienced by each student; he should be led step by step through the conditions, as nearly as they can be simulated, in which he will need the knowledge, and taught the subject at the time when it can be applied. The facts will then be interesting and will lose their theoretical aspect. The following may illustrate more clearly what is meant:

The course can be started by assuming that the student is about to enter the drug business. This introduces the problems involved in establishing a successful store, i. e., capital, training, location, partnership, buying an established business, starting new store, professionalism vs. commercialism, etc., and these questions may be discussed at once. Being now ready to assume the responsibility of proprietorship, a number of other subjects naturally arise, as, banking, negotiable papers, relations with a landlord and the lease, store arrangement, ordering supplies, buying to advantage, advertising, store management, salesmanship, letter-writing, insurance (fire, life and indemnity), licenses, establishing personal credit, allowing credit to customers, discounting bills, expenses and their relation to profit, etc., etc.

All these subjects are closely linked with the bookkeeping which will be required, and if the items of business are properly selected, the necessary business facts can be introduced as the course proceeds and explained and illustrated at the proper time.

In so far as legal training is concerned a few principles in the field of general law is about all that a student of pharmacy can safely use. It will be wiser to trust a reliable lawyer when a real need arises. However, in the special branch of laws relating to pharmacy and pure drug legislation he should be thoroughly grounded, so that no doubt of duty and obligation can exist.

This paper has not been offered in any unfriendly spirit; the value of the syllabus in bringing about more harmony in pharmaceutical education is appreciated. The suggestions are presented with the hope that they may aid, by constructive criticism, in the development of a more perfect outline in the next edition.

C. B. Lowe said the syllabus was a good thing but new and unbalanced at present. He spoke of the third edition on physiology recommended therein, on the nervous system. No physician, he said, would undertake to lecture on such a complicated subject until he had brought his students up to the point of understanding something about it by more than two lectures.

H. B. Mason called attention to the fact that the syllabus was only tentative yet, and was undergoing drastic revision. In time it would be made as nearly perfect as circumstances would permit. The committee welcomed constructive criticism, such as had been offered by Mr. Cook.

On motion of Mr. Lowe the paper by Mr. Cook was referred to the syllabus committee.

After a short intermission, during which time an adjourned session of the general session was held, the section proceeded with its usual business.

The next paper presented is herewith printed in full:

The Real Educational Needs of the Pharmacist.

By HENRY P. HYNSON.

These conclusions are arrived at from a point of view secured by standing upon a mass of my own needs and deficiencies, that is heightened and made more secure by the deficiencies of many proprietors with whom I have come in contact, and, more particularly, by the glaring defects of clerks I have employed.

It must be clearly understood that I am not presuming

to criticise the syllabus of studies outlined by the able national committee which has had that matter in charge; indeed, I will be glad if I am able to assist that body of earnest workers in the good work they are doing.

It would seem that a person knowing, and knowing well, all the subjects that that committee has prepared for a college curriculum, might be a fairly good pharmacist. Yet I believe there will be many who will, when the course of studies proposed be put into operation, make a uniform rating of over ninety *percentum*, and then fail, sadly fail, to meet the requirements of the retail pharmacist of to-day, even in strictly pharmaceutical pursuits.

I will confess that my standard of success is quite different from that of many others who may be very properly rated as both sane and sound. The mere fact that a pharmacist wears large diamonds in his shiny, celluloid shirt front or rides in an orange, red and green colored automobile, or cleaves placid waters with a sputtering motor boat and pays for them all, while still having "money to burn," does not, in my opinion, prove that he is or has been a successful pharmacist. I am quite ready to grant that money making and money saving constitute one and a very essential element of success. Any one who, barring unusual misfortune, fails to do this can not be styled successful. But, beside providing for himself a comfortable living and a few ducats for a "rainy day," the really successful pharmacist must have made himself truly useful to the community in which he is located, and, by all means, he must have won respect for the vocation in which he has served; glory and honor must have been added to his profession because of his accomplishments and because of his honorable practice. Only such practitioners will be remembered; only such practitioners will leave the world of pharmacy and, incidentally, the world at large better because they lived, thus evidencing the only kind of success that is really worth seeking.

Now to win such satisfactory results, one must, of all things, have an abundance of *common sense*. That means, I believe, that he should possess that quality of mind which will prevent him from making a fool of himself when solving problems, the exact counterpart of which he has not solved before or which have not been solved in his presence. Some call it logic, some call it reason, but it is neither, because satisfactory results may not follow the use of these qualities. It would be better to style it self-reliance or dependence upon natural "wit."

I do not believe it can be accurately concluded that this "common sense" is ever inherent; I am strongly of the belief that it is, after all, acquired through experience. Here the important matter for consideration is to find out how it is that some acquire so much of this most valuable knowledge quite early, even with their first impression. If it is environment or parental excellence, then, for the love of coming generations, let us try to find what and how it is, that very many more may acquire it.

I do not want to be hazy about this; I trust to be understood and as saying that when this quality of mind is found lacking in a student or apprentice, in some way or another, it must be supplied to him and, if he cannot acquire it by some process of education, then he must be forced out of pharmacy's domain by our colleges, or if not by them, by our boards. Judging from the output of a half dozen colleges, I am inclined to think the schools have not been able to eliminate this fool-class of would-be pharmacists. To do this, however, is fundamental and we must not be satisfied; we, who try to be honorable and true, must not be satisfied until we "nip off" these entirely impossible buds from the pharmaceutical bush, early, before they even begin to open. But to do this effectively, we must establish a just and thorough test for "buds." I wonder if it will ever be possible to use such tests in un-endowed schools?

Another peculiar something a pharmacist needs to be taught is to be dignified; he must acquire true dignity. By this I mean he must be intelligent enough, careful enough and honest enough to know himself, and thus knowing himself, he must be so well equipped as to win, first, his own respect and, secondly, the respect of those who really and truly know him.

True pharmaceutical dignity, then, is the behavior that is inspired by reasonable self-respect and by the generous respect of those with whom we come in contact in the practice of our profession. Refinement and dignity are much the same or are, at least, inseparable. Both are the result of self-examination and self-instruction, acquired

and stimulated by comparing one's self with idealistic standards of excellence; when he should be more accurate in his findings and more severe in his requirements than he is in his estimation of others.

We pharmacists need, probably more than anything else, to be cultured; broadly cultured. I understand culture and training to mean much the same. I do not believe either consists entirely in possessing much knowledge of the classics, of higher mathematics or of many modern languages. All these *contribute* to culture, but I question the quality of any one's culture when he is not able to make himself easy in polite society or able to successfully meet the requirements of higher social life. The appropriately cultured person is always conventional, and it is

H. P. HYNSON.

A man who can always be counted upon to rise to the occasion.

G. M. BERINGER.

A diligent worker in formulae for the Pharmacopœia and National Formulary.

a sad spectacle one makes who is conspicuous because of oddities that are his.

Standards for culture may be selected from those persons in a community who enjoy universal respect and from those who are prominent because of real worth and because they really merit the position they occupy. It is quite easy to separate the true from the false in any community, and thus find helpful standards.

Yet, withal, pharmacists, like all men who really bear the image of the Creator, need to be or to become truly romantic; that is, able and willing to do even the unusual if that is necessary for truth's sake. Romance never clashes with the conventional; it is often the quality that enables us to be conventional at the sacrifice of pride, ambition or some such less creditable attribute of our nature. We are romantic when we sacrifice possible gain, gain that others do not hesitate to acquire, because we will not ignore the higher ideals of our vocation, and it is the true and beautifully romantic spirit that enables us to resist temptations, to do the right and boldly stand for the nobler and more useful forms of practice; certainly that form which obeys civil law and follows the leadings of the more delicate precepts of personal righteousness.

The pharmacist needs to be taught and to learn much more regarding true art; he must, indeed, become more artistic. Probably such knowledge is really a part of general culture; certainly, one may be neither polite nor dignified without a fundamental knowledge of art. It is this information that will make him able to appreciate real values, and it is this same knowledge that will lead him to employ durable, appropriate and useful fixtures and appointments in the prosecution of his business. Nothing, it is believed, conduces so largely to the doing of better things, in better ways, than does this knowledge of true art. It inspires its possessor with the desire to present the higher forms, those that more nearly approach the ideal. The real artistic spirit will guard one against committing vulgarities which entirely counteract the helpful influence of the highest technical acquirements.

I have not intended to convey the thought that less technical knowledge is required. I would, however, suggest this, in case it be found necessary to make place for this more general teaching.

I am confident, because of what I have heard so many times, that it will be said these broader teachings are no part of a technical training. Let me advise that I have not attempted to discuss the technical training of the

pharmacist at all, but have tried to show what I believe to be his greatest educational needs, no matter where they are to be supplied, and I am trying to be extremely practical by calling attention to the fact that there is, annually, going to the schools of pharmacy of this country, as has certainly been the case since 1876, a class of young men who need and have needed the very instruction that I have suggested; needed for the better serving of the public, for the greater advancement of pharmacy and for general betterment of themselves. Do not overlook the fact that it is this kind of grist that has been coming and that continues to come to the pharmaceutical college mill. I believe I may truly say it is the very same kind that will continue to come for years and years. Therefore, I believe it to be our duty, a part of our work, to so modify our mills that they will clean this grist and prepare it for the final finer grinding. Let us take it as we find it, as it comes to us and, during a preliminary year, blow out all the chaff, blow it forever away, while cleaning and polishing the sound grain. As it is, we are mixing chaff and erudities and deficiencies and misfortunes all together with results that are, by no means, satisfactory to the three factors most interested; the public, the employer and the employee. Secondary schools may help and colleges may more largely assist, but while these remain such uncertain quantities as they now, most certainly, are, a practical preparatory course in the schools of pharmacy is really the only thing that will supply, out of the material at hand, the quality and quantity of pharmacists required to meet present day demands.

Common sense, dignity, culture, are the possessions; romantic, artistic are the qualities! Is there a successful practical pharmacist within the sound of my voice or anywhere else who will not admit, when he fully understands what these mean, that they are more essential to the really helpful assistant than is all the strictly technical training he may secure at the best of our pharmaceutical schools? These possessions and qualities make up the advantages that it has been thought result from "drug store experience." It is very true that, when this so-called experience gives such things, it is, indeed, most advantageous. But what is the situation when it does *not* give these, but instills everything that is contrary; what then?

Let us see, just for a moment, what these possessions and these qualities mean. Common sense, I believe, means no more than the ability to properly attack a problem. When a clerk *goes at a thing right*, we know how valuable he is; how safe he is and how much he will accomplish. We all know that this ability does not come from technical training, necessarily, although, technical training, if properly directed, will greatly assist in its development.

Dignity and culture make the successful salesman or merchant; they claim respect and inspire confidence. Those, assisted by artistic temperament and attainments, make an invincible combination that will be more effective in the proprietor than it is in the assistant, however powerful it may there appear. Carriage, manner, conversation, dress, store, stock, utensils, labels, advertisements, everything material that is worth while, should come under the beneficent control of these; dignity, culture, art.

It is, however, the romantic spirit, true heroism, that makes up the character and shapes the policies of the business and the business man. Nothing less and nothing different will prove effective. Neither fear of the law or lust for gain will be powerful enough. Romance alone will bring about good results; love it is, after all, love for the real, the true and the good.

And so, my dear friends, with the material at hand, we must try a year of probation; a year of tutoring in common things, that are really higher things; a year in making up deficiencies and in smoothing rough surfaces; a year in refining, which means a year of much elimination, of *helpful* elimination. Am I understood? Three years? Yes, by all means, but be very careful that there is no more of the technical than there is now. One year of fundamental preparation; one year devoted to making and finishing *men*; two years devoted to making and finishing practical, useful pharmacists.

"Are the Present Day Needs of Pharmacy Met by the Present Curriculum?" was the title of a paper by L. E. Sayre, of Lawrence, Kan., which was followed by one along somewhat similar lines by Philip Asher, of New Orleans, in

which the author referred especially to the examinations by boards of pharmacy of candidates for licensure.

This brought the session to a close.

Second Session, Thursday Afternoon August 17th.

Owing to a slight indisposition on the part of Chairman Johnson, Associate J. C. Wallace, of New Castle, Pa., presided at the second session of the section, held Thursday afternoon.

In his report as chairman of the committee on national legislation, referred to this section by the general session, H. P. Hynson recommended the establishment of a permanent legislative conference under the auspices of the section, to be composed of delegates from the American Pharmaceutical Association, the National Association of Retail Druggists, the National Wholesale Druggists' Association and the Proprietary Association of America. His reason for suggesting that the American Pharmaceutical Association take the lead in this matter was that under itsegis all branches of the trade could meet, while the same was not true of any of the other bodies mentioned. He also referred with some degree of detail to various legislative matters of a national character, mentioning pure food and drugs bills, public health measures, narcotics and patents.

Messrs. Freerichs and Anderson thought the idea that a legislative conference be created a good one, but deemed it more fitting that such a conference be left free to organize itself as it saw fit, and not be tied to the American Pharmaceutical Association.

The section agreed that the proposed step was in the right direction and referred the proposition to the council to be put into effect, amended, however, as suggested by Messrs. Freerichs and Anderson.

A paper on national legislation was read by Mr. Freerichs, in which he recapitulated much that had been done by congress of interest to druggists.

L. E. Sayre submitted the report of the committee on drug reform. (An outline of the work of this committee is given in the CIRCULAR for February, page 66.)

H. P. Hynson, chairman of the committee to which had been referred the chairman's address, submitted a report approving the two principal recommendations made in the address, namely, (1) that the association in all its departments endeavor to bring about general uniformity in pharmaceutical legislation, and (2) that broader curricula, with especial reference to the commercial needs of pharmacists be introduced in the colleges of pharmacy. The report was adopted and the first recommendation was referred to the council and the second to the national syllabus committee.

Other papers, read either in full or by title, and duly referred, were contributed by G. H. Meeker, of Philadelphia; C. A. Mayo, of New York; R. A. Lyman, of Lincoln, Neb.; Henry Kraemer, of Philadelphia; M. I. Wilbert, of Washington; J. W. Sturmer, of Lafayette, Ind.; and H. M. Whelpley, of St. Louis, after which the session adjourned.

SECTION ON PHARMACY AND DISPENSING.

First Session, Wednesday Afternoon, August 16th.

After going through the formality of opening the first session of the section on practical pharmacy and dispensing Wednesday afternoon, Chairman Louis Saalbach, of Pittsburgh, called upon Otto Raubenheimer to present a paper on the color of tincture of iron citro-chloride. Mr. Raubenheimer illustrated his remarks with various samples of the tincture, ranging in color from light-green to greenish-brown.

A. B. Stevens, of Ann Arbor, referred to the complicated chemistry of preparations of the compound iron salts. He had begun a paper on the subject several years ago, which he had not yet completed, being only about knee-deep in it.

Remarks were also made by C. M. Ford, of Denver, and H. P. Hynson, of Baltimore, the latter expressing satisfaction at learning that so well-qualified a man as Mr. Stevens was earnestly at work on the subject.

INFUSION OF DIGITALIS.

Infusion of digitalis came in for a good share of discussion, both its mode of preparation and its physiological properties being touched upon. Charles M. Ford, of Denver, led off with a paper on the subject. J. L. Lascoff, of New York, followed with another, in which he told of

prices paid for digitalis and of the activity which the various samples showed when tested physiologically. The higher-priced samples showed greater strength in almost exact ratio to the price.

C. E. Vanderkleed, of Philadelphia, corroborated Mr. Lascoff's report, saying that he had made the assays. Otto Raubenheimer raised a laugh by expressing astonishment at Mr. Vanderkleed's willingness so soon again to make physiological assays for a New Yorker. (See the CIRCULAR for April, page 226.)

E. V. Howell, of Chapel Hill, N. C., told of experiments which showed that stronger heart action resulted from the administration of the infusion.

P. H. UTECH.

LOUIS SAALBACH.

New Chairman of the Section Retiring Chairman of the on Practical Pharmacy and Section on Practical Pharmacy and Dispensing.

M. I. Wilbert, of Washington, said that Mr. Lascoff's conclusion, in so far as it made price a guide to physiological activity of digitalis, was misleading; the matter was far too complicated to be settled in such a simple manner.

Joseph P. Remington, of Philadelphia, in reply to a question, said that digitalis should be kept in tin cases, not covered so tightly as to prevent evaporation of the natural moisture of the leaves. He thought physicians should prescribe infusions more and alcoholic preparations less. High prices were not a guaranty of high quality. Darker (and so-called lower-grade) rhubarb sometimes was more valuable than the fancy specimens, and other instances were not lacking.

The question as to why alcohol was introduced into infusion of digitalis evoked several answers, some of them contradictory; some said that it was used as a flavor, others as a preservative. Mr. Ford said he did not put it in at all.

Mr. Hynson stated that he always made his infusion fresh when ordered, and had built up a large trade in it, physicians from all over Baltimore sending to him when they wanted an article A1. He thought that druggists should be warned, through the pharmaceutical press, to dispense only the fresh infusion, made according to pharmacopeial directions, and after some objections, on the score that such a warning would be an insult to honest and competent pharmacists, Mr. Hynson's idea, put into the form of a motion, was adopted.

A RED COLOR FOR PHARMACEUTICALS.

Charles H. LaWall, of Philadelphia, told of a new color for pharmaceutical preparations, and exhibited samples. He said that he had been requested to produce a color similar to one used in a proprietary antiseptic solution. In his experiments he had found that orchil or archil, a dye made from cudbear by sulphuration, gave the desired shade and did not bleach out. This was to be purchased of the confectionery manufacturers' supply houses, under the name "vegetable red." It could be made synthetically from coal tar, and in some States was looked upon as a coal-tar dye and was treated accordingly under their laws.

S. K. Sass, of Chicago, referred to some of his experiences with colors for antiseptic solutions.

BELLADONNA CULTURE.

"Belladonna Culture in the United States" was the title of a paper presented by L. E. Sayre, of Lawrence, Kan. In speaking of the rapid disappearance from our fields and forests of many of our native drugs, he said that the ex-

port from Kansas of echinacea was 100 tons annually, most of it gathered in a single county, and this in spite of the fact that some investigators had pronounced the drug practically inert. He referred to the experimental farm of Albert Schneider, in California, reporting that five acres planted in belladonna yielded $2\frac{1}{2}$ tons of the herb, which assayed up to the official standard for belladonna leaves. Mr. Sayre wanted American grown belladonna admitted into the Pharmacopœia.

A paper on "Chocolate Cachets," by F. M. Apple, of Philadelphia, was read by P. H. Utech, of Meadville, after which the nomination of officers brought the session to a close.

Second Session, Thursday Forenoon, August 17th.

When Chairman Saalbach called the second session to order Thursday forenoon, Secretary Utech read the minutes of the preceding session, which were approved.

DISTILLED WATER.

"Notes on Distilled Water," was the title of a paper by W. H. Allen, of Detroit, read by the secretary.

E. Fullerton Cook described the still used at the Philadelphia College of Pharmacy.

Otto Raubenheimer related some experiences he had had with so-called distilled water which was far from meeting the requirements of the Pharmacopœia.

The chairman thought every pharmacist should prepare his own distilled water.

The best window display that Mr. Lascoff had ever made consisted of a water still in operation.

At Nashville, said W. R. White, much water from the ice factory was used in pharmacy as distilled water, but it contained iron. Messrs. Ford and Raubenheimer agreed that the water sold for distilled water by the ice factories was not true to label.

HOME-MADE STILL.

The next paper was by James H. Beal, and was entitled "An Inexpensive Pharmaceutical Still." This still, he said, consists of two tin or agate-ware pans of suitable size and shape, a porcelain dish, and a tin pie plate. The smaller of the two pans, which is to be inverted over the larger, so as to form a closed receptacle, is to have two perforations in its bottom (which becomes the top of the still), one for a vent or to be used for adding liquid to that originally in the porcelain dish, and the other to be fitted with a pipe, leading to the condenser. The pie plate, which should be perforated, is placed in the lower pan, the porcelain dish, containing the marc from which the alcohol is to be recovered, for instance, is placed on the pan, glycerin or some similar substance is poured in the lower pan in quantity sufficient to form a steamtight joint with the upper pan when it is introduced, but not sufficient to float the porcelain dish, or to come into contact with its contents, the upper dish, inverted, is then pressed into the lower one until it fits tight below the glycerin level, and the still is ready for the application of heat as soon as the condenser is attached. The upper pan may be held in place by weights or wires.

Beal's Home-Made Still.

When Mr. Beal had finished describing his home-made still, Mr. Raubenheimer observed that even a professor could be practical at times.

John Uri Lloyd, of Cincinnati, was carried back to his boyhood days by Mr. Beal's talk. He well remembered the time when, as a lad, he had had the desire to experiment in physics but had not the necessary apparatus. He

recalled his first attempt to produce oxygen. He had his old Fownes' chemistry with its directions to use potassium chlorate and black magnesium oxide. He used a large milk bottle as a retort, and his mother's old-fashioned camphor bottle for a receiver, but for a time was at a loss to know how to convey the gas from one to the other. After vain experiments with elder, which split when mixed with some dry absorbent powder, as kiesel in the garden, and used these successfully.

It was brought out in the discussion that the Lloyd still, in use in some of the largest pharmaceutical manufacturing laboratories, had been developed from the rudimentary apparatus just described.

MORE ABOUT RED COLORING MATTER.

Alexander Gardiner, of Brooklyn, read a paper on "The Coloring Principle of Cudbear" on which he and Otto Raubenheimer had collaborated, and submitted a number of specimens. He extracted this principle by percolation with acetone, the yield being about $8\frac{1}{2}$ per cent., and had named it pershionin. It was a semi-liquid which he had been unable to dry and powder successfully, although when mixed with some dry absorbent powder, as kieselghur, it would remain in a pulverulent condition. Cudbear, he said, contains about 4 per cent. of sodium chloride, which interacts with some of the substances present in certain mixtures with which it is used, with the result that the color is destroyed.

He gave this formula for a red show-globe color:

Pershionin	10 grains.
Wood alcohol.....	8 ounces.
Ammonia water.....	6 drams.
Water.....	enough to make 1 gallon.

Mr. Lloyd advocated the more extensive use of innocent vegetable colors in pharmacy, in preference to those of a questionable character. He spoke of curcuma, chlorophyll, and others, and said that we needed color standards that would remain one color always.

The next paper read by its author, is here presented in full:

A New Method of Making Tincture of Opium.

BY WILLIAM R. WHITE.

Tincture of opium, which is undoubtedly the most important preparation in the Pharmacopœia, has been the subject of much study and investigation. Many methods have been devised for its manufacture, the majority of which have involved both the principle of maceration and percolation. The chief feature of this method, however, is that it is based entirely on the principle of maceration. There are three points in which the writer claims it has an advantage over the U. S. P. method, namely, (1) it entirely exhausts the opium, (2) it avoids the slow process of percolation, and (3) it recovers a part of the menstruum left in the marc.

The process is as follows: Take 100 grammes of the U. S. P. granulated opium and add to it 500 c.c. (mils) of boiling water. Macerate for forty-eight hours with occasional stirring, add 500 c.c. (mils) of alcohol; macerate again for forty-eight hours with occasional agitation, then allow the drug to precipitate, decant the clear supernatant liquid, place the residue on a filter and allow the menstruum to filter until it ceases to drop; then place the filter and contents in a tincture press and express as much as possible, add the filtrate to that portion decanted, measure the whole, noting the difference between that obtained and the 1000 c.c. (mils) of menstruum used. The mass is then exhausted with hot water by adding about 80 c.c. (mils) at a time, allowing it to macerate a few hours, then expressing it. This operation is repeated until the opium is exhausted, which can be ascertained by testing the filtrate with the general alkaloidal reagents. The combined extractions are then evaporated on a water bath until the volume is equal to one-half the difference noted above. This is then mixed with an equal volume of alcohol and added to the measured filtrates. The whole tincture is then filtered, and is ready for use.

If a press is not available, the same results can be obtained in the exhaustion of the drug with the hot water by repeatedly macerating and filtering instead of expressing, except that all the alcohol left in the marc will be lost by the subsequent evaporation. About 400 c.c. (mils) of hot water has usually been found sufficient to complete the exhaustion. Some samples of opium, however, seem harder than others to exhaust.

The principal objection to this method is the time that is required in evaporation. This is to a large extent under the control of the operator and can be hastened when desired by using a greater number of evaporating dishes or by evaporating in vacuo.

There seems to be no longer any dispute over the question whether water will exhaust opium of its morphine, since the United States Pharmacopœia has relied upon this fact in its directions for making the deodorized tincture of opium; also in the extraction of the opium in the assay process.

In 1902, Dr. E. A. Ruddiman published an article in the Bulletin of Pharmacy, volume xvi., page 368, in which he claimed that the opium was not entirely exhausted by the diluted alcohol used in the United States Pharmacopœia 1890 process. In 1906, H. A. B. Dunning, in a paper read before the American Pharmaceutical Association, stated that it had been proved by assay that neither the old nor the new U. S. P. method for making tincture of opium exhausts the tincture made by the above method, the writer can state that his results have proved conclusively that this method does completely exhaust the opium of its morphine.

The saving in alcohol by using this method is quite an item in the cost of the tincture, especially where large quantities are made at a time.

In conclusion, the writer will state that this method has been in constant use by one firm for fifteen years with the most favorable results, and it is his firm belief that the practicability of this method will appeal especially to those pharmacists who are not prepared to assay their finished tincture.

Mr. Raubenheimer called attention to the fact that the alcoholic content of tincture of opium had been reduced in the German Pharmacopœia to 33 per cent., and he thought it should be decreased in the United States Pharmacopœia. He had made good tincture of opium by using only 25 per cent. alcohol.

W. H. Glover, of Lawrence, Mass., made "A Plea for More Working Formulas for Chemicals in the United States Pharmacopœia." Chemicals which are unstable in their nature and are called for but seldom could often be made by the dispenser himself if he had official directions for so doing. He mentioned zinc iodide as an example of the kind of chemicals he had in mind.

Mr. Lascoff believed that many deliquescent chemicals might with advantage be kept by pharmacists in the form of solutions of definite strength, especially as they were seldom prescribed except for administration in liquid preparations.

Mr. Sass wanted more chemical formulas in the Pharmacopœia. When a substance was called for by a formula in the National Formulary, there should be an official standard for that substance. The objection that there was danger of making the Pharmacopœia too large did not seem valid to him, as he did not carry his Pharmacopœia around in his vest pocket, but kept it in his store, where there would always be room for it no matter how large it might grow to be.

Mr. Wilbert suspected that the formulas for chemicals in the back part of the Pharmacopœia had been overlooked by some of the users of that book.

Mr. Utech read "Notes on Some Pharmaceutical Preparations."

In the discussion which followed, Mr. Lloyd spoke of the old-time "Churchill's consumption cure" which he had compounded when a lad in W. J. M. Godon's store at Cincinnati in 1864. He gave the formula, which is practically the same as that now to be found in the Pharmacopœia under "Syrup of Hypophosphites." Churchill's, he said, was the original syrup of hypophosphites.

Edward Kremers, of Madison, Wis., told his experience with a dermatological prescription for precipitated sulphur, giving specimens of the product as made by various methods. Incidentally he said that it was the first time he had appeared before the section.

Messrs. Lloyd, Lemberger, and Good then vied with each other in telling of old-time methods of making up sulphur preparations. Mr. Lemberger said there was a big demand for itch remedies during and immediately after the civil war. Mr. Good had made barrels of Vlemink's lotion according to a formula in the old United States Dispensary before there was ever such a thing as a National Formulary.

J. L. Lascoff read a paper on "Sanitation in Pharmacy"

in which he gave expression to many views—some of them extreme—as to how a pharmacist should employ sterilization and aseptic methods. He spoke of the danger of carrying disease germs from a sick room and disseminating them elsewhere, by dispensing solution of magnesium citrate in second-hand bottles. He said bottles of this kind should be sterilized with formaldehyde before their second use. This, he said, could be done at a cost of ½ cent for thirty bottles.

Mr. Sass did not take back "magnesia" bottles, and found that while some of his customers did not like this at first, in the long run it had proved to be a good advertisement for his store. He did, however, refill a customer's own bottle for him. Mr. Sass also spoke at some length on his process for making cataplasm of kaolin.

As the hour for adjournment had arrived the following papers were read by title only and referred to the publication committee:

"A Few Questions Suggested by Comparisons of National Pharmacopœias," by Oscar Oldberg, of Chicago.

"N. F. and U. S. P. Work: What Have You Done with It?" by W. A. Hall, of Detroit.

"A Few Laboratory Notes," by Thomas A. Egan, of Haverford, Pa.

"Pharmacy Notes," by Louis Schulze, of Baltimore.

SCIENTIFIC SECTION.

Meetings of the scientific section were held almost continuously throughout the week, regardless of the sittings of the other sections, so great was the amount of material brought before it for consideration, and so loyal to science were those members who constituted the chief attendants at the meetings. Chairman A. H. Clark, of Chicago, presided and presented an extensive program of papers and discussions. He was assisted by Secretary W. O. Reichtman, of Satsuma Heights, and Associate C. H. LaWall, of Philadelphia.

In his address Chairman Clark spoke of the record of the section as leader in scientific thought in pharmacy, and said he believed even better work would be accomplished by the section if its organization were materially changed.

E. L. Patch, of Boston, chairman of the committee on drug market, submitted a report, the greater portion of which is here given:

REPORT OF COMMITTEE ON DRUG MARKET.

There continues to be marked improvement in the character of drugs and chemicals. Some reports would not indicate this, because the authorities naturally endeavor to secure samples that they believe to differ from the standard and in many cases publish as adulterations deficiencies in strength and differences in the products purchased from the artificial standard they may create.

To illustrate: Out of 931 samples purchased by one board, about 24 per cent. were pronounced as adulterated or varying from legal standards. This number included liniment of camphor 7 samples, containing from 20 per cent. to 66 per cent. of the pharmacopœial amount of camphor. Seven samples of spirit of peppermint containing from 15 per cent. to 80 per cent. of the required amount of oil. Two of tincture of iodine containing 50 per cent. and 71 per cent. of the standard quantity of iodine. Five of spirit of lemon, 2 of which did not contain oil of lemon and 3 much below standard. Nine of spirit of anise containing from a trace to 75 per cent. of oil. Of these, five samples examined by an outside chemist failed to give concordant results.

The comparison is as follows:—

	Board of health.	Outside chemist.
Spirit of Anise, 1	56 per cent.	59.5 per cent.
2	63 per cent.	89.6 per cent.
3	58 per cent.	63.5 per cent.
4	48 per cent.	71.4 per cent.
5	42 per cent.	63.5 per cent.

Note 1. It has been suggested by one member of the committee that the chemists doing this work were prejudiced, one in favor of low results, the other in favor of high results. The high results were reported by a chemist connected with one of our leading schools, with no interest in the cases whatsoever. The results were by refractometer readings. The No. 4 lot reading 71.4 per cent. was made 73.8 per cent. by the separation method. If any explanation is to be sought it might be found in the unintentional mixing of samples.

Several cases were based on variation of tincture of arnica in extractive, although there is no official standard for extractive in arnica flowers. Such a course seems to be questionable for it is well known that drugs bearing the same name have a divergence in amount of extractive, yielded by different samples, obtained from different sources, grown under different conditions. While we do not believe the range is as wide one in the case of arnica flowers, it is sometimes 100 per cent. in other drugs. Then undoubtedly there is as great a variation in the character of the extractive obtained from different lots of the same drug. Observers of experience are aware of the great variation in the alkaloidal drugs grown in different seasons under varying climatic conditions and have noted that the alkaloidal contents bear no relation to percentage of extractive in the alkaloidal drug.

In the case of tincture of arnica the standard was an arti-

ficial one. It was obtained, we understand, by the board chemist percolating a sample of flowers purchased in the open market and using the extractive per cent. of this product as a standard. He should have obtained many lots of flowers from different sources and made many lots of tincture under different temperature conditions and then adopted the range of results for a standard of comparison, instead of using a single percolate or the average of any number of percolates. The range in extractive in tinctures prepared from drugs bearing the same name is very wide and might hint at improper percolation, but we would have to examine the drug

CHARLES H. LAWALL.

A. H. CLARK.

The new Secretary of the Scientific Section. Retiring Chairman of the Scientific Section.

used to assure ourselves of this. J. W. Pollard, of the Massachusetts College of Pharmacy, found the range in extractive in ten samples of tincture of belladonna, obtained from ten retail drug stores, to be from 1.05 per cent. to 3.76 per cent. and the alcohol content to range from 37.5 per cent. to 47.5 per cent. Ten samples of tincture hyoscyamus gave extractive 1.04 per cent. to 4.27 per cent. and alcohol 23.9 per cent. to 40.3 per cent.

Ten samples of tincture of digitalis gave extractive 1.08 per cent. to 3.45 per cent., alcohol 21.6 per cent. to 40 per cent. Ten samples of compound tincture of gentian gave extractive 1.08 per cent. to 5.01 per cent., alcohol 42.6 per cent. to 56.4 per cent. Of the forty druggists, measured by the highest standards, thirty-six would be condemned as selling an adulterated product. In the case of tincture of belladonna and tincture of hyoscyamus we have an official alkaloid standard, and the extractive standard would not stand in law. Assuming that these tinctures were standard in alkaloid, the extractive variation is remarkably extreme.

Too much care cannot be exercised in arriving at conclusions. A sample of elixir of glycerophosphates was found to contain phosphate. The product was cloudy. It cleared with a small amount of hydrochloric acid and again clouded on adding ammonia. Another package from the same lot was bright and clear and gave no indication of phosphate. A portion in a test tube exposed a brief time to the vapor of a water bath became opaque. A few drops of acid cleared it and ammonia reprecipitated it. Investigation showed that the original package complained of had been exposed to a high temperature. If a publication is to be used as a standard by which men are to be condemned as delinquents, that standard should be as nearly above reproach as possible and not glaringly faulty. The National Formulary offers a formula for solution of albuminate of iron and a propaganda has urged physicians to prescribe it in preference to proprietary products.

One pharmacist finds his National Formulary formula calling for 40 grammes of fresh egg albumin and 200 c.c. of solution of oxychloride of iron for 1000 c.c. and claiming that the product contains 0.026 of iron in 4 c.c.

Another having a revised edition with a formula calling for 40 grammes of dry egg albumin, about 12 times as much as called for by the first formula, and 130 c.c. solution of oxychloride of iron, only 13-20 of the amount in the first formula, is told that it too contains in 4 c.c. 0.026 of iron. The health board chemist who accepts this statement without verification, condemns every lot made by the formula.

Assuming the calculated standard for National Formulary solution of oxychloride of iron the first formula would give 0.029 iron in 4 c.c. and the last 0.0183 iron to 4 c.c. Incidentally, the criticisms of different physicians, who prescribed this preparation, are interesting, and examination of products complained of is instructive. Many samples gelatinized on standing a short time. The alcohol content varied 100 per cent. ranging from 5 per cent. to 10 per cent. Iron varied from 0.015 to 0.040. One used caustic potassa instead of caustic soda. Correspondence with some leading pharmacists brings the acknowledgment that they do not make the product by the National Formulary strictly, but use modifications of their own which they find necessary, yet they do not hesitate to put the product out on propaganda prescriptions.

It is gratifying to note that in cases brought to court under the various food and drugs laws, the courts are taking the view that in cases involving matters of opinion competent testimony must prove beyond doubt the accuracy of the prosecution's opinion. Many of our officials entrusted with large powers under the laws are apt to consider that their individual opinion is the law instead of the mere dictum of an individual. These laws are criminal statutes and great care is necessary so as to prevent injustice being done. The de-

fendant is just as much entitled to an opinion as the prosecution and executive officers must understand that their opinion is not necessarily final.

Dr. Rusby's suggestion that facilities be furnished at importing points for the sorting or garbling of crude drugs, etc., is an excellent one and the association should urge the treasury department to furnish such facilities at an early date so as to avoid loss to importers by rejection of drugs on technical grounds.

We have reached a time when we can establish with fair accuracy the fact that numerous drugs are therapeutically inert. While this is not properly within the sphere of the pharmacists, the neglect of the subject of materia medica in our medical schools has forced the study upon the pharmacist. Would it not be well for the association to prepare a list of drugs which are still used by physicians but which we know to be of no value? The subject is almost of importance enough to warrant the appointment of a committee on inert drugs.

Note 2. One member of the committee objects to the suggestion on the plea that the pharmacist's opinion is of little value. The American Medical Association says that echinacea is inert, but many physicians find it of value. How can the pharmacist decide except upon the testimony of physicians of his acquaintance, while their opinion may be offset by that of other men quite as able?

We again urge chemical and wholesale drug houses to drop as far as possible, the use of the misleading term "C. P. chemicals," adopting in lieu thereof the terms "U. S. P." or "Medically Pure."

Co-operative work on the assay of crude drugs and galenic preparations shows that considerable variation is to be expected in the results of different analysts. In view of the fact that the United States Pharmacopoeia is a legal standard we would impress upon the committee of revision the importance of not adopting assay processes in the new Pharmacopoeia, unless they have been thoroughly tried out and proved to give uniform results in the hands of different workers. It is well to pay attention to the physical characters of crude drugs and place intelligent limits on the quality and variety to be used, rather than to depend alone upon a certain standard based on a more or less inaccurate assay process.

Note 3. Some of the committee were fearful that this suggestion might be misunderstood. Anyone who has given the matter careful and unprejudiced attention, must conclude that in its present condition it is unsuited to such an important place as has been given to it. For a single example, take liquor ferri peptorati cum mangano. It calls for ferric peptonate 45 grammes. Iron peptonates in the market have ranged to assay from 5 per cent. to 50 per cent. of iron and to vary exceedingly in solubility. Manganese citrate is also variable. Where is the standard?

Attention is called to the practice of certain manufacturers of offering chemicals, the percentage of purity of which is given "by difference." The chief impurities are determined quantitatively and the chemical itself "by difference." The results are often highly misleading.

Undoubtedly we shall see great improvement in the next Pharmacopoeia. The valuable Digest of Comments issued by the hygienic laboratory under the editorship of Dr. Motter and Mr. Wilbert and the wide range of experience in the drug laboratory with present processes, should place in the hands of the committee of revision more practical data than has hitherto been available.

The suggestion that has been made to issue yearly bulletins of corrections and improvements would seem to be a good one.

Acacia. The powdered gum will almost always reduce an alkaline copper tartrate solution. It should not be rejected on this ground alone. E. H. Gane.

Acetic Acid. Product labeled pure, contained trace of copper and had bad pyroligneous odor. E. L. Patch.

Acid Benzoic. The test for chlorine compounds is not reliable for distinguishing between the natural and artificial. Some samples of artificial acid show up better by this test than the natural. This means that artificial acid is often offered as natural from benzoin. W. L. Scoville.

Acid Boric. Two barrels contained excess of sulphate of calcium. E. L. Patch.

Acid Lactic. The acid offered for technical purposes which is often very impure, sometimes gets into the drug market. The strength is right, but the acid is dark colored and contains much foreign matter. W. L. Scoville.

Acid Oleic, Purified. One shipment contained iron and was very dark colored. E. L. Patch.

Acid Phosphoric. Fifteen samples tested 84.4 per cent. to 85 per cent. W. L. Scoville.

Acid Salicylic. The use of natural acid from oil of birch is increasing. Its color is the distinguishing feature and is intentionally left dark. W. L. Scoville.

Acid Tannic. Crude acid containing traces of gums and resins is frequently offered. It is compact, heavy and usually dark in color. W. L. Scoville.

Acid Tartaric. Several lots testing well chemically were too dirty to use. Their color was bad and they made a very dirty solution. E. L. Patch.

Aconite Root. One lot of spongy root rejected. Assayed only 0.25 aconitine. E. H. Gane.

Alcohol (Ethyl) in Barrels. New process alcohol made from sawdust by fermentation has appeared in the market. One sample tested 96.1 by specific gravity and had a good odor, but contained 6 per cent. of methyl alcohol. The latter is formed in the process. W. L. Scoville. "Commercial" alcohol is being generally supplied and used by the trade for medicinal preparations. Some of it is of very bad odor and poor quality and trouble may result from use of this article unless the trade is more careful. E. H. Gane. Sample of sugar alcohol stood all U. S. P. tests, was practically odorless and was 94.41 per cent. weight strength. E. L. Patch.

Aloes. Moka. It is an amazing fact that American dealers and manufacturers have for years past permitted themselves to be supplied with this substance under the name of socotrine aloes. H. H. Rusby.

Ammonium Carbonate. Usually runs low. Several lots were

below 90 per cent. pure—84.8 per cent. to 88.24 per cent. W. L. Scoville. Tested 32 per cent., 94.5 per cent., 94 per cent., 96 per cent. E. L. Patch.

Apioi. Adulterated with castor oil, glycerol, gurjun balsam, and a residue from the solvent used in extracting the apioi. Apiois may be green, yellow or white. Are completely soluble in 90 per cent. alcohol, ether, chloroform, acetone, benzene, and glacial acetic acid. Should preserve their fluidity when cooled to 5 degrees. Pharmaceutical Era.

Apomorphine Hydrochloride. The United States Pharmacopœia calls for the pure, crystalline salt. It is the custom of some manufacturers to always send the amorphous variety unless the crystalline is specified. Many druggists do not consult their Pharmacopœia and dispense the amorphous as it only costs 1/5 the price of the crystalline. [Some points of difference were given.]

Asafetida. Thirty-eight lots varied from 2.16 per cent. to 61.2 per cent. soluble in alcohol. One lot gave over 50 per cent. of ash and several lots above 40 per cent. W. L. Scoville. The high percentage of impurity in the commercial article renders necessary a process of purification. One lot of poor grade testing only 40 per cent. soluble in alcohol with over 30 per cent. of ash, was purified and the finished product showed ash 3.17 per cent., alcohol soluble matter 73.71 per cent. E. H. Gane. The difficulties of the year in relation to asafetida have been much greater than those connected with any other article. [Some of those were given.] H. H. Rusby.

Aspirin. Ten samples melted at 130 degrees to 136 degrees C. W. L. Scoville.

Balsam Peru. The impropriety here is in the marketing of a purely fictitious manufactured product, an imitation of the natural one. [This feature was enlarged upon at length.] H. H. Rusby.

Benzoin. Benzoin runs fairly even 70.8 per cent. to 87.5 per cent. soluble in alcohol. E. H. Gane. One sample contained 11.1 per cent. ash and only 72 per cent. alcohol soluble. The impurities were sand and twigs from the tree. W. L. Scoville.

Belladonna Leaf. One bale rejected owing to age and mildew assayed 0.23 per cent. alkaloids. E. H. Gane. Thirteen bales contained an excess of stems. Leaf portion assayed 0.298 per cent. and the stem portion 0.175 per cent. C. E. Vanderkleid.

Bismuth Salicylate. Nearly always contains some subnitrate. Rep. de Pharm.

Buchu. The demand for buchu, U. S. P., has exceeded the supply and the price has been excessively high. This has stimulated the offering of long buchu, which is not recognized by the Pharmacopœia. The admission of long buchu to the Pharmacopœia, and its strict regulation are loudly called for by the conditions described. H. H. Rusby.

Calcium Carbonate. Most lots showed traces of iron and aluminum. One lot was off color, very dirty, showed presence of iron, aluminum, phosphates and dirt. E. L. Patch.

Camphorated Oil. Seven samples assayed from 4 per cent. to 15 per cent. camphor. M. S. E.

Spirit of Camphor. From 7 per cent. to 8.2 per cent. camphor. M. S. E.

Cannabis Indica. This drug continues of great interest. Supplies have continued scarce, and prices high, during the entire year. This has stimulated the importation of large amounts of the drug which cannot be regarded as the U. S. P. article. H. H. Rusby. Ether soluble resin, 12.1 per cent., 11.1 per cent. E. L. Patch.

Cantharides, Russian. 0.4 per cent., 0.4 per cent., 0.4 per cent., 0.48 per cent., 0.44 per cent., 0.5 per cent. E. L. Patch.

Carbon Papers. Nine blue papers showed arsenic varying from 1/250 grain to 2.15 grains per square yard. Two samples were arsenic free. One purple paper had 14 grains to the square yard. One had 1 grain and 6 were arsenic free. Five black papers showed 1/200 grain to the square yard and 2 none. One red paper gave 1/15 grain to square yard. One none. Ernest O. Cook.

Caramel. Adulterated with ammonium carbonate and sodium carbonate. Sometimes contains 50 per cent. sodium carbonate crystals. P. Carles.

Cherry Laurel Water. Assays from 0.03 per cent. to 0.1 per cent. of hydrocyanic acid. E. L. Patch.

Cochineal. The "silver" variety is gradually disappearing and better grades are more easily obtainable. The "silver" variety had a high ash, the characteristic appearance being due to loading. Two samples of powdered purchased in the open market yielded only 3.24 per cent. and 4.90 per cent. of ash where formerly 20 per cent. to 30 per cent. was common. E. H. Gane.

Colchicum Seed. One sample contained but 0.36 per cent. colchicine. E. H. Gane. One lot assayed 0.52 per cent. E. L. Patch.

Collodion. Two lots contained only 75 per cent. of the official amount of soluble gun cotton. E. L. Patch.

Colocynth. Three lots contained ground seeds. H. H. Rusby. Most of the product sold contains seed as well as pulp and prosecutions have been brought on this account. E. H. Gane.

Coto. This drug continues unobtainable, according to the statement of importers. None has been received in the port of New York for several years. Para coto has been almost unobtainable and almost everything that has been offered under this name has been spurious, eight different barks having appeared under this name during the year. H. H. Rusby.

Cream of Tartar. Two samples offered as strictly U. S. P. tested 96.48 per cent. and 98.72 per cent. only. E. H. Gane.

Cresol. One lot rejected as it contained a large percentage of phenol. E. H. Gane.

Cubeb. The official standards for this article should be carefully revised, after a thorough investigation of the relative values of the different forms of the drug. H. H. Rusby.

Digitalis. Increasing doubt is being cast upon the claim that a second year leaf is in any way superior to that of the first year. H. H. Rusby. It has been well determined that leaves of first year growth are equal to or better than those of second year growth, and that a well cured drug does not deteriorate. (See Cæsar and Lortez, in Chemist and Druggist.) Assays of digitalis powder over eighteen months showed no appreciable change. E. L. Patch.

Echinacea. Three lots were found to consist of the roots of some species of brauneria other than brauneria pallida which is the source of true echinacea. Another lot consisted of the roots of rudbeckia fulgida. Oil, Paint and Drug Reporter.

Elixir Calisaya. N. F. Twenty-five samples from retail stores: Alkaloids, 0.042 to 0.313 per 100 c.c. Color from colorless to nearly black. In several a heavy precipitate. Roy A. Peckham.

Ergot. There has been considerable trouble during the year from the offerings of ergot of poor quality. H. H. Rusby.

Ether, U. S. P., 1890. Ether that has stood for some time may contain hydrogen dioxide, supposed to be developed by action of ozone, formed by evaporation of ether, upon the water present. Drug Topics.

Formaldehyde. Often runs a little low owing perhaps to partial polymerisation. Several lots tested 37.2 per cent. to 38 per cent. W. L. Scoville.

Frangula. A spurious bark, apparently a species of rhamnus, has been found mixed in considerable quantity with frangula, and should be carefully watched for by dealers. The bark, in quills of the same size, is much thicker than that of frangula. It is rougher on the surface, of a more dull gray, has a shorter fracture but the resemblance to frangula in some of its forms is rather close. H. H. Rusby.

Ginger Root. Jamaica ginger gave following percentages of alcoholic extract: 6 per cent., 4.6 per cent., 3.3 per cent., 3.5 per cent., 3.3 per cent., 3.8 per cent., 3.8 per cent., 5.9 per cent., 4.6 per cent. E. L. Patch.

Glycerin. Manufacturers pay more attention to getting a colorless glycerin than to purity. In consequence most of the glycerins will develop a bad odor in acid mixture from the fatty acids and aldehydes contained in them. W. L. Scoville. Five c.c. of glycerin with 5 c.c. of water and 1 c.c. of diluted sulphuric acid, shaken and set aside for fifteen minutes should not develop a disagreeable odor. A. B. Lyons.

Goldenseal. The small amounts obtainable test high in alkaloid. Seven packages assayed 2.96 per cent., 3.01 per cent., 3.26 per cent., 3.3 per cent., 2.9 per cent., 3.5 per cent., 2.72 per cent. respectively. E. H. Gane. 3.02 per cent., 3.2 per cent., 3.4 per cent. E. L. Patch.

Gum. Advertised as a superior product for tablet making and other pharmaceutical uses. Proved to be white potato dextrin. E. L. Patch.

Heroin. Variations in melting point of 10 degrees to 15 degrees are found in heroine and heroine hydrochloride. W. L. Scoville.

Hydrogen Dioxide. Thirty-two samples ranged in strength from 0.63 per cent. to 3.45 per cent. Twenty-nine more were below 3 per cent., three less than 2 per cent., and two others less than 1 per cent. Solids ran as high as 0.366 per cent. Eighteen exceeded the limit for acidity. Twenty-four contained acetonilide. N. A. R. D. Notes.

Hyoscyamus. One sample of annual leaf assayed 0.023 per cent. alkaloids. E. H. Gane. 0.057 per cent., 0.097 per cent., 0.111 per cent. E. L. Patch.

Insect Powder. Stems are largely used for powdering and the claim is made that these are as active as the flowers. E. H. Gane. Considerable quantities of insect flower stems continue to arrive. It seems impossible that they could be used for any other purpose than that of substituting or adulterating insect flower powder. H. H. Rusby.

Ipecac. 2.4 per cent., 1.97 per cent., 2.26 per cent., 1.97 per cent., 2.4 per cent., 2.28 per cent., 2.33 per cent., 2.18 per cent., 2.43 per cent. E. L. Patch.

Irota Lactate. One sample was only partially soluble and contained much ferric lactate. E. H. Gane.

Jaborandi. 0.26 per cent., 0.165 per cent., 0.3 per cent., 0.2 per cent. E. L. Patch.

Jalap. The poorest lot offered tested 6.75 per cent. and the best 20.06 per cent. resin. E. H. Gane.

Total resin 3.05 per cent. Ether soluble 1.2 per cent.

Total resin 11.85 per cent. Ether soluble 1.1 per cent.

Total resin 12.2 per cent. Ether soluble 1.53 per cent.

Total resin 9.78 per cent. Ether soluble 1.18 per cent.

Total resin 7.4 per cent. Ether soluble 0.95 per cent.

Total resin 13.84 per cent. Ether soluble 1.24 per cent.

E. L. Patch.

Lemon Extract. Two lots were free from oil. Others 0.6 per cent. upward. M. S. E.

Labella Herb. 0.6 per cent. alkaloid. E. L. Patch.

Magnesia, Calcined, Magnesia labelled "For technical purposes only" but sent for medicinal use, assayed 92.2 per cent., 89.7 per cent., 86.6 per cent., 95.9 per cent. and 93.1 per cent. respectively. E. H. Gane.

Magnesium Sulphate. Dried, tested 95 per cent. monohydrated. E. L. Patch. The dried salt if monohydrated should contain 87 per cent. of anhydrous salt, if dihydrated 77 per cent. M. C. W. had 67.2 per cent. anhydrous, 7.29 per cent. water. P. W. R. 64.93 per cent. anhydrous, 14.43 per cent. water. Merck 54.27 per cent., 26.16 per cent. water. W. A. Puckner and L. A. Warren.

Methylene Blue. Contains 0.1 per cent. to 1.0 per cent. ash. Zinc is usually present. W. L. Scoville.

Mustard. The presence of charlock in mustard used as a condiment is very common. H. H. Rusby.

Myrrh. Is 30.1 per cent. to 42 per cent. soluble in alcohol. W. L. Scoville.

Nux Vomica. One lot of powdered assayed only 1.19 per cent. of strychnine. E. H. Gane. 1.26 per cent., 1.22 per cent., 1.268 per cent., 1.23 per cent., 1.22 per cent. E. L. Patch.

Oil of Anise. One lot of Manila oil proved of excellent quality, giving the following results: Congealing point 15 degrees: C. Sp. gr. 0.975. Soluble in all proportions in 90 per cent. alcohol. E. H. Gane.

Oil of Capeput. Lots meeting other U. S. P. requirements are low in gravity, running 0.911 or under instead of 0.915 to 0.925. E. L. Patch.

Oil of Cassia. Lots sold as redistilled gave 11 per cent. residue and lots marked lead free, not redistilled, only 11.5 per cent. E. L. Patch. Cassia oil and cinnamon oil are not alike. The names should not be used interchangeably. Oil of cinnamon is distilled from scrap bark and if pure may contain 80 per cent. to 90 per cent. of aldehyde. It is often adul-

terated with leaf oil. Oil of cassia is distilled almost entirely from the leaves and contains from 75 per cent. upward of aldehyde. Shipped in lead containers it often contains lead. American Druggist.

Oil of Citronella. Frequently adulterated with turpentine and petroleum oil. American Druggist.

Oil of Eucalyptus. One sample offered contained only 40 per cent. of eucalyptol. E. H. Gane.

Oil of Fennel. Congealing point, +6 degrees C., +3.5 degrees C., +5 degrees C., +5.50 degrees C., +6 degrees C., +6.5 degrees C., -16 degrees C., +3 degrees C., +2.85 degrees C. E. L. Patch. The requirements of +5 degrees C. is generally agreed to be too severe. Dodge & Olcott.

Oil, Linseed. Is commonly extended with corn oil. Soya bean oil has been used but to much less extent. E. H. Gane.

Olive Oil. Various samples were mixtures of olive oil and cottonseed oil or were all cottonseed oil. M. S. B.

Oil of Origanum. It is stated in N. A. R. D. Notes that no oil of origanum, genuine, is obtainable, and oil of red thyme is offered instead. E. L. Patch.

Oil of Peppermint. Marked "Twice Rectified" "U. S. P.," "Redistilled." Not always colorless. One lot gave more than opalescence with four parts of 70 per cent alcohol. Optical rotation -25.7 degrees to -27.4 degrees; sp. gr., 0.9018 to 0.9045; menthyl acetate, 7.08 per cent. to 7.86 per cent.; total menthol, 55 per cent. to 60.3 per cent. E. L. Patch.

Oil of Pine Needles. There is practically no oil of pinus sylvestris on the market. American Druggist.

Oil of Thyme Flowers. Guaranteed to be genuine. Sp. gr., 0.888 (U. S. P. 0.9 to 0.930); optical rotation, -1.2 degrees (U. S. P. up to 3 degrees); phenol, 22.5 per cent. E. L. Patch.

Paw Paw. Paw paw preparations vary greatly in digestive activity. W. L. Scoville.

Pepsin. Samples on the market with digestive power of 1-9000, but they contain a large proportion of inorganic salts. Probably these salts are a large factor in the activity of the pepsin. W. L. Scoville. Three lots labeled 1-6000 were 1-2000. One lot labeled 1-3000 was 1-1000. Several other lots were weaker than labeled. Oil, Paint and Drug Reporter.

Peroxide Creams. Of twenty-one brands only three contained hydrogen dioxide and in a majority of cases apparently no dioxide had ever been present. American Druggist. The Peroxide Specialty Company, Cincinnati, was convicted and fined for shipping such a product. Pharmaceutical Era.

Petrolatum Liquidum. It is difficult to obtain meeting the U. S. P. requirements for sp. gr. of 0.870 to 0.940. A few lots run as follows: 0.860, 0.875, 0.876, 0.877, 0.861, 0.877. E. L. Patch.

Phenacetin. Melts at 131 degrees to 135 degrees C. W. L. Scoville.

Pills, Cathartic Compound. These and other black pills labeled gelatin coated were coated with lamp-black and glucose. Are being offered at wholesale below the bare cost of material. N. A. R. D. Notes.

Pinkroot. Fifty-seven samples were obtained from various sections of the country and carefully examined, compared with four plants of true spigelia from the bureau of plant industry, cross sections of the rhizomes and roots being made and compared microscopically. Specimens found to be true pinkroot, none, although many were up to the U. S. P. description. C. E. Sanders.

Potassium Carbonate. Usually contains 8 per cent. to 15 per cent. of water. Since the Pharmacopoeia directs that it is to be dried before being weighed for titration, salt containing as much as 15 per cent. of water is sold as U. S. P. W. L. Scoville. One lot 0.7 per cent. chloride; dirty. E. L. Patch.

Potassa—Highest Purity. Potassium hydroxide runs 85 per cent. to 89 per cent. or 90 per cent. strength. W. L. Scoville.

Potassium Nitrate, U. S. P. Conviction and fine for shipping ten barrels containing 7 per cent. sodium chloride. U. S. P. should be 99 per cent. pure. Apothecary.

Precipitated Ferrous Phosphate. Dispensatory states that it may assay 44 per cent. ferrous phosphate. Five lots carefully made assayed 63.5 per cent., 65.95 per cent., 69.74 per cent., 71 per cent., 80.34 per cent., 86.8 per cent. Other lots in market, 42.34 per cent., 45 per cent., 49.98 per cent., 44 per cent. E. L. Patch.

Rhubarb. American rhubarb has been offered to the trade. The root is of a poor, grayish color, very spongy and with little if any of the characteristic rhubarb odor. Microscopically its structure is similar to the imported, but it is distinguished by the small amount of calcium oxalate crystals present. The powder is of a fair color. E. H. Gane.

Soap, Castile. The powdered contains 2.5 per cent. to 5 per cent. of water. The cake 11 per cent. to 26 per cent. Much offered as castile soap is made from animal fats. W. L. Scoville. Much of the so-called "pure olive oil soap" contains a large proportion of coconut oil soap. This is easily recognized by the characteristic taste. E. H. Gane.

Soda, Caustic. Runs from 88 per cent. to 98.6 per cent. W. L. Scoville.

Sodium Carbonate. Varies greatly in the amount of water which it contains. W. L. Scoville.

Sodium Glycerophosphate. Is often alkaline in reaction to a very marked extent, enough to give trouble in preparations containing it. W. L. Scoville.

Sodium Phosphate. "Dried, purified," contained 10 per cent. sulphate, 1.5 per cent. water. "U. S. P.," contained excess of sulphate and chloride, 0.5 water. E. L. Patch.

Sodium Sulphate, Dried. Tests satisfactory—nearly anhydrous. E. L. Patch.

Stramonium. Two lots of domestic assayed 0.17 per cent. and 0.14 per cent. alkaloids. E. H. Gane. 0.198 per cent., 0.21 per cent., 0.41 per cent., 0.28 per cent. E. L. Patch.

Turpentine. Adulterated and face have resulted. To identify the copal the liquid is distilled up to 190 degrees C. and the acid and bromide numbers of the residue determined. Pharmaceutical Era.

Umbelliferous Cremocarps. Caraway, anise, fennel, etc., etc. This class of official fruits is extremely liable to contamination with large amounts of stems, gravel, sand, dust, weed seeds and other impurities. H. H. Rusby.

Uva Ursi. The addition of cut stems to this drug seems to

have nearly ceased, a result apparently of the persistent rejection of the article when so treated. H. H. Rusby.

Zinc Oxide. Difficult to obtain strictly U. S. P. The usual impurities are lead, antimony and iron in excess. Seven lots offered as U. S. P. assayed 96.4 per cent., 98.14 per cent., 99.09 per cent., 96.1 per cent., 95.8 per cent., 97.2 per cent. and 95.3 per cent. zinc. E. H. Gane.

L. D. Havenhill, of Lawrence, Kan., in presenting the report of the committee on the United States Pharmacopoeia, said that the work of the committee had been heavily handicapped by the death of Mr. Hallberg and the resignation of Mr. Beringer.

The following paper was presented by its author:

The Physical and Chemical Constants of Several Unusual Fixed Oils.

By CHARLES H. LAWALL.

The present-day tendency in manufacturing operations is toward the utilization of materials which were formerly discarded as valueless and our knowledge is constantly being enriched by the publication of facts concerning substances which are being produced as by-products and for which appropriate uses must be found.

Three rather uncommon fixed oils have come into my possession recently which illustrate this modern tendency in an excellent manner. All of them were received from Mr. W. J. Warner, superintendent of a glycerin refinery at Berkeley, Cal.

Silkworm Oil. Oil from silkworm chrysalids has been mentioned in literature several times as a commercial possibility. In the *Journal of the Society of Chemical Industry*, volume xxx, number 9, page 555, it was stated that in the ten years preceding 1906 there were produced as a by-product of the silk industry in Italy alone, 32,000,000 pounds of the chrysalids, which were practically all used for fertilizing purposes. As they contain about 20 per cent. of fixed oil obtainable by expression or the use of solvents and as the residue after the extraction of the oil would possess a manurial value equal to or greater than the original material, the probability of such an oil becoming an article of commerce is clearly evident.

The sample of silkworm oil in my possession has a brownish yellow color and a somewhat disagreeable odor. It has a specific gravity of 0.9221 at 15° C., an acid number of 17.76, a saponification number of 202.46 and an iodine value of 142.2. The refraction figure on the Zeiss butyro-refractometer was 70° at 25° C.

Tea Seed Oil. Tea seed oil, as produced and used for edible and manufacturing purposes in Japan, is not derived from *thea sinensis*, the species which produces commercial tea leaves, but from *thea sasanqua*, a plant of totally different character cultivated only for its seed. This oil, when obtained by expression, contains such notable quantities of saponin as practically to unfit it for edible purposes, though when made by extraction with volatile solvents it is practically free from that irritating substance.

The exact origin or method of preparation of the sample in my possession is unknown. Its properties are as follows: Specific gravity, 0.9165 at 15° C.; acid number, 1.52; saponification number, 196.55; iodine number, 86.7; butyro-refractometer reading, 62° at 25° C.

Grape Seed Oil. Grape seed oil has been produced for some time as a by-product of the wine industry in some parts of Europe, but until recently no attempt was made in this country to utilize the seed. Several years ago the production of this oil was begun in connection with the seeded raisin industry and the output of oil was reported last year to have reached over 300,000 pounds. The sample submitted was a bland, pleasant nutty flavored oil of bright sparkling appearance, showing the following characteristics: Specific gravity, 0.9215 at 15° C.; acid number, 100.10; butyro-refractometer reading, 71° at 25° C.

The foregoing data are submitted as a contribution to the literature of these respective oils.

Among the other papers read or presented were the following:

"The Scope of the Foreign Pharmacopœias," by M. I. Wilbert, of Washington. An analysis of the contents of the recently published pharmacopœias had been made and the scope and general requirements of these books compared. The need for greater uniformity was discussed and some of the agencies that were being developed in favor of international requirements were referred to.

"The National Formulary and Its Relation to the United States Pharmacopœia," by W. C. Alpers, of New York.

"The Pharmacopœial Standard for Desiccated Thyroid Glands," by Reid Hunt and Atherton Seidell, of Washington. The parallelism between the iodine content and physiological activity of thyroid having been established, the authors called attention to the advantages of the method of Hunter (*Journ. Biol. Chem.* 7, 321, 1910), over the older Baumann method for the estimation of the organically combined iodine of thyroid, and suggested the incorporation of the Hunter method in the pharmacopœial description of this drug. On the basis of the analysis of a large number of commercial desiccated thyroid samples, a standard iodine content of 0.2 per cent., with a maximum variation of 0.03 per cent. above or below this figure was recommended. The limit for moisture was placed at 6 per cent., and that for ash at 5 per cent. Attention was called to the improbability of the claim that some recently prepared thyroid preparations contained the thyroid iodine compound in a super-active form.

"The Preparation, Quality and Testing of Quinine Tannate," by W. A. Puckner and L. E. Warren. Quinine tannate had been introduced into medicine many years ago because it exhibited the alkaloid in a comparatively tasteless form. It was now official in many pharmacopœias, the alkaloidal requirement in none being less than 30 per cent. The therapeutic efficiency and reliability of quinine tannate have been seriously questioned. Evidence has been adduced on both sides of the controversy and the question was still an open one. The council on pharmacy and chemistry of the American Medical Association having decided to consider quinine tannate, the association's chemists had taken up the examination of the commercial product and also had prepared the substance by several methods. From the results of the experimental work in preparing the salt, it had been concluded that quinine tannate containing over 30 per cent. of alkaloid might easily be prepared, but that the methods of preparation prescribed in the pharmacopœias yielded products containing somewhat less than this quantity of alkaloid. To obtain products of even an approximately constant composition it was necessary to employ definite proportions of tannic acid and of quinine. Four commercial specimens of quinine had been examined. Three of these had been found to be of good quality, although two contained slightly less than 30 per cent. of alkaloid. The remaining specimen contained about 9 per cent. of uncombined alkaloid, namely, about 26.5 per cent. of the total alkaloid present was found in the uncombined state.

"Standardization of Solutions for Alkaloidal Assay," by A. B. Stevens and A. F. Schlichting, of Ann Arbor.

"Methods of Aconite Assay," by A. B. Stevens and S. Greenbaum, of Ann Arbor.

"The Assay Processes of the United States Pharmacopœia," by A. R. L. Dohme, of Baltimore.

"Some Queries on Alkaloidal Assaying," by W. A. Pearson, of Philadelphia.

"A Method of Assay for Fluidextract of Sanguinaria," by H. B. Meade, of Philadelphia. Blome's modification of Schlotterbeck's method for the drug was adapted to the fluidextract. It depended on the extraction of the alkaloids and ether-soluble principles with ether, separating the alkaloids from other extractive by means of excess of standard acid, precipitating the alkaloid with Mayer's reagent, and titrating the acid unused by the alkaloid with N/50 alkali.

"On the Crystalline Alkaloid of Calycanthus Glauca (fourth paper)," by H. M. Gordin, of Chicago.

"Gelsemium Alkaloids," by L. E. Sayre, of Lawrence, Kan. The relation (physiological and chemical) of gelsemine and gelseminine and a third alkaloid for which the author suggested the name gelsemoidine was discussed. The method of extraction and separation of these alkaloids was brought out.

"The Ash Content of Drugs," by M. I. Wilbert, of Washington. The possibilities and the limitations of the ash content of drugs as an indication of adulteration were discussed, as were the precedent established by our own and by foreign pharmacopœias; the variations existing at the present time, and the need for adopting a definite method of procedure with some of the methods that have been proposed.

"Physiological Drug Testing and the United States Pharmacopœia," by Charles C. Haskell.

"The Medullary Ray Cells in Rhamnus Purshiana," by Henry Kraemer, of Philadelphia.

"A Note on Capsicum," by Wilbur L. Scoville, of Detroit. There was great variation in the capsicum of the market.

Pungency was a question of cultivation as well as of variety. A simple test for quality was given.

"The Permanency of Some Astringent Preparations," by Wilbur L. Scoville. Twenty fluidextracts of drugs containing tannin had been compared during three years. Permanency had been found comparable in part to alcohol strength. The desirability of strongly alcoholic menstrua in drugs of this class was emphasized. Loss of astringency was not always shown by precipitation. Results were tabulated.

"Combretum Sundiacum," by I. V. S. Stanislaus and H. C. Wood, Jr., of Philadelphia.

"Calcium Hydroxide," by Philip Asher, of New Orleans. In a series of experiments extending over seven months it had been shown that calcium hydroxide kept in an ordinary stoppered bottle lost very little oxygen. From a chemical viewpoint this was of interest in that the theory regarding the rapid decomposition had been largely exaggerated. The sample exposed during the greater portion of the time during the wet season.

"Anethol Versus Oil of Anise," by Otto Raubenheimer, of Brooklyn.

"On the Keeping Quality of Some U. S. P. Volumetric Solutions," by A. H. Clark, of Chicago. In this paper was given the conclusions drawn from some experiments extending over a period of nearly four years, reports of which have been given in two previous papers appearing in the Proceedings for 1909 and 1910.

"Chinese Opium Pills and Tablets," by Albert Schneider, of San Francisco.

"Some Experiments on the Rate of Disintegration of Pills," by L. D. Havenhill and A. E. Stevenson.

"Proposed Standard for Camphor and Spirit of Camphor," by L. D. Havenhill and F. L. Rowland.

"Notes on the Keeping of Sweet Spirit of Niter and a Suggestion for Change in Title," by Linwood A. Brown, of Lexington, Ky.

Officers were elected as stated on page 492, and after a many-sessioned meeting, the section adjourned.

HISTORICAL SECTION.

Friday Afternoon, August 18th.

On the return trip from Plymouth Friday afternoon, the first session of the section on historical pharmacy was held in the main saloon of the boat "Betty Alden," with Chairman J. L. Lemberger, of Lebanon, Pa., in the chair. Secretary Raubenheimer, was on hand, as was Historian

J. L. LEMBERGER.
Retiring Chairman of the
Historical Section.

OTTO RAUBENHEIMER.
New Chairman of the
Historical Section.

Kremers. In spite of various kinds of noises, including that made by the boat, another variety caused by the romping of children on the deck overhead, thunder, screams of women as lightning played, and the conversation of members and others on the outskirts of the crowd, who being unable to hear what was going on, seemed to see no reason why they should permit others to do so, the session was an interesting one to those who really desired to participate in its proceedings.

Addresses were made by the respective officers, and John F. Hancock, of Baltimore, presented some letters and other documents of great historical value to the associa-

tion. Among the latter were announcements of the meetings of 1866 and 1871, sent out by Secretary Maisch.

An unusually interesting paper in which some of the personal experience with and recollections of New York pharmacy and pharmacists of the forties and fifties of the last century, by its author, Ewen McIntyre, was read by Thomas F. Main.

Francis B. Hays, of New York, presented a scrap-book which he had entitled "Hallbergana," in which had been gathered clippings from all or nearly all the pharmaceutical journals of this country, and some from abroad, as well as some medical journals, containing reference to

portance to druggists of seeing that they use none other than accurate weights and measures.

H. B. Guilford, of Rochester, president of the National Association of Retail Druggists, having dropped into the meeting, was called to the platform and asked to address the members. In responding, Mr. Guilford spoke of the desirability of united action on the part of druggists, and extended an invitation to the members of the American Pharmaceutical Association to attend the meeting of his organization to be held at Niagara Falls, September 11th and succeeding days.

The general session then adjourned.

Friday Afternoon, August 18th.

At the general session held on the boat Friday for the purpose of choosing a place of meeting next year, J. P. Remington introduced a resolution of confidence in Dr. Harvey W. Wiley and those who were working with him for an honest enforcement of the food and drugs act, and requesting President Taft to take such action as would insure the continuance of a proper administration of that law. This resolution was adopted without a dissenting vote.

FINAL GENERAL SESSION.

Saturday Forenoon, August 19th.

Many ragged ends of business had to be picked up and put into shape and much new business had to be rushed through at the concluding general session held Saturday forenoon, with President Eberle in the chair.

Dr. Horace D. Arnold, of Boston, a delegate from the American Medical Association, who had been unable to attend the first general session when delegates had been introduced, was present and made a short but felicitous address. He spoke of the high regard in which the leading pharmacists of Boston were held by the medical profession and expressed gratification at the fact that the

JOHN URI LLOYD.

The Association's Unofficial Historian.

EDWARD KREMERS.

The Association's Official Historian.

the life and death of the late C. S. N. Hallberg. There were also bound in as part of this book many letters from members of the association in which characteristic anecdotes of the deceased member were related, as well as other documents of a germane nature, including a pamphlet containing the constitution and by-laws of the original "Diastase Club of Chicago." Mr. Hays read from the book a letter from the late J. Winchell Forbes on Mr. Hallberg's death, in which the author said that he felt that his life was soon to end and expressed some views concerning the hereafter.

On motion of H. V. Army, of Cleveland, the thanks of the section were tendered to the compiler for his interesting and valuable collection of "Hallbergana."

A. W. Miller, of Philadelphia, presented an interesting paper on the Island of Socotra, from which Socotrine aloes is supposed to come, but Mr. Miller showed that it was extremely doubtful whether any aloes at all had been exported from the island for a long time.

Officers were elected (see page 492) and the section adjourned to reassemble in the evening to hear Edward Kremers deliver an illustrated address on the "Pharmacist in Literature," which proved one of the most enjoyable features of the meeting.

ADJOURNED GENERAL SESSIONS.

Wednesday Noon, August 16th.

For a few minutes about noon Wednesday the section on education and legislation gave way to the general session, which held an adjourned meeting at which President Eberle presided.

H. P. Hynson's report as chairman of the committee on national legislation was referred to the section on education and legislation.

E. M. Houghton, of Detroit, chairman of the committee on physiological assay, was not present. His report was presented by title and referred to the scientific section.

A telegram of greeting from ex-President Oscar Oldberg, of Chicago, in which he stated that rheumatism prevented him from attending the meeting, was read, and the secretary was instructed to forward a suitable reply.

Another committee chairman, Henry Kraemer, of Philadelphia, was unable to be at the Boston meeting, so his report on weights and measures was read by C. E. Caspari, of St. Louis. In this report reference was made to the growth of the use of the metric system, and the im-

H. B. GUILFORD.

President of the N. A. R. D., who was welcomed to the meeting and made a short address.

LEWIS C. HOPP.

An ex-President of the Association who is a faithful attendant at its meetings.

association had thought well enough of one of them to elevate him to its highest office. He believed the time had come for pharmacists and physicians to unite in educating the general public to an appreciation of many things connected with medicine and hygiene.

It was announced that W. B. Day, of Chicago, had been appointed to succeed the late C. S. N. Hallberg on the national syllabus committee, and that H. L. Taylor had been reappointed a member of the same.

Vice-President Day took the chair while G. M. Beringer presented the report of the committee on president's address. In brief, this report recommended that the idea of co-operation between the American Pharmaceutical Association and the National Association of Retail Druggists be endorsed; that the general secretary of the association be also the editor of the association's journal, provided that a suitable man to fill the dual office were at all times available; that steps be taken to devise a model law relating to boards, pedlers, liquors and narcotics; that the efforts of the association on behalf of pharmacists in the public service be continued; that the association reiterate its adherence to the principles of the food

and drugs act of June 30th, 1906; that the association endorse the idea that the sale of all medicines should be under the control of the several boards of pharmacy, respectively; that the association favor a department of health, with a bureau devoted to pharmacy; that the pure drug laws of the several States be harmonized, and that their administration be delegated to pharmacists; that while the idea of a recipe book to be issued by the association was a good one, the work involved in preparing its contents was too onerous to be undertaken just now; that the syllabus be perfected and urged for adoption by the colleges; that the American Pharmaceutical Association should have delegates at the congress of applied chemistry; that the question of patent and trade-mark reform be brought before the congress of applied chemistry; that the matter of reorganizing the association receive proper consideration; and that the names of candidates for the presidency be sent to electors on separate slips, so as not to give any candidate the advantage of heading the list. The report was received and its recommendations adopted.

Mr. Remington reported that he had received a communication from Albert Schneider, of San Francisco, regarding the proposed meeting in that city in connection with the Panama Canal celebration in 1915, of the International Congress of Pharmacy. A committee of three is to be appointed to take cognizance of this matter and report at a future meeting of the association.

IDENTIFICATION OF GROWING PLANTS.

William Mansfield stated that he had collected and put on exhibition in the lobby specimens of fifty-five different plants which grow in the vicinity of Boston, and had through the courtesy of the representatives of three New York drug journals present been able to offer an annual subscription to one of these journals to the member identifying the largest number of the specimens, and subscription to the other two as second and third prizes. He announced that C. H. LaWall, of Philadelphia, had captured first prize by naming fifty-four of the specimens, and that E. V. Howell, of Chapel Hill, N. C., and L. E. Warren, of Chicago, had taken the other two prizes. Incidentally it may be stated that the one specimen which baffled Mr. LaWall's keenness was a common field plant which is cultivated on a large scale in the West, being no other than alfalfa. The specimen found near Boston, however, did not present all the characteristics of the Western variety, especially in regard to size.

On motion of Mr. Remington the thanks of the association were tendered to Mr. Mansfield, and he was requested to continue his efforts along this line at future meetings; the motion also included thanks to the journals.

Mr. Hynson claimed the credit for Baltimore for having first made, in 1898, such an exhibition as Mr. Mansfield had prepared, and as had been made by President Rusby at the Richmond meeting last year, but Mr. Whelpley recalled that Mr. Mohr had made such an exhibition ten years before the Baltimore meeting.

Council minutes were read by Secretary England. The council did not approve the creation of a new section, to be known as the section on United States Pharmacopœia, as had been proposed by ex-President Oldberg, but had taken steps to provide for joint meetings of the association's two committees on the Pharmacopœia and on the National Formulary.

APPROPRIATIONS AND PUBLICATIONS.

The salary of Secretary-Editor Beal had been fixed at \$3,000, and an additional \$750 was allowed for help. The headquarters of the secretary will be at Scio, Ohio.

Letters of greeting had been sent to ex-President Dohme, and to ex-Treasurer Sheppard, who were prevented by sickness from attending the meeting.

The sum of \$5,000 was appropriated for the use of the new *Journal of the American Pharmaceutical Association*.

The salary of Treasurer Whelpley had been increased from \$750 to \$1,000, and that of Mr. Diehl, reporter on the progress of pharmacy, from \$750 to \$1,200.

The minutes of the council meetings were approved by the general session unanimously, without debate.

It was announced that the Hallberg memorial fund amounted to \$4,400, which was sufficient to pay the balance due on the Hallberg house and lot at Chicago, and leave something for Mrs. Hallberg and her young son.

J. W. England, who has been acting as editor of the *Bulletin* since the death of Mr. Hallberg, reported that

he had issued 3,000 copies of that publication each month and had not spent all of the \$2,000 which had been appropriated for his use.

The *Bulletin* will continue to appear monthly until the end of the year, when it will give place to the *Journal*.

The thanks of the association were tendered to Mr. England for stepping in and filling the office of editor made vacant by the death of Mr. Hallberg, and also to Mr. Day for his assistance in getting out one issue before Mr. England's services had been secured.

George F. Payne, of Atlanta, reported for the committee on pharmacists in the public service. Many of these pharmacists had joined the association in the belief that their status would be improved through the efforts of the association. Hospital stewards in the army did not re-

J. W. ENGLAND,
Secretary of the Council;
Acting Editor.

JAMES M. GOOD,
A former President, now
Vice-Chairman of the Council.

ceive as good pay as was given to men of equal rank in other branches of the service.

Greetings were received from ex-President Patton, of York, Pa., "Uncle John," and the secretary was instructed to respond in a fitting manner.

EBERT PRIZE AWARDED.

The committee on Ebert prize reported that it had experienced much difficulty in coming to a decision, but had finally agreed to recommend that the prize for the best paper submitted to the association last year be awarded to W. A. Puckner and L. E. Warren for their studies on the composition of strychnine arsenate and copper citrate (see the Proceedings for 1910, pages 1007 to 1021, inclusive). This report was adopted, as was a recommendation by the committee that in future all papers competing for the prize be divided into four classes, according to the subjects treated, and that all the papers in each class submitted during four years be considered together, the prize, as heretofore, to be awarded each year, provided a worthy paper is offered for consideration.

Mr. Hynson, reporting for the section on education and legislation, told what that section's views were regarding commercial training in colleges of pharmacy, and the formation of a general permanent conference on national legislation. These matters were referred to the council, to provide ways and means of taking effective action concerning them.

L. F. Kebler, of Washington, gave an account of his reception by the National Wholesale Druggists' Association as a representative of the American Pharmaceutical Association.

Francis B. Hays, of New York, chairman of the committee on publicity, said that the net, tangible result of several years' of work on the part of the committee was a bill for postage and printing each year. There had been no organized campaign for publicity during the year just closed, and so he had no bill for expenses to present. However, some of the members of the committee had written letters to the press on subjects on which it was to the interest of the association that the public be enlightened.

As reporter to the public press Mr. Hays stated that he had called on the city editors of all or nearly all the Boston daily papers and had invited them to have represen-

tatives at the meeting. He had been well received, and took pleasure in saying that most of the papers had given good reports of the meeting; especially had the *Globe*, the *Herald* and the *Transcript* devoted a considerable amount of space to it. He recommended that the publicity work of the association be taken over by the secretary and editor, who would be well equipped to perform it.

The report was accepted and the recommendation adopted, and a motion that the daily press be requested to refrain from publishing the names of poisons used in cases of suicide, as such information suggested means for other suicides, prevailed.

On motion of Mr. Beal it was ordered that all recommendations from sections to the general session be approved, as in the confusion some of them might have been overlooked.

When the new officers had been installed Mr. Anderson moved that the thanks of the association be tendered to the local committee, to the press and to the retiring officers. He spoke in an especially feeling manner of the long and faithful service of the retiring secretary, Mr. Caspari. His motion prevailed.

Ex-President Eberle and ex-Secretary Caspari responded in a fitting manner, and at 1:50 o'clock the meeting adjourned.

ENTERTAINMENT.

Local committees, headed by C. H. Packard, for the men, and Mrs. John G. Godding, for the women, did everything that could be expected and much more than could have been asked, to make the stay of the visiting members and their friends pleasant and profitable. In addition to the set entertainment features, there were many little side trips on automobiles, and visits to the historic spots in and around Boston.

On Monday evening there was the usual president's reception and ball, preceded by a dinner to the visiting college graduates tendered by the Alumni Association of the Massachusetts College of Pharmacy.

On Tuesday forenoon the ladies were taken on a tour of Boston; in the afternoon they visited the Museum of Fine Arts and the Boston Public Library; and in the evening took in Norumbega Park and Zoological Gardens.

"My friend, this is a most excellent drink."

Tuesday evening the men were the guests of the local druggists at a smoker.

Wednesday morning the ladies took a ride to Lexington and Concord over the exact route made famous by Paul Revere, and after luncheon visited Cambridge, the Agassiz Museum, Washington Elm, and Longfellow's home. A card party at the Hotel Lenox was the feature of the evening.

On Wednesday evening there was a reunion and twenty-fifth anniversary dinner of the class of '86, Massachusetts College of Pharmacy.

Another automobile ride for the ladies was given Thursday forenoon. This led along the north shore road to Magnolia Beach and the summer home of President Taft. In the evening the Boston chapter of the Women's Organization of the National Association of Retail Druggists gave a musicale and reception at the Hotel Vendome, complimentary to the visiting women.

The grand outing feature of the meeting was an all-day sail to Plymouth and back, with luncheon on the boat, and a visit to the famous "Plymouth Rock" and other points of interest in the city which is one of the earliest American settlements.

Into all these entertainments the Boston contingent entered with a heartiness which at once made the visitors

C. H. PACKARD.

feel at home, and even if the business session of the association and its sections and related bodies had not been successful, which they were, the social features of the occasion would have more than compensated all who came to the meeting for their trip.

SOME WHO WERE THERE.

According to the register, supplemented by data from other sources, the following members and guests were present at the meeting:

Alabama—Mrs. S. S. Hertz, of Montgomery; Mr. and Mrs. L. C. Lewis, of Tuskegee.

Arkansas—John B. Bond, Sr., and J. F. Dowdy, of Little Rock.

California—Mrs. Fletcher Howard, of Los Angeles.

Colorado—S. L. Bresler and C. M. Ford, of Denver.

Connecticut—C. A. Rapelye, of Hartford.

District of Columbia—Mrs. J. V. Calver, L. F. Kebler, and M. I. Wilbert, of Washington.

Florida—Mr. and Mrs. W. O. Rechtman, of Satsuma Heights; and Mr. and Mrs. E. Berger, of Tampa.

Georgia—Mr. and Mrs. George F. Payne, and Miss Gladys N. Payne, of Atlanta.

Idaho—C. O. Ballou, of Boise.

Illinois—C. H. Avery, A. H. Clark, Mr. and Mrs. W. B. Day, Frederick Fenger, W. A. Puckner, S. K. Sass, Mr. and Mrs. Clyde M. Snow, L. E. Warren, and Mr. and Mrs. Thomas V. Wooten, of Chicago; Mr. and Mrs. Gus Lindvall, Bessie Lindvall, Frederick Lindvall, and Mr. and Mrs. George W. Sohrbeck, of Moline; and E. W. Morse, of Mt. Vernon.

Indiana—Miss Gill, of Evansville; J. V. Barber, Jr., of Farmersburg; Mr. and Mrs. F. H. Carter, Mr. and Mrs. F. R. Eldred, Miss Laura C. Hartmann, and Charles C. Haskell, of Indianapolis; Mr. and Mrs. J. W. Sturmer, of Lafayette; and Miss Laura Eldred, of Ligon.

Iowa—J. W. Ballard, of Davenport; R. L. Parker, of Des Moines; W. J. Teeters, of Iowa City; Mr. and Mrs. G. Scherling, and Miss Gertrude Scherling, of Sioux City.

Kentucky—C. Lewis Diehl, of Louisville.

Louisiana—Philip Asher, and Mr. and Mrs. F. C. Bold, of New Orleans.

Maine—Frank R. Partridge, of Augusta; W. M. Close, and Charles H. Davis, of Bangor; M. L. Porter, of Danforth; Angus McLean, and W. E. Tibbitts, of Milltown Station; and Frank W. Buckman, of Skowhegan.

Maryland—Charles Caspari, Jr., Mr. and Mrs. A. R. L. Dohme, Mr. and Mrs. H. A. B. Dunning, Mr. and Mrs. P. J. Heusler, Mr. and Mrs. John F. Hancock, Miss Lillie Hancock, Henry P. Hynson, and Miss Natalie Hynson, of Baltimore; and Mr. and Mrs. M. C. Powell, and Miss Elizabeth Powell, of Snow Hill.

Massachusetts—Mr. and Mrs. L. W. Griffin, of Allston; Arthur O. Austin, of Auburndale; Mr. and Mrs. W. R. Acheson, Walter N. Baker, E. F. Bigelow, F. L. Brown, A. A. Burnham, Mr. and Mrs. F. L. Carter, F. L. Carter, Jr., Max Cramer, Mr. and Mrs. L. D. Drury, Mrs. J. R. Ellis, Cora E. Ellsworth, Frank F. Ernst, Mrs. G. K. Ernst, J. C. Hager, Mr. and Mrs. I. P. Gammon, J. A. Knudson, Mr. and Mrs. Robert C. McGowan, Mr. and Mrs. M. J. McIntyre, E. C. Marshall, Mr. and Mrs. W. F. Sawyer, Theodore H. Stachli, V. S. Taylor, Mrs. A. L. S. Thrasher, and Daniel O. Wolff, of Boston; Mr. and Mrs. John G. Godding, of Brighton; Mr. and Mrs. Harry W. Blake, of Brookline; M. E. Berkowitz, Mr. and Mrs. H. R. Copiltorn, Mr. and Mrs. F. J. Connolly, Mr. and Mrs. P. J. McCormick, Mr. and Mrs. E. H. La Pierre, Miss Sally La Pierre, and Mr. and Mrs. C. A. Stover, of Chelsea; Mr. and Mrs. Charles H. Davis, S. A. Oppe, and Mr. and Mrs. John E. Riley, of Dorchester; C. H. Packard, and Mrs. Zilla I. Staples, of East Boston; Mr. and Mrs. J. F. Fenneran, of Everett; John R. Sands, of Fort Banks; Harry L. Brues, of Groton; Mrs. E. A. Kempton, of Haverhill; Mr. and Mrs. L. G. Heinritz, of Holyoke; C. B. Wheeler, of Hudson; Mr. and Mrs. W. H. Glover, of Lawrence; C. F. Nixon, of Leominster; D. W. Foster, of Lynn; Miss Carolyn M. Perry, of Natick; Mr. and Mrs. Fred A. Hubbard, of Newton; Mr. and Mrs. J. T. Waterhouse, of Newton Highlands; Carrie L. Sears, of Newton Lower Falls; E. O. Engstrom, of Pittsfield; Mrs. J. W. Cooper, of Plymouth; Mr. and Mrs. G. H. Kelly, of Roxbury; Mr. and Mrs. J. A. Bean, and C. E. Brown, of Somerville; Mr. and Mrs. E. L. Patch, and Miss Esther M. Patch, of Stoneham; Claude C. Cannon, of Vineyard Haven; B. C. Burdette, of Waverley;

J. M. Good, Estelle Jenda, R. F. Jenda, and Mr. and Mrs. H. M. Whelpley, of St. Louis.

Nebraska—R. A. Lyman, of Lincoln.

New Jersey—Mr. and Mrs. G. M. Beringer, of Camden; Mr. and Mrs. Charles Holzhauer, of Newark; Mr. and Mrs. G. W. Parisen, of Perth Amboy; and B. L. Murray, of Rahway.

New York—H. L. Taylor, of Albany; Mr. and Mrs. W. C.

Now whatever can Prof. Remington and Dr. Kehler be talking about so earnestly and confidentially?

Anderson, E. H. Bartley, Mr. and Mrs. G. C. Diekman, Joseph Kahn, Otto Raubenheimer, and F. P. Tuttle, of Brooklyn; Mr. and Mrs. A. M. Roehrig, of Buffalo; W. L. DuBois and Miss Dubois, of Catskill; W. C. Alpers, Louis Berger, Emil Boehm, T. P. Cook, W. G. Cook, R. A. Hatcher, Francis B. Hays, E. J. Kennedy, Hugo Kantrowitz, J. L. Lascoff, Robert L. Lehman, Louise Lehman, Henry C. Lovis, Ewen McIntyre, Mrs. Henrietta Maibrun, Thomas F. Main, William Mansfield, C. A. Mayo, Mr. and Mrs. C. W. Parsons, Mr. and Mrs. Henry W. Schimpf, and Miss Seabury, of New York; and David Stolz, of Syracuse.

North Carolina—E. V. Howell, of Chapel Hill; Ira W. Rose, of Rocky Mount; and E. V. Zoeller, of Tarboro.

North Dakota—H. L. Haussamen, of Grafton.

Ohio—Mr. and Mrs. Frank H. Freerichs, and John Uri Lloyd, of Cincinnati; H. V. Arny, Mr. and Mrs. N. A. DuBois, Mr. and Mrs. Lewis C. Hopp, Miss Emma Hopp, and J. F. Woolsey, of Cleveland; G. B. Kauffman, of Columbus; Mr. and Mrs. C. S. Ashbrook, of Mansfield; Mrs. W. H. Whitcomb, of Oxford; and J. H. Beal, of Scio.

Oklahoma—H. D. Kniseley, of Checotah; and J. C. Burton, of Stroud.

Pennsylvania—Mr. and Mrs. George A. Gorcas, and Miss Katharine Gorcas, of Harrisburg; Mr. and Mrs. J. L. Lemberger, of Lebanon; Miss Helen R. Burns, of Lewistown; Mr. and Mrs. P. Henry Utech, of Meadville; Mr. and Mrs. John C. Wallace, of New Castle; Mr. and Mrs. F. M. Apple, E. Fullerton Cook, Mr. and Mrs. Joseph W. England, Quintus Hoch, Mr. and Mrs. C. H. LaWall, C. B. Lowe, G. H. Meeker, J. P. Remington, Dr. Solomon Cohen, I. V. S. Stanislaus, F. E. Stewart, F. P. Stroup, Maggie F. Wells, H. E. Wendel, Emma Wendel, Mary E. Wendel, and Mr. and Mrs. R. W. White, of Philadelphia; and Mr. and Mrs. Louis Emanuel, E. C. Emanuel, Ruth O. Emanuel, J. A. Koch, Mrs. C. M. McCandler, B. E. Pritchard, and Louis Saalbach, of Pittsburgh.

Rhode Island—James O'Hara, of Providence.

South Dakota—Stephen H. Scallin, of Mitchell.

Tennessee—Mr. and Mrs. J. O. Burge, Mrs. Eva D. Thackston, William R. White, and Mrs. Ida R. Williamson, of Nashville.

Texas—Mr. and Mrs. E. G. Eberle, of Dallas; R. H. Walker, and R. H. Walker, Jr., of Gonzales.

Virginia—Miss Anabel Hays, and Mr. and Mrs. T. F. Knock, of Petersburg.

Washington—C. W. Johnson, of Seattle.

Wisconsin—E. Kremers, of Madison; and G. V. Kradwell, of Racine.

Cuba—Jose P. Alacan, of Vedado.

There was a large crowd around Plymouth Rock, but somehow the camera pointed straight at Dr. and Mrs. Whelpley.

Jennie H. Summer, of West Roxbury; Mr. and Mrs. P. J. Kennier, and J. W. T. Knox, of Winthrop; and W. S. Flint, of Worcester.

Michigan—J. M. Francis, Mr. and Mrs. Harry B. Mason, Mr. and Mrs. W. L. Scoville, Miss Amy Scoville, Miss Ruth Scoville, and L. A. Seltzer, of Detroit; and Mr. and Mrs. E. J. Rodgers, of Port Huron.

Missouri—Mr. and Mrs. William Mittelbach, of Boonville; Mr. and Mrs. C. E. Zinn, of Kansas City; and L. G. Blakeslee, Mr. and Mrs. Solomon Boehm, J. A. Boehm, C. E. Caspari, Mr. and Mrs. Otto F. Clauss, Mr. and Mrs.

Conference of Pharmaceutical Faculties.

Owing to the absence on account of sickness of President J. O. Schlotterbeck, of Ann Arbor, his address to the twelfth annual meeting of the American Conference of Pharmaceutical Faculties was read by Secretary C. W. Johnson, of Seattle. The sessions were held at the Hotel Vendome, Boston, during the week of August 14th, in conjunction with the fifty-ninth annual meeting of the American Pharmaceutical Association. The address was full of recommendations of a constructive character, and the appreciation of the conference of the work of its president was shown by its re-election of him to the office in spite of his absence.

Secretary-Treasurer Johnson reported a balance in the treasury of \$576.

A paper on the teaching of pharmaceutical arithmetic was read by Prof. J. H. Beal, of Scio, Ohio, and discussed by Profs. A. B. Stevens, of Ann Arbor, and J. W. Sturmer, of Lafayette, Ind., all three of whom have published books on the subject.

Another paper, on pharmaceutical technic, was read by Prof. Edward Kremers, of Madison, Wis.

It was decided that the conference should apply for par-

J. O. SCHLOTTERBECK.
Re-elected President of the Conference.

JULIUS A. KOCH.
Chairman of the Executive Committee.

ticipation in the Carnegie foundation fund, provisionally; and it was also ordered that hereafter before a college faculty is admitted to membership in the conference, inspectors should visit the college and make a favorable report as to its status at the expense of the conference.

Prof. C. W. Johnson, of Seattle, was made a member of the national syllabus committee to succeed Prof. H. V. Arny, now of Cleveland, but soon to join the faculty of the College of Pharmacy of the City of New York, Columbia University.

The usual amount of routine work, accompanied by much discussion of a more or less technical character, was accomplished.

New officers, unanimously elected, are as follows: President, J. O. Schlotterbeck, of Ann Arbor; vice-president, A. H. Clark, of Chicago; secretary-treasurer, C. W. Johnson, of Seattle; executive committee, J. A. Koch, of Pittsburgh; W. J. Teeters, of Iowa City; E. G. Eberle, of Dallas; J. M. Good, of St. Louis; and E. H. La Pierre, of Boston.

National Association of Boards of Pharmacy.

During the week of the meeting of the American Pharmaceutical Association at Boston, August 14th to 19th, the National Association of Boards of Pharmacy held its eighth annual meeting with President E. O. Engstrom, of Pittsfield, Mass., in the chair.

The report of Secretary A. F. Sola, of Winchester, Ind., showed that thirty-three State boards held active membership in the association, and six, associate memberships.

R. H. Walker, of Gonzales, Texas, reported for the executive committee, and E. Berger, of Tampa, Fla., for the committee on new members. The latter report showed that two associate members had become active members during the year, and that five other State boards had become active members.

H. L. Haussamen, of Grafton, N. D., reported for the

committee on examinations, Chairman W. F. Root, of Brattleboro, Vt., being absent, and R. H. Walker performed a like service for the committee on publication, in the absence of its chairman, F. B. Lillie, of Guthrie, Okla.

The following officers were elected: President, R. H. Walker, of Gonzales, Texas; vice-presidents, C. H. Davis, of Bangor, Me.; H. L. Haussamen, of Grafton, N. D.; and L. C. Lewis, of Tuskegee, Ala.; secretary-treasurer, A. F. Sola, of Winchester, Ind.

John B. Bond, Sr., of Little Rock, Ark., was appointed to serve the unexpired term of R. H. Walker as a member

R. H. WALKER.
The New President of the Boards Association.

A. F. SOLA.
Re-elected Secretary-Treasurer.

of the executive committee; C. E. Zinn, of Kansas City, Mo., was elected a member of the executive committee for a full term of three years; and W. H. Rudder, of Salem, Ind., was made a member of the national syllabus committee in place of E. Berger, whose term had expired.

The Annual Joint Conference.

As usual, one session of the section on pharmaceutical education and legislation was held in conjunction with a session of the conference of faculties and a session of the association of boards. This joint meeting took place Thursday evening, and was devoted principally to a discussion of a model set of board questions which had been prepared by a committee composed of five members of the conference of faculties and a like number from the association of boards. No definite conclusion was reached.

Dr. Henry L. Taylor, of Albany, representing the department of education of the State of New York, spoke on the work of the syllabus committee, and a general discus-

Prof. Caspari, "Jr.," stands in the center, while next him is his son, Prof. Caspari, "Sr." The paradox—or pair o' docs—does—or do—not seem to bother Prof. Kremers in the least. These men are three of the pillars of the association; the other four pillars in the picture help to support Plymouth Hall.

sion followed. Those who had changes in the syllabus to suggest were requested to submit them in writing. The committee is open for criticism and suggestion at all times, and gets a good deal of both.

National Syllabus Committee.

The national syllabus committee is a body composed of twenty-one members, one-third of whom are appointed by the American Pharmaceutical Association, one-third by the American Conference of Pharmaceutical Faculties, and

one-third by the National Association of Boards of Pharmacy. Its duty is to prepare an outline of what should be taught at colleges of pharmacy, and how, and to designate the proportionate amount of time which should be devoted to each subject taught. It was formed last year (see the CIRCULAR for June, 1910, page 311), to take up and continue the work begun by a smaller committee working under the joint supervision of the New York Board of Pharmacy and the department of education of the State of New York.

The members of the committee are as set forth below:

A. Ph. A.	A. C. P. F.	N. A. B. P.
H. L. Taylor,	C. W. Johnson,	W. H. Rudder,
Albany, N. Y.	Seattle, Wash.	Salem, Ind.
W. G. Gregory	J. H. Beal,	E. O. Engstrom,
Buffalo, N. Y.	Pittsburgh, Pa.	Pittsfield, Mass.
W. B. Day,	H. H. Rusby,	S. L. Hilton,
Chicago, Ill.	New York, N. Y.	Washington, D. C.
G. M. Beringer,	J. O. Schlotterbeck,	Charles Gietner,
Camden, N. J.	Ann Arbor, Mich.	St. Louis, Mo.
H. B. Mason,	J. A. Koch,	W. E. Collins,
Detroit, Mich.	Pittsburg, Pa.	Owasso, Mich.
E. G. Eberle,	W. C. Anderson,	D. F. Jones,
Dallas, Tex.	Brooklyn, N. Y.	Watertown, S. D.
Charles Caspari, Jr.,	C. B. Lowe,	C. O. Bigelow,
Baltimore, Md.	Philadelphia, Pa.	New York, N. Y.

The terms of the three members whose names appear on the top line run for seven years from 1911, each of these members having been appointed this year for a full term. The remaining members are to serve for six, five, four, etc., years, respectively, as indicated by the relative positions of their names in the list.

Dr. A. R. L. Dohme, of Baltimore, accompanied by Mrs. Dohme and their two daughters, returned home recently from an extended automobile trip through the mountains of New York and New England.

Mrs. Godding resting on the porch of Plymouth Hall. She did not know what the camera man was doing until it was too late either to defend herself or run.

Prof. and Mrs. Anderson being from Brooklyn, look around to see what Plymouth has to offer in the way of choice building lots, but failed to find anything in the "only forty-five minutes to Broadway" zone.

The sometimes accurate *Hartford Times*, under "Science Notes," reports that a German professor has produced artificial rubber by boiling "isofrem" in acetic acid. He thus produces "a grayish composite having all the qualities of rubber." The trouble is to secure the first ingredient. "Isofrem" is a distillate of iceofrom, which is boiling water kept at 375° F. until it freezes solid. It is then cut into inch cubes, shellacked and exposed to the rays of the moon until they turn greenish-pink. It is then ready for use.—*India Rubber World*.

Adolph Pricken, who was charged with the theft of \$30,000 worth of perfumery from Park & Tilford, of this city, has been convicted and sentenced to serve four years and five months in Sing Sing prison.

Michigan has a new law which requires the use of a special characteristic stopper in all bottles containing poison. The measure becomes effective November 1st.

Physicians on the Scope of the Pharmacopœia.

Physicians are the proper ones to say what should go with the Pharmacopœia, so it is seemly that the chairman of the sub-committee on admissions and deletions

DR. SOLOMON SOLIS COHEN.

since, now being professor of the executive committee of the committee of revision of the United States Pharmacopœial Convention should be a physician. The man who fills this place is Dr. Solomon Solis Cohen, who for nearly thirty years has been teaching medicine in one or more of the many medical colleges of his native city, Philadelphia. Dr. Cohen was born September 1st, 1857, and after taking his A. B. and A. M., entered Jefferson Medical College in 1880, from which he emerged three years later with his M. D. He at once took up teaching in connection with his practice, and has been at it ever

since, now being professor of clinical medicine at his alma mater.

The Doctor is a prolific writer and a member of many societies, medical, social, poetical, literary and educational. In his writings and lectures he has always opposed therapeutic nihilism, and while he has avowed a "robust faith in the efficacy of the right drug given in the right dose at the right time," he has been a pioneer in the systemization of hygiene and non-drug treatments.

It has well been said of Dr. Cohen that he "is a man of philosophic mold, full of learning, ripe in knowledge, rich in experience, a profound thinker, an eloquent speaker, a scholarly and graceful writer, an entertaining lecturer, an admirable teacher, of sympathetic temperament, liberal in spirit and just in act."

The Davis Drug Company, Fort Smith, Ark., occupies a new modernly-equipped store, a prominent feature of which is its soda fountain—said to be one of the finest in that section of the country.

Prof. Clark scanning the scenery for a good picture for his camera. The cigar is for artistic inspiration.

Prof. LaWall and the Circular camerist, each try to "get the drop on" the other first, while Mrs. LaWall, as is usual with the innocent by-stander, is a victim.

Los Angeles County, Cal., has a new ordinance that requires druggists to report to the police officials any case of gunshot or knife wound coming to their attention, which was received otherwise than accidentally or in a surgical operation.

The New Dean at Cleveland.

To succeed Prof. H. V. Army, whose change from the deanship of the Cleveland School of Pharmacy to a professorship at the College of Pharmacy of the City of New York was reported in last month's CIRCULAR, page 439, the trustees of the Cleveland school have elected as dean Dr. Norman A. DuBois, formerly of the Case School of Applied Science.

N. A. DUBOIS, B. S., A. M., Ph. D.

The new dean of the Cleveland School of Pharmacy, Western Reserve University.

Prof. DuBois has acquired a valuable experience in the teaching of chemistry through his connection with the instructing staff of Brown University, Syracuse University, and New York University, before going to the Case school. His experience has covered all the various phases of chemical teaching including the instruction of advanced university students. This will doubtless stand him in good stead in carrying the burdens of the head of a school, and should influence the progress of his pupils.

In industrial and applied chemistry also, Dr. DuBois is said to have acquired an enviable reputation; and he is well known as a research chemist. All in all his deanship should prove an aid toward the prosperous future that the trustees considered assured to the school in its newly equipped building.

Prof. Goodman on Sick-Leave.

The trustees of the University of Illinois have granted Dean F. M. Goodman, of the Chicago College of Pharmacy (a department of the university), a year's leave of absence on half pay. Prof. Goodman has been in poor health for more than a year, having had to relinquish his duties in January, last.

Prof. W. B. Day has been appointed acting dean and will take the classes in botany and materia medica during Prof. Goodman's absence. Prof. C. M. Snow will have charge of the course in pharmacy and will have the assistance in the pharmaceutical laboratory of Henry W. Colson, Ph.C. The course in chemistry will be given by Prof. A. H. Clark. The rest of the teaching staff is the same as during the last term.

Chicago College Confers Ph. C. Degrees.

The course at the Chicago College of Pharmacy for the degree of pharmaceutical chemist was this year completed by the following:

S. C. Annenberg, of Aurora; H. W. Colson, of Chicago; C. LeR. Foote, of Elgin; R. H. Lower, of Cairo; and J. B. Carpenter, of Grand Junction, Col.

Picnics.

Two carloads of Grand Rapids (Mich.) druggists, their families and friends, were entertained by their Muskegon brethren August 3d. A number of athletic events were held, and there was also general entertainment.

Some 300 persons were present at the picnic of the Milwaukee Pharmaceutical Association, July 27th. All sorts of games were indulged in, with a base-ball game as the pièce de resistance.

'Twas a howling success, that picnic of the Chicago Social Drug Club at Cedar Lake August 17th, with a real base-ball game, a regular Olympic athletic meet, and dancing—to say nothing of the feasting.

A base-ball match was the big feature of the outing of the Ohio Valley Druggists' Association held July 27th. A fine time was the total result.

Dr. Oldberg Gets New Degree.

At the 1911 commencement exercises of Northwestern University, at Evanston, Ill., the honorary degree of doctor of laws was conferred upon Dr. Oscar Oldberg. The Doctor had but recently resigned as dean of the department of pharmacy because of ill health.

Obituaries.

The following are the recently reported deaths of persons in the drug world:

ERASTUS C. BILLINGS, at Syracuse, N. Y., July 24th, aged seventy-two years.

CHARLES H. CARLTON, of Wilmerding, Pa., August 18th, aged seventy-three years.

FREDERICK THOMAS COOK, of Waterbury, Conn., August 19th, aged forty-five years.

S. S. CRISSMAN, of Johnstown, Pa., August 12th, aged sixty-four years.

AMOS S. FISHER, of Bergen, N. Y., August 13th, aged eighty-two years.

Dr. HERMAN GLUCKMAN, of Brooklyn, N. Y., at White Lake, August 8th.

HENRY N. HUNTINGTON, of Washington, Pa., at Franklin, August 14th, aged forty-eight years.

ALFRED P. KNIGHT, of Chicago, Ill.

LUTHER MACINNIS, of New Castle, Pa., July 24th, aged eighty-two years.

DARWIN W. MEAD, at Oswego, N. Y., August 1st, aged fifty-five years.

JOSEPH B. OVER, of Memphis, Tenn., August 11th, aged thirty-seven years.

GEORGE L. PIERCE, of Jamaica Plain, Mass., at Lowell, August 16th, aged thirty-four years.

WILLIAM READING, of Norton, Pa., July 23d, aged fifty-five years.

ROY C. ROBERTSON, at Clayton, N. C., July 14th, aged twenty-five years.

OZEN SACKETT, of New Albany, Ind., July 31st, aged seventy years.

STEINER SCHLEY, of Frederick, Md., August 16th, aged sixty-two years.

LEROY SHACKEFORD, of Trenton, Tenn., July 22d.

JAMES THADDEUS SHUPTRINE, of Savannah, Ga., August 15th, aged sixty-one years.

JOHN STRUMPF, of Gretna, La., July 28th, aged fifty-four years.

FERDINAND THIEMAN, of Chicago, Ill., July 22d, aged fifty-two years.

JOHN L. THOMPSON, of Cambridge, Mass., July 24th, aged forty-one years.

GUNDER TUFT, of Minneapolis, Minn., July 25th, aged thirty-four years.

REUBEN WALTER, of Philadelphia, Pa., August 7th.

C. A. WATSON, at Homer, N. Y., July 20th, aged seventy years.

Dr. T. D. WILLIAMS, of Jersey City, N. J., August 4th, aged fifty-five years.

WILLIAM WILSON, of Amsterdam, N. Y., July 24th, aged sixty-seven years.

EDWARD C. ZAHRT, of La Porte, Ind., July 22d.

Characteristics of Some Drugs in New Hampshire.

From the July issue of the *Sanitary Bulletin* published by the New Hampshire Board of Health is compiled the following information relative to some drug products investigated by the board:

Calcium hypochlorite.—"Acme," A. Mendelson's Sons, of New York, N. Y., two samples: "100 per cent. and 81 per cent. of the required amount of available chlorine." "Black Diamond," Archibald & Lewis, of New York, N. Y., two samples: "71 per cent. and 22 per cent., respectively, of the required amount of available chlorine."

Camphor liniment.—M. J. Lowe, of Lancaster: "8.9 per cent. of camphor." W. O. Emerson & Co., of Groveton: "8.5 per cent. of camphor." Arthur Chemical Company, of New Haven, Conn.: "5.82 per cent. of camphor." Several samples contained petroleum oil.

Fluidextract of ginger.—None of three samples collected was of standard strength.

Spirit of anise.—Allen Drug Company, of Hanover: "46 per cent. of the required amount of oil."

Spirit of camphor.—D. J. Buckley, of Dover: "56 per cent. of the required amount of camphor."

Spirit of peppermint.—W. H. Brown, of Pittsfield: "76 per cent. of the required strength." G. H. Colbath, of Pittsfield: "54 per cent. of the required strength." W. J. Lowe, of Lancaster: "60 per cent. of the required strength." D. C. Woodman, of Whitefield: "48 per cent. of the required strength." Blue Seal Extract Company, of Littleton: "16 per cent. of the required strength." Griffin's (Merrimac Chemical Company, of Franklin Falls): "22 per cent. of the required strength."

Tincture of iodine.—G. H. Colbath, of Pittsfield: "81 per cent. of the amount of iodine required." W. H. Brown, of Pittsfield: "41 per cent. of the amount of iodine required." D. C. Woodman, of Whitefield: "82 per cent. of the amount of iodine required." D. J. Buckley, of Dover: "70 per cent. of the amount of iodine required."

Atwood's Vegetable Jaundice Bitters.—Manhattan Medicine Company, of New York, N. Y.: "Contains 14.40 per cent. alcohol and about 20 per cent. solids, the latter consisting of licorice and probably gentian, rhubarb, and other herb bitters. No quinine."

Chloräthyl and Antidolorin.—"Two specimens of ethyl chloride, as used in dental surgery, were forwarded from Nashua. One of these was an imported product, known as Chloräthyl, Dr. Speier, distributed by Maurice Rosenblum, Boston, Mass., the other being manufactured by the Franco-American Chemical Works, Woodridge, N. J., and sold under the names of 'Antidolorin' ('Ethyl chloride of guaranteed purity'). The analytical results follow:

	Chloräthyl	Antidolorin
Specific gravity at 8°C..	0.910	0.910
Boiling point.....	13-14°C	13-14°C.
Alcohol	none	none
Free chlorides (mineral)	none	none
Sulphur compounds.....	none	present
Other bodies.....	none found	none found

"The above indicates that both samples consist of unmixed ethyl chloride, but the antidolorin has not been sufficiently purified from sulphur compounds, the amount present being sufficient to render the administration of this preparation by inhalation objectionable. Notwithstanding this fact, the antidolorin was said to be 'much the more expensive of the two.'"

Hakka Cream.—Hakka Chemical Company, of Boston, Mass.: "Consists essentially of menthol and boric acid in a vehicle of petrolatum; no cocaine. Notwithstanding its relatively high cost, the preparation is a very poorly made one, an examination of two tubes representing different lots indicating that practically all of the boric acid lay at the cap in both cases. Boric acid is not soluble in petrolatum."

Dr. Miles' Restorative Nervine.—Dr. Miles' Medical Company, of Elkhart, Ind.: "No alcohol was found in this preparation. The solids amount to about 60 per cent., including the glycerin used as a solvent. Cane sugar is present to the extent of 33.65 per cent., together with a large amount of invert sugar, undetermined. The residue upon incineration amounts to 11.48 per cent., practically the whole of which consists of bromides, upon which the me-

dicinal action of the preparation is doubtless chiefly founded, as the organic constituents seem to consist mainly of sugar, glycerin and aromatics. No antipyrine, no alkaloids."

Orrine (cure for the liquor habit).—Orrine Company, Incorporated, of Washington, D. C.: "Price \$1 per box of twelve powders. The latter were found to be exceedingly irregular as to weight, varying from less than five grains to ten grains, indicating careless preparation. The analysis indicates about 16 per cent. of ammonium chloride and 0.54 per cent. of gold chloride, mixed in a vehicle consisting of milk sugar. As for the gold, which is present in less than the minimum dose (amounting in these powders to 1/40 to 1/20 grain) [U. S. P. average dose is 1/20 grain], the National Dispensary states: 'It is said to be a preparation used by quacks in the treatment of the alcohol habit, but it has no specific action upon this condition, and the tonics and stimulants given with it, combined with a good regimen, are probably of much more value.' The usual 'symptom blank' accompanies the package, and the literature has other 'ear marks' which serve for the proper classification of this nostrum. While the company guarantees to 'effect a cure or money refunded,' it appears that the terms of this guaranty are such that there is abundant likelihood that the average unfortunate would fail at some point to give the minute compliance required by the conditions imposed."

Sophistication in Massachusetts.

In the June number of the *Monthly Bulletin* of the Massachusetts Board of Health the board reported as follows concerning a number of samples of drugs which it had investigated during the month of June:

Camphor liniment.—A. W. Cunningham, of Springfield: "43.6 per cent. U. S. P. strength; low in camphor."

Extract of lemons.—Simpson Brothers Company, no address: "No lemon oil present."

Spirit of peppermint.—Charles Clarke & Son, of Lawrence: "61 per cent. U. S. P. strength; low in peppermint oil." Walter L. Conwell, of Boston: "29.5 per cent. U. S. P. strength; low in peppermint oil." Levasseur's Pharmacy, of Worcester: "78 per cent. U. S. P. strength; low in peppermint oil." Packard's Pharmacy of East Boston: "84.2 per cent. U. S. P. strength; low in peppermint oil." Ropes Drug Company, of Lynn: "84.2 per cent. U. S. P. strength; low in peppermint oil."

Tincture of iodine.—Bay State Drug Company, of Palm-er: "85 per cent. U. S. P. strength; low in iodine."

"Vino sangre, medicinal wine".—S. S. Pierce Company, of Boston: "Contained 19.28 per cent. alcohol by volume."

Laws Against Dope, Indecency and Other Things.

Progress is reported by the Thompson Drug Company, Spring Valley, Ill., in its efforts to secure copies of laws and ordinances against (1) the indiscriminate distribution of medicine samples, (2) the sale of morphine-laden soothing syrups, and (3) the advertising of remedies for diseases of women and venereal troubles. A request for data on these subjects from this company was printed in the CIRCULAR for July, page 371. Some were given therein, but the company wants more, and requests a druggist in each State and town in which there is such a law or ordinance to write it to that effect.

Now, druggists, here is an opportunity to manifest the fraternal spirit which you are known to possess. Get busy.

Himalya and McLean's Tar Wine Lung Balsam.

"Nature's great specific for the cure of asthma"—\$2 per bottle—otherwise known as himalaya, has been analyzed by the North Dakota authorities. In the "Special Bulletin, Food Department," for June, issued by Commissioner E. F. Ladd's department, Chemist Putt says:

This preparation appears to be a weak hydrochloric solution of potassium iodide flavored with peppermint and licorice, and colored with caramel. The label would indicate that the activity of the preparation is due, in part, to kola. Since caffeine was not detected in the course of the analysis and that drug is a constituent of true kola nuts, the logical conclusion is that little, if any, kola enters into the preparation.

Attention is called to the statement on the label that when the remedy is taken (already containing over 9 per cent. alcohol),

"it is better to use whisky as the alcohol aids in developing the action of the himalya." One might be curious to know just how much of this beneficial action is then due to the remedy and how much to the whiskey in which it is taken.

In the same bulletin Prof. Putt reports the result of his analysis of McLean's tar wine lung balsam, and adds this comment:

The analysis would indicate that this preparation is nothing but a weak syrup of tar containing about 15 per cent. by volume of ethyl alcohol.

The absence of tartrates, wine acids, and the presence of only a trace of phosphates clearly shows that the base of the preparation is not wine, as the label would lead one to believe.

Sugar and alcohol are present in about the same proportion as in an ordinary sweet wine, such as port.

In discussing the medicinal properties of tar, the United States Dispensatory (nineteenth edition), says: "Little benefit can be expected from it in genuine phthisis" [tuberculosis]. Thus the remedial agents contained in this preparation, which "will cure consumption," etc., are sugar and alcohol.

Both preparations were found not to be labeled in compliance with the laws of North Dakota.

Anti-Narcotic Doings.

According to a newspaper statement credited to Christopher Koch, of Philadelphia, vice-president of the Pennsylvania Board of Pharmacy, illicit trafficking in cocaine has been revived in the Quaker City to an alarming extent, since the cessation of the board's activity against dope-sellers. Supplies of the drug, Mr. Koch said, are sent in to agents, nominally wholesale druggists, by manufacturers in New York and Detroit. The drug is peddled on the street for the most part and supplied by a few druggists in the "tenderloin."

A conference of the local member of the board with the board's attorney has been held and prosecutions have been planned. The board is handicapped by a lack of funds, and practically prevented from killing the traffic by the lack of restrictions upon the interstate shipment of narcotics.

The Louisiana Board of Health has declared its intention of enforcing rigidly its ruling restricting the refilling of prescriptions for opiates and other narcotics.

R. P. Sims, of Spokane, Wash., recently plead guilty to a charge of refilling a prescription for cocaine contrary to the provisions of law. He was sentenced to pay a fine of \$25 and costs.

Ah Chew, of Portland, Ore., received the maximum penalty for illegally selling narcotics, in an action tried August 1st. He was sentenced to pay a fine of \$200 and to undergo an imprisonment of ninety days, at labor. Two other Chinese and two whites, one of the latter a druggist, are serving sentences for similar offences.

The California supreme court has declared the validity of the statute which makes it illegal for any person to have in his possession "any cocaine, opium, morphine, or any preparation thereof containing more than two grains to the fluid ounce, except upon the written order or prescription of a physician, dentist or veterinary surgeon licensed to practice in this State, or unless such possession is that of a jobber, wholesaler, manufacturer to pharmacies, retail pharmacy, physician, dentist or surgeon licensed to practice in the State."

Old Doc Wiley.*

By WALT MASON.

You can't speak too highly of good old Doc Wiley, the government chemist, our bulwark and hope, protecting our bellies from ketchups and jellies and all sorts of things which are loaded with dope. He's death to the faker; he chases the maker of fraudulent remedies, labeled with lies; he seizes the butter too rancid to utter, and puts the kibosh on the poisonous pies. Doc Wiley has throttled the sinners who bottled all sorts of cheap rubbish and labeled it jam; courageously, gaily, he's guarding us daily from dishonest sauerkraut and vitrified ham. It's true they are saying he's too fond of playing in front of the grand stand and beating the drum; but one who is doing the work he's pursuing would hurt and annoy us if he should be dumb. When news to us trickles that codfish or pickles were seized by Doc Wiley because they were punk, we list to his holler and bet half a dollar he'll clean up the fakers who dealt in such junk. So here's to Doc Wiley! They treated us vilely, by feeding us poison and gumbo and glue; they'd no ruth or pity till Doc, wise and gritty, jumped onto their persons and made them come through!

* Copyright, 1911, by George Matthew Adams.

Chemists Wanted in Federal Service.

An examination is announced for September 6th by the civil service commission, for the purpose of securing eligibles for the position of *assistant physical chemist* in the bureau of mines, at a salary of from \$1,500 to \$1,800 a year. Men only are eligible; and they must be between the ages of twenty and thirty-six years. The examination will embrace the subjects of general chemistry, physics, physical (metallurgical) chemistry, and translation from technical French, German or Spanish. Each candidate must submit a thesis on original investigation in physical chemistry. Applicants must have had an education and training equivalent to the degree of bachelor of science and four years' laboratory work.

September 16th, the commission will hold an examination for *assistant chemist* in sugar-planting investigations at a salary of from \$1,600 to \$1,800 a year. This examination will be open to men only, between the ages of twenty-five and forty years, who have an educational training equivalent to the degree of bachelor of science. The subjects in the examination will be general education and training, special education and training in analytical and organic chemistry, practical experience in laboratory work, mechanical knowledge, and training and experience in plant breeding. Each applicant must submit a thesis on original investigation in the utilization of chemistry of sugar plants.

An examination will be held September 20th to secure a *physical chemist* for the bureau of mines, at a salary of from \$2,400 to \$3,000 a year. This examination will be open to men only, between the ages of twenty-five and forty-one years, who have an education and training equivalent to the degree of bachelor of science, and five years' laboratory experience. It is desired to secure a man who is thoroughly trained in chemistry, physics, and metallurgy, and is able to read technical French, German or Spanish. Ratings will be made on education, training, experience, fitness, and contributions to the literature of the afore-mentioned subjects.

On the same date the commission will examine applicants for vacancies in the position of *junior laboratory helper* in the bureau of standards. The entrance salaries range from \$480 to \$540 a year, the position eventually paying \$900 a year. Able-bodied young men between the ages of sixteen and twenty-five years are eligible for these positions. They must pass an examination in spelling, arithmetic, letter-writing, copying, and penmanship.

Eligibles for a position as *metallurgical chemist* in the bureau of mines will be sought at an examination to be held September 23d. This position pays \$3,000 a year, and is open to men only between the ages of twenty-five and forty-six years, who are qualified in modern methods of sampling, analyzing, and assaying metalliferous ores and metallurgical products. Technical education equivalent to graduation by a school of mines is desired of the applicants; and they will be rated on education, training, experience, fitness, and contributions to the literature of metallurgical chemistry.

Full particulars of any examination may be obtained at the offices of the commission.

Price-Protection Upheld.

By a decision handed down recently by the supreme court of the State of Washington, at the petition of the Crescent Manufacturing Company, of Seattle, the Northwest Grocery Company, is restrained from "advertising or in any way whatsoever, offering for sale or otherwise disposing of any of the Crescent Manufacturing Company's trade-marked products from whatever source, now or hereafter, to be obtained for any price and terms other than or different than the contract, stipulated and advertised price thereof."

The order, which was dated May 24th, enumerated the set prices of the products involved and is a permanent restraint.

A special despatch to the New York *Sun* reports that a bill providing for the nationalizing of all drug stores in Russia will come before the дума in October. It is contended that the poor will be able thus to get better and cheaper drugs.

C. R. McCulloch, of Fremont, Ohio, retired August 8th, at the end of seventy years spent in the retail business in that city. Mr. McCulloch is eighty-six years old.

American Medical Association Meeting.

Many things of interest to pharmacists occurred in the course of this year's meeting of the American Medical Association which was held at Los Angeles, Cal., in June. One of these things was the adoption of a resolution in which the section on pharmacology and therapeutics called upon the house of delegates to instruct the council on health and public instruction to "draft amendments to the patent and trade-mark laws whereby no patents shall be granted on materia medica products, and the patents shall be limited to process and apparatus for manufacture, leaving the products themselves and the currently used names of the same free to science and commerce."

This same section, considering a communication from the American Pharmaceutical Association, approved, among others, the suggestions that the A. M. A. undertake an educational propaganda in behalf of official medicinal agents; and that a committee of the section study a plan of advanced education for pharmacists, it being the opinion that such education should embrace ethical instruction as well as professional. Relative to the sale of nostrums the section made the following utterance:

The section approves the efforts to eliminate the sale of nostrums by pharmacists and others. The amendment suggested in relation to the food and drugs act, making it a punishable crime to lie in advertising, would, if adopted, and put into operation, do much to control and limit the sale of this class of products.

Concerning substitution in one of its less obnoxious forms, the section expressed itself as follows:

The section does not approve of the substitution of one product for another, or one brand for another, without the knowledge and consent of the prescriber. Circumstances may sometimes arise when it is impossible to obtain consent beforehand. Under such circumstances the substitution of brands may be permissible but not the substitution of products. In such cases the prescriber should always be notified afterward and subsequent renewal of prescription be guided by the wishes of the prescriber.

One of the most momentous questions, from a pharmaceutical viewpoint, with which the section on pharmacology and therapeutics concerned itself was that of dispensing by physicians. There is much that is hopeful for pharmacists in the following utterance in which the section expressed its opinion on the subject:

The proper selection, preservation, preparation, compounding and dispensing of medicine requires proper education and training not included in the courses of instruction given in medical schools, but comprised in the courses furnished by schools of pharmacy. Physicians who have not duly qualified as pharmacists are not trained to undertake the work of the pharmacist. However, as stated in the recommendation of the delegation, there are conditions existing which require physicians to dispense their own medicine. The section, therefore, recommends that physicians shall, as far as possible, relegate to pharmacists the dispensing and limit themselves to the prescribing of medicines; also that pharmacists place themselves in position to act in co-operation with the medical profession by refraining from counter-prescribing, and recommending medicines for self-medication whether prepared by themselves or others.

The officers elected by the section on pharmacology and therapeutics are: Chairman, Torald Sollman, of Cleveland, Ohio; vice-chairman, R. L. Wilbur, of San Francisco; and secretary, M. I. Wilbert, of Washington, D. C.

The association elected the following general officers: President, Abraham Jacobi, of New York; vice-presidents, W. J. Barlow, of Los Angeles, Cal.; F. W. McRae, of Atlanta, Ga.; W. R. Tipton, of Las Vegas, N. M.; and A. L. Wright, of Carroll, Iowa; secretary, A. R. Craig, of Chicago; and treasurer, W. A. Pusey, of Chicago. Dr. G. H. Simmons, of Chicago, remains as editor and manager of the *Journal*.

Society of Chemical Industry.

At the thirtieth annual meeting of the Society of Chemical Industry, held at Sheffield, Eng., July 12th, the following officers were elected: President, Rudolph Messel, of London; vice-presidents, W. F. Reid, Henry Hemingway, and Sir William Crookes, all of England; and G. G. Henderson, of Scotland; honorable treasurer, Thomas Tyrer; and honorable foreign secretary, Dr. J. I. Lewkowitzsch.

An association has been formed by the manufacturers of store fixtures and furniture with the name, National Commercial Fixture Manufacturers' Association. About thirty firms are members. The association has an office at Grand Rapids, Mich.

British Pharmaceutical Conference.

Portsmouth, its officials and its pharmacists outdid themselves to play the host to the British Pharmaceutical Conference on the occasion of its forty-eighth annual meeting, held at that city July 25th to 27th. The meeting, as a result was socially a success; professionally and practically considered it was noteworthy. Twenty-seven organizations were represented by delegates.

President W. F. Wells in his annual address considered at length the legislative aspect of British pharmacy. His historical synopsis was very interesting. His conclusions were not very hopeful, although he disclaimed any pessimistic tendency. But he called upon each to do the little he could, courageously and hopefully to labor for better things.

W. F. WELLS.
The Retiring President.

SIR EDWARD EVANS.
The New President.

In the report of the executive committee there was embodied a series of recommendations formulated by a joint meeting of representatives of the conference and the British Medical Association. These had to do with a desire to retain the existence of pharmacy and to secure adequate recognition in the case of the enactment of the national insurance bill. The recommendations and particularly the matter which gave rise to them were discussed at some length, the conference finally concurring in the recommendations of the executive committee.

Treasurer J. C. Umney reported that the deficit in the finances of the conference had been reduced to £25.

Many important and interesting papers were presented; abstracts of some of them follow:

THE COMPOSITION OF DIABETIC FOODS.

Twelve different samples of gluten bread and flour, the product of seven manufacturers, were examined and reported upon by F. W. F. Armand, who concluded that the products of one manufacturer alone might be said to be satisfactory. A sample of an expensive diabetic food was found to consist of ordinary flour which had merely been heated. The author thought it expedient that some steps should be taken for the repression of the business carried on in the sale of ordinary bread and flour as especially recommended diabetic foodstuffs; otherwise the composition of these foodstuffs should be declared to the purchaser.

A SUGGESTED STANDARD FOR THYROIDEUM SICCCUM.

The agreement among the majority of pharmacologists that the activity of thyroid is directly proportional to and dependent upon the combined iodine present, said R. R. Bennett, appears to render it urgently desirable that an iodine standard should be fixed, especially in view of the wide variations in the iodine content of commercial samples of thyroideum sicccum. He had examined specimens of thyroideum sicccum from four of the leading manufacturers recently and he found the combined iodine present to vary in amount from 0.315 per cent. to 0.038 per cent. The author had also determined the percentage of iodine in dry thyroid prepared from sheep's thyroids obtained direct from the slaughter house, the glands having been treated in accordance with the directions of the British Pharmacopœia. The iodine present in the resulting powders varied from 0.21 per cent. to 0.096 per cent., the average value being 0.158 per cent. These and the figures of American investigators were taken to indicate that an

iodine standard of 0.15 per cent. might be adopted for *thyroideum siccum*.

EXTRACT OF INDIAN HEMP.

Harold Deane gave the results of the examination of a large number of samples of extract of indian hemp which showed that they varied to a remarkable extent. He suggested that the pharmacopœial process of manufacture should be altered and that some limit of the content of insoluble matter and water should be fixed officially. To produce a satisfactory extract, he suggested simply to wash the brown extractive with warm water, after the spirit has been distilled off, in the same way as resin of jalap and resin of scammony are prepared.

A FURTHER NOTE ON PODOPHYLLUM EMODI.

J. C. Umney stated that his investigations had convinced him that it is because of natural variations in the resin, probably at different seasons, that varying results have been obtained. He gave the results of an examination of podophyllum supplied to him from the Indian Museum by the indigenous drugs committee, and concluded that the rhizome collected after flowering is much richer in podophyllotoxin and of greater activity than that which he had previously examined, and is about twice as strong as the American variety.

THE SUPPOSED LOSS OF MORPHINE IN THE PREPARATION OF TINCTURE OF OPIUM.

The results of experiments reported by E. H. Farr and R. Wright went to prove that if the B. P. official methods are followed throughout there is always a slight loss of morphine. In seven samples of opium worked upon the loss varied between the limits of 0.8 per cent. and 9.0 per cent. of the whole, with an average for the series of 4.78 per cent. In the light of these results the authors believed that there is still room for a thorough and systematic review of the whole subject. If the principle of the process had been radically unsound the deficiency of morphine would logically have been more constant and regular than was the case. The loss appeared to the authors to be due more probably to occlusion of the alkaloid, rendering its complete extraction by water or alcohol a matter of practical impossibility, or to some other factor or factors which have hitherto escaped recognition.

AN EXPERIMENT IN PEPPERMINT CULTURE.

The idea of growing peppermint in the shade occurred to H. J. Henderson upon hearing that Mr. Burnett in 1816 first distilled peppermint oil in Wayne county from plants which he found and gathered on the banks of a little stream. The piece of ground which Mr. Henderson selected for his experiment was on the bank of a stream. The plants flourished but the lack of sunlight due to the shadow cast by trees on the opposite bank prevented the production of the hairs bearing the oil cells and reacted powerfully on the yield of oil, this being only 0.1 per cent. from the fresh herb, but the odor was very good. The yield of oil from the ordinary plants grown on the farm was 0.409 per cent. in the fresh herb, cut when in flower.

The other papers were: "Note on Spirit of Sal Volatile," by E. W. Pollard; "The Education of the Pharmacist from the Point of View of the Teacher," by F. Beddow; "Linimentum Ammoniae," by J. H. Alcock; "The Moisture and Ash Content of Medicinal Extracts," by K. C. Allen and Theodore Brewis; "Note on Arsenates of Strychnine," "Note on Strychnine Hypophosphite" and "Note on Spirit of Nitrous Ether," by D. B. Dott; "Note on Solution of Sodium Ethylate," by H. Finnmere; "Note on Bartsia Odontites," by H. Finnmere and G. E. Town; "Note on the Constitution of Commercial Bismuth Subchloride," by J. B. P. Harrison; and "White Precipitate and the Analysis of White Precipitate Ointment," by G. D. Elsdon.

SECRET AND PROPRIETARY MEDICINES.

The newly established practice session concerned itself for the most part with a discussion of ways of bringing about better conditions with regard to the sale and use of ready-made medicines. E. F. Harrison read an able paper stating that of the many suggestions for the legislative remedying of existing conditions the one which had found most favor with medical men and seemed likely to be put forward as representing their official demand, is that the law should make it compulsory for all medicines advertised or sold for the cure of disease, when not supplied on a medical prescription, to bear on the label a full statement of their exact composition; and that the label

should have the force of a warranty, with penalties for misstatements. Proprietary medicines would then be in the same position as other medicines and foods under the sale-of-food-and-drugs act, and the purchaser would be protected as he should be. Mr. Harrison was of the opinion that it would be sufficient to require the declaration on the label of the principal ingredients and those included in the poison schedule or having strong therapeutic action.

Such a requirement, he continued, would do much to put an end to the fraudulent nostrums, which owe their existence only to the fact that the public is kept ignorant of their real worthlessness. He offered a resolution favoring an investigation by a royal commission or similar body with a view to the correction of the nostrum evil by legislation. This resolution was passed.

Following an established custom the conference presented to the library of the local pharmacal organization a number of books, included in which were Remington's Pharmacy and the United States Dispensary.

The following are the officers elected for the ensuing year: President, Sir Edward Evans; vice-presidents, C. B. Allen, J. P. Gilmour, Sir William Baxter, H. G. Greenish, Edmund White, and J. L. Ewing; treasurer, J. C. Umney; general secretaries, E. S. Peck and H. Finnmere; local secretary, Thomas Stephenson; executive committee, F. W. Branson, E. F. Harrison, H. W. Gadd, D. L. Howard, F. W. Gamble, R. R. Bennett, C. A. Hill, Peter Boa, and J. R. Hill; auditors, I. Bourdas and R. A. Robinson.

The 1912 meeting will be held at Edinburgh, Scotland.

The Wiley-Wilson-Wickersham Muddle Investigated by Congress.

Transferred to the halls of congress as a special matter of business, the investigation of the affairs of the federal bureau of chemistry was continued at hearings before the house committee on expenditures in the department of agriculture until August 23d. Secretary Wilson, Chief Wiley, Solicitor McCabe, Dr. Rusby, Dr. Kehler, Dr. Dunlap and Dr. Bigelow were among those called upon to testify, and the revelations were, to say the least, astonishing.

Dr. Wiley's testimony was a recital of the hampering by red tape and by juggled reports of the work of the bureau in the enforcement of the food and drugs act. He declared that the board of food and drug inspection overrode the findings of the bureau and that the other two members often out-voted him in formulating rulings.

It transpired that the so-called "Rusby letter" upon which the action of the personnel board was nominally based was a draft of a letter never sent to Dr. Wiley and had been garbled in the report so as to point toward a disregard of the wishes of the secretary of agriculture.

Secretary Wilson was not a fruitful source of information to the committee. He said that much of the friction alleged to exist in the bureau of chemistry was unknown to him, and that, because Dr. Wiley was loath to consult with him in moot questions, the Doctor often believed he had been discriminated against when the department had made a ruling. The secretary characterized much of Dr. Wiley's complaint as due to an excessive sensitiveness.

Aside from the clash over the use of sodium benzoate, it came out that there were a number of cases in which there was a division in the board of inspection, chief among them being the question of calling glucose "corn syrup." In this case, Dr. Wiley testified, the recommendations of the chemical investigators was entirely disregarded in the promulgation of the ruling favoring the glucose makers.

The case is now up to President Tatt. What the disposition will be is entirely a matter of conjecture. At the most, it is not expected that the president will render any decision until late in the fall.

Chicago Association.

General discussions were the order at the quarterly meeting of the Chicago Retail Druggists' Association in July. The proposed anti-medicine-peddler ordinance was the subject of considerable comment. It was evident from the remarks of those present that the retailing of drugs by jobbers was practically a thing of the past.

New rules to apply in nomination were considered necessary and are being formulated.

The association decided to become affiliated with the Illinois Health, Sanitation and Improvement League.

News of the State Associations.

Massachusetts Association.

At the thirtieth annual meeting of the Massachusetts Pharmaceutical Association held at Hull, in June, the following officers were elected: President, W. S. Doane, of Worcester; vice-presidents, W. M. Curtis, of Roxbury; F. J. Campbell, of Lowell; and J. J. Harper, of Great Barrington; secretary, J. F. Guerin, of Worcester; and treasurer, T. P. Nichols, of Salem.

New Hampshire Association.

At the thirty-eighth annual meeting of the New Hampshire Pharmaceutical Association held June 27th and 28th, at The Weirs, the following officers were elected: President, C. G. Shedd, of Keene; secretary, E. M. Allen, of Canaan; and treasurer, S. H. Bell, of Derry.

North Dakota Association.

Enthusiastically endorsing many suggestions looking toward a better day in pharmacy, the North Dakota Pharmaceutical Association celebrated its silver jubilee at Grand Forks, August 1st to 3d.

In his annual address, President A. H. Bell, of Devil's Lake, urged the members not to be discouraged because the farmers had blocked the druggists' efforts to stop the sale of medicines by peddlers, but to strive harder until the opposition became enlightened in the evil of peddled medicine. The president called upon the members to take an interest in legislative matters and in the work of the medical societies. He also warned them against engaging in counter-prescribing; spoke against the proposed medicine stamp-tax; and called for a hard-working committee on membership.

In all these recommendations the convention concurred.

Secretary and Treasurer W. S. Parker, of Lisbon, reported that the association had 535 members, and that its financial condition was gratifying. Mr. Parker also made the report for the board of pharmacy of which he is secretary.

Considerable attention was bestowed upon the fact that there are in the State a number of illegal liquor-sellers who decorate their shops with a few dummy shelf-bottles and call themselves druggists. The convention asked the public press not to misrepresent the drug trade by calling these persons druggists in reporting instances of their apprehension by officers of the law.

Prof. E. F. Ladd, State food and dairy commissioner, was the speaker of the year. His address was well received and his sentiments quite generally endorsed. Prof. Ladd first told of the efforts to advance the educational standards of pharmacy in the State; and then he scored the quack nostrum traffic. Seventy-five per cent. of the nostrums, he said, could well be dispensed with. He pointed out the fact that erroneous statements as to curative properties were prohibited by the State food and drugs act; and he promised to keep up the work against the use of wood alcohol in medicinal preparations. The speaker also expressed a strong sentiment against misleading and untruthful advertising.

Walter Masters, of Willow City, was nominated to the governor for reappointment as his own successor on the board of pharmacy.

W. S. Parker, of Lisbon, was named as delegate to the Boston meeting of the American Pharmaceutical Association; and H. L. Haussamen, of Grafton, was selected to represent the association at the meeting of the National Association of Boards of Pharmacy.

The association elected the following officers: President, N. R. Strehlow, of Casselton; vice-presidents, A. C. Sigurdson, of Valley City; and Sidney Creaser, of Williston; secretary and treasurer, W. S. Parker, of Lisbon; executive committee, Harry Iverson, of Egeland; A. M. Reite, of Portal; and Lee Darling, of Ambrose.

The next meeting will be held at Fargo, August 7th to 9th.

Oregon Association.

The Breakers, in the State of Washington, was the scene of the very successful twenty-second annual meeting of the Oregon Pharmaceutical Association held July 12th to 14th. By the reports of officers and committees and by the interest displayed at the sittings the progressiveness of the organization was clearly indicated.

President Fabian Byerly, in addressing his fellow-members, advised them to take an interest in politics. He also recommended affiliation with the National Association of Retail Druggists, a protest against the stamp-taxing of medicines and the parcels post, and the commendation of manufacturers who endeavor to have the prices of their wares maintained. These recommendations were all concurred in with the exception of that relative to joining with the N. A. R. D.

Several representatives of co-operative inter-insurance concerns addressed the meeting. The convention requested liability insurance concerns to furnish it with understandable particulars of their plans.

A new constitution and by-laws were adopted.

Ten new members and thirteen life members were added to the rolls.

The following were nominated to the governor for his consideration in filling the next vacancy on the board of pharmacy: F. C. Pozzi (the member whose term expires), A. W. Allen, B. F. Jones, and Ralph Crysler, all of Portland; and D. O. Woodworth, of Albany.

Contributions amounting to \$12 were collected for the Hallberg memorial fund.

The following papers were presented: "The Ethical-Practical Druggist," by F. C. Pozzi (first prize); "Pharmacy: Its Failure, Its Misapplication, Its Chances," by Joseph Riden (second prize); "What Penalty Shall Be Meted Out for Selling Cocaine Illegally," by J. M. A. Laue (third prize); "Sunday Closing," by A. W. Allen; "Does Co-operation Pay the Retail Druggist?" by G. N. Cherrington; and "Olive Oil," by W. F. Woodward.

After considering the subject of illegal cocaine selling the convention endorsed the tenor of Mr. Laue's paper and advised that the paper be printed in newspapers; it further favored the revocation of the license of convicted cocaine sellers.

New officers were elected as follows: President, H. M. Horton, of Burns; vice-presidents, F. H. Caldwell, of Ontario; T. F. Laurin, of Astoria; and W. A. Gradon, of Portland; secretary, A. W. Allen, of Portland; and treasurer, B. F. Jones, of Portland.

Utah Association Incorporated.

The Utah Pharmaceutical Association has recently been incorporated "to unite reputable druggists of the State, to encourage scientific research, and to develop pharmaceutical talent." The incorporators are: President, John Cully, of Ogden; vice-presidents, R. H. McAllister, of Logan; and A. Headquist, of Provo; secretary, Charles Van Dyke, of Salt Lake; treasurer, H. M. Peterson, of Richfield; directors, J. L. Franken, W. L. Eddy, A. R. McIntyre, J. L. Boyden, L. M. Brown, and A. L. Sutton.

Washington Association.

Some stormy sittings marked the twenty-second annual meeting of the Washington Pharmaceutical Association which was held at Seattle, July 19th to 21st. The passages-at-arms were concerned chiefly with the affairs of the State board of pharmacy, the attack on that body being led by C. E. Osseward, of Seattle, a member of the board. The affray began with the reading of a paper by Mr. Osseward, on "What the State Board of Pharmacy Has Not Done," in which he charged the board with having failed to prosecute for violations of the law and with lowering the requirements for registration. Mr. Osseward was supported by the advocates of prerequisite graduation in pharmacy.

Twenty other papers were presented as follows: "First Aid to the Injured," by D. C. Hall, M. D.; "The Relation between the Pharmaceutical Manufacturer and the Retailer," by F. M. Harris; "Drugs of Animal Origin," by Mrs. Agnes Fay Morgan; "The Druggist; His Money; and Its Use," by W. F. Bente; "Salesmanship," by S. N. Swenson; "Tuberculosis," by John Weinzirl, Ph. D.; "The Relation between the Pharmacist and the Physician from the Physician's Standpoint," by M. G. Sturgis, M. D.; "The Enforcement of the National Food and Drugs Act," by H. M. Loomis; "Improved Pharmaceutical Processes," by E. P. Ferte; "Ice Cream as a Food," by J. C. Dunn; "Drug Assaying," by C. W. Johnson, Ph. D.; "Cut-Rate Drug Stores," by Barry Murphy; "Methods of Invoicing," by E. W. Hammond; "Volatile Oils," by R. E. Rose, Ph. D.; "The Pharmacist's Relation to His Societies and the State Board," by D. C. Bartley; "Counter Prescribing," by Mary

R. McGahn, M. D.; "Educational Prerequisites," by A. H. Dewey; "Higher Education in Pharmacy," by A. F. Maxwell; and "Mountain Scenery of Washington," by H. C. Engberg.

The following, all graduates in pharmacy, were nominated to the governor for his consideration in appointing a member of the board of pharmacy: H. C. Engberg, of Bellingham; A. F. Maxwell and E. W. Hammond, both of Spokane; D. B. Garrison, of Connell; and M. A. Weed, of Seattle.

Officers were elected as follows: President, C. E. Osseward, of Seattle; vice-presidents, C. W. Johnson, of Seattle; A. C. Dukelow, of Spokane; and A. E. Johnson, of Spokane; secretary, A. H. Dewey, of Seattle; and treasurer, D. C. Bartley, of Seattle.

West Virginia Association.

The fifth, the most successful, annual meeting of the West Virginia Pharmaceutical Association was held at Webster Springs, July 17th to 20th.

A number of able papers were read, including "Fire Insurance," by B. E. Downes, of Welch; and "The Advantages of a School of Pharmacy at the State University of West Virginia," by E. B. Dawson, of Shadyside, Ohio.

In the resolutions passed, the association pledged its efforts to eradicate the abuse of the privileges of a pharmacist and the illicit sale of narcotics; called upon the officials to enforce more rigidly the anti-narcotic laws; asked the legislature to enact a law prohibiting the itinerant vending of medicines; instructed the legislative committee to work for an amendment to the pharmacy law so as to free the appointment of members of the board of pharmacy from partisan influence, to limit membership on the board to two consecutive terms, and to have the secretary of the board selected from outside the members thereof; favored the election of druggists to the legislature; authorized the employment of counsel; reiterated its discouragement of counter-prescribing by druggists; reiterated its intention of abiding strictly by the excise laws and of striving to separate the sale of liquors from the drug business; extended good wishes to the associations of its sister States; and thanked the retiring officers and its entertainers.

Officers were elected as follows: President, G. O. Young, of Buckhannon; vice-president, S. M. Scott, of Terra Alta; secretary, Arch Krieg, of Charleston; treasurer, W. A. Ream, of Morgantown; and member of the council, W. E. Dittmeyer, of Harpers Ferry.

Next year's meeting will be held at White Sulphur Springs, June 19th to 23d. An invitation will be extended to the Virginia Pharmaceutical Association to meet jointly with the W. Va. Ph. A.

Prof. Beal Aids North Carolina Membership Committee.

We followed a newspaper report into an error in reporting the meeting of the North Carolina Pharmaceutical Association in last month's CIRCULAR, page 435. This was in stating that Prof. J. H. Beal, of Scio, O., was present at the meeting. Prof. Beal was prevented by force of circumstance from attending as he had planned.

Prof. Beal expressed regret for his unavoidable absence, in a letter, in which he also offered to place at the disposal of the association the sum of \$100 to be invested and the income of which to be used to pay each year the initiation fee to the association of the applicant for registration who during that year had the highest general average at the examination of the North Carolina Board of Pharmacy.

This offer was accepted by the association; and the donor was formally thanked.

According to the Chicago *Record-Herald* there were exported from this country during the year July 1st, 1910, to June 30th, 1911, nostrums and other proprietary medicinal preparations amounting in value to more than \$7,000,000.

The travelers' auxiliary of the Minnesota Pharmaceutical Association has on foot plans for the organization of a drug club in Minneapolis. It is purposed to have club quarters as soon as possible.

The Michigan Retail Druggists' Association will meet at Flint, October 3d.

German Society to Celebrate.

Preliminary to their grand annual reception and ball, the members of the New York German Apothecaries' Society will on the evening of September 28th indulge in a fest-kommers at Terrace Garden. This is to be a "stag" affair, at which refreshments will be served in German style. Original songs by members, composed for the occasion, will be supplemented by entertainment by "professionals." W. C. Alpers will preside.

On October 12th, at the same place, the society will celebrate the completion of sixty years of its existence. It claims to be the oldest pharmaceutical organization in the country, and probably is, the American Pharmaceutical Association not having been formally organized until 1852, one year later than the organization of the German society.

This birthday celebration will be on a large scale, many prominent pharmacists from a distance having been invited to attend. It will consist of a vocal and instrumental concert by professional talent, a banquet and a ball.

Secretary Otto P. Gilbert is chairman of the committee of arrangements, the other members of the committee, including most of the other officers of the society, as well as some of the hardest-working private.

It is expected that this anniversary celebration will be one of the most notable pharmaceutical functions in the annals of the country.

Philadelphia Association.

Offered by W. E. Lee, the following resolutions were unanimously passed by the Philadelphia Association of Retail Druggists at the meeting held August 3d:

Resolved, by the Philadelphia Association of Retail Druggists in regular meeting assembled, that we hereby give unanimous approval and expression of appreciation of the efficient manner in which the pure food and drugs act has been enforced under the direction of Dr. Harvey W. Wiley, and, be it further

Resolved, that it is the sense of this meeting that the removal of Dr. Wiley would be a calamity to the nation and a direct blow to the health of every citizen.

Much interest attended the consideration of the approaching meeting of the National Association of Retail Druggists, because the P. A. R. D. is again an affiliated member of the national organization and will send delegates to the convention. It was decided to pay the expenses of the N. A. R. D. delegates.

The delegates to the national convention were instructed to vote for the retention of H. W. Merritt, of Plains, Pa., in the official family of the N. A. R. D. Mr. Merritt is at the present time a member of the national executive committee and it was largely due to his efforts that the P. A. R. D. returned.

Christopher Koch announced that the Pennsylvania Board of Pharmacy was about to take steps to break up the renewed traffic in narcotic and habit-forming drugs in the city. The traffic was, he said, largely in the hands of street agents. Some further mention of the board's campaign is made on page 529 of this issue.

East New York Association.

To the large number of pharmacal organizations existing in Greater New York there was added recently the East New York Pharmaceutical Association, representing the druggists of the East New York section of Kings county. The stated purposes of the new organization are social and uplifting.

The following officers were elected August 18th: President, L. Smith; vice-president, M. A. Lipkind; recording secretary, L. Berliner; financial secretary, M. Gussman; and sergeant-at-arms, M. Hessel.

At this year's meeting of the Alumni Association of the Philadelphia College of Pharmacy, the following officers were elected: President, J. W. Frey, '83; vice-presidents, R. H. Lackey, '87; and W. E. Lee, '72; recording secretary, J. W. England, '83; corresponding secretary, Alfred Heineberg, '90; and treasurer, C. C. Meyer, '73.

At the recent quarterly meeting of the Montgomery County (Pa.) Retail Druggists' Association, held at Hatboro, resolutions were passed endorsing the work of Dr. H. W. Wiley, and deploring the attempt being made to oust him from the federal service.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

- ALABAMA—October 10th, at Montgomery. E. P. Galt, Selma.
- ARIZONA—November 8th, at Phoenix. A. G. Hulett, Phoenix.
- ARKANSAS—J. F. Dowdy, Little Rock.
- CALIFORNIA—October 9th, at Los Angeles; October 16th, at San Francisco. Louis Zeh, San Francisco.
- CONNECTICUT—September 5th, at Hartford. J. A. Levery, Bridgeport.
- COLORADO—S. L. Bresler, Denver.
- DELAWARE—N. C. Downs, Wilmington.
- DISTRICT OF COLUMBIA—October 12th and 13th, at Washington. S. L. Hilton, Washington.
- FLORIDA—January 16th and 17th, at Jacksonville. D. M. Ramsaur, Palatka.
- GEORGIA—C. D. Jordan, Monticello.
- IDAHO—J. M. Starrh, Shoshone.
- ILLINOIS—F. C. Dodds, Springfield.
- INDIANA—October 11th and 12th, at Indianapolis. W. H. Fogas, Mt. Vernon.
- IOWA—October 3d, at Des Moines. E. J. Moore, Des Moines.
- KANSAS—W. E. Sherriff, Ellsworth.
- KENTUCKY—October 10th and 11th, at Mt. Sterling. J. W. Gayle, Frankfort.
- LOUISIANA—F. A. Earhart, New Orleans.
- MAINE—October 11th and 12th, at Augusta. F. W. Bucknam, Skowhegan.
- MARYLAND—Ephraim Bacon, Roland Park.
- MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.
- MICHIGAN—J. J. Campbell, Pigeon.
- MINNESOTA—October 16th, at Minneapolis. C. T. Heller, St. Paul.
- MISSISSIPPI—October 3d, at Jackson. L. H. Wilkinson, Greenwood.
- MISSOURI—October 9th, at St. Louis. C. E. Zinn, Kansas City.
- MONTANA—October 11th, at Great Falls. S. J. Coffee, Missoula.
- NEBRASKA—A. V. Pease, Fairbury.
- NEVADA—November 1st, at Reno. R. L. Prouty, Tonopah.
- NEW HAMPSHIRE—F. H. Wingate, Nashua.
- NEW JERSEY—October 19th and 20th, at Trenton. H. A. Jorden, Bridgeton.
- NEW MEXICO—A. J. Fisher, Santa Fe.
- NEW YORK—September 27th and 28th, at New York, Albany and Buffalo. W. L. Bradt, Albany.
- NORTH CAROLINA—December 5th, at Raleigh. F. W. Hancock, Oxford.
- NORTH DAKOTA—October 16th, at Fargo. W. S. Parker, Lisbon.
- OHIO—F. H. Frost, Columbus.
- OKLAHOMA—October 2d and 3d, at Oklahoma City. J. C. Burton, Stroud.
- OREGON—September 11th and 12th, at Portland. F. C. Pozzi, Portland.
- PENNSYLVANIA—L. L. Walton, Williamsport.
- RHODE ISLAND—October 3d, at Providence. J. E. Brennan, Pawtucket.
- SOUTH CAROLINA—November 15th, at Abbeville. F. M. Smith, Charleston.
- SOUTH DAKOTA—E. C. Bent, Dell Rapids.
- TENNESSEE—I. B. Clark, Nashville.
- TEXAS—September 19th, at Houston. R. H. Walker, Gonzales.
- UTAH—October 17th and 18th, at Salt Lake. W. H. Dayton, Salt Lake.
- VERMONT—D. F. Davis, Barre.
- VIRGINIA—October 24th, at Richmond. T. A. Miller, Richmond.
- WASHINGTON—P. Jensen, Tacoma.
- WEST VIRGINIA—A. Walker, Sutton.
- WISCONSIN—October 3d to 6th, at Madison. Edward Williams, Madison.
- WYOMING—C. B. Gunnell, Evanston.

California Board.

At the summer meeting of the California Board of Pharmacy the following passed the examinations for registration:

As pharmacists—R. J. Boehmer, S. M. Brown, F. V. Butler, L. S. Chambers, W. A. Davis, B. H. Dill, E. C. Groves, H. L. Hallett, A. F. Howard, Frederick Knaus, L. E. Knott, F. S. Lawhead, R. G. Lawson, William Middaugh, J. F. Oldham, Albert Osler, L. T. Reagan, L. P. Roy, L. T. O. Rule, W. P. Ryken, I. H. Schwartz, H. V. Tischhauser, and C. A. Woodson.

As assistants—H. E. Allen, A. A. Beard, Eugene Benthall, L. A. Barget, C. E. Bunnell, J. A. Davison, Ernest Debus, W. G. Downing, Joseph Feigen, Adah Galsin, C. M. Garrett, R. C. Gilliland, H. M. Hubbell, W. H. Johnson, D. S. Katz, G. A. Kirk, C. J. Langer, W. D. W. McCarroll, G. F. Meiser, F. C. Mitchell, V. P. Mulligan, Pauline J. Nast, G. H. Nelson, A. B. Otto, C. W. Parsons, G. C. Pedley, P. L. Pierce, B. C. Pilcher, T. J. Pilcher, E. A. Robinson, E. H. Seeliger, W. A. Straub, A. M. Thompson, H. N. Thompson, J. M. Thompson, C. L. Weaver, O. H. Whiteman, E. C. Wilhite, and D. H. Williams.

Registration as pharmacists was given to the following, without examination, under the provision of the law which extends licensure to persons having a given number of years' experience.

Eugene Babo, Albert Christensen, J. A. DeGaugh, W. H. Hambley, W. S. Houghton, Ernest Laudwehrkamp, E. S. Lieberg, S. E. Parkhill, and W. I. Strain.

The board elected officers as follows: President, J. O. McKown, of Livermore; treasurer, E. J. Moloney, of San Francisco; and secretary, Louis Zeh, of San Francisco.

The board will hold its next meeting October 9th to 20th, examining at Los Angeles, October 11th and 12th, and at San Francisco on the 18th and 19th.

Indiana Board.

At the July meeting of the Indiana Board of Pharmacy, the following applicants for registration were successful:

As pharmacists—R. H. Alexander, of Indianapolis; G. E. Blaney, of Paw Paw, Mich.; S. B. Burg, of Chicago, Ill.; C. H. Drybread, of Franklin; Harry Ewing, of Hope; H. W. Fleming, of Shelbyville; F. J. Freshley, of Plainville; O. G. Gaskill, of Markle; McGrayel Genolin, of Indianapolis; K. H. Gohman, of New Albany; W. F. Graubman, of Chesterton; F. E. Hammond, of Frankfort; G. G. Johnson, of Canadian, Tex.; A. M. Krutzen, of Chicago, Ill.; E. C. Martin, of Goodland; H. B. Miller, of Indianapolis; E. E. Montgomery, of Poseyville; C. E. McKenzie, of Indianapolis; C. N. Reed, and C. C. Ridlen, both of Indianapolis; G. W. Ripley, of Brookston; J. A. Robertson, of Salem; W. F. Robinson, of Denver; H. K. Schwarz, of South Bend; C. B. Stoltz, of Casey, Ill.; M. L. Stutzman, of Goshen; R. McC. Summers, of Indiana Harbor; A. H. Thomas, of Fortville; E. H. Vellinger, of Lafayette; J. W. Wade, of Fairbury, Ill.; and Harrison Williams, of Maunie, Ill.

As assistants—C. W. Bader, of New Albany; O. G. Burns, of Russiaville; Edward Carr, of Mitchell; L. H. Clevenger, of Parker; H. R. Cross, of Indianapolis; S. M. Denton, of Westport; C. M. Echols, of Indianapolis; E. F. Guthrie, of Logansport; M. S. Jack, of Terre Haute; A. J. Julien, of Elkhart; G. W. Kimball, of Ft. Wayne; W. E. Miller, of Shirley; W. S. Miller, of Lafayette; R. E. Morris and C. B. Neidhamer, both of Indianapolis; D. C. Paxton, of Van Buren; C. J. Pollom, and J. E. Ross, both of Terre Haute; Frank Sanders, of Kokomo; G. M. Smart, of Indianapolis; W. E. Steckelman, of Columbus; G. R. Syphers, of Portland; J. LaR. Taylor, and T. H. Winters, both of Shelbyville; W. A. Withers, of Bedford; Lee Wixsom, of Marion; and J. H. Zimmerman, of Ray.

The next meeting of the board will be held at Indianapolis, October 9th to 13th.

A number of prosecutions have recently been made by the board in instances of alleged failure to have a registered man in charge of the store. The convictions have not been many. The board has revoked the registration of several pharmacists who had been convicted of illegal liquor-selling. The cases have been appealed, the authority of the board being questioned.

Iowa Board.

Of the fifty-seven applicants for registration examined by the Iowa Board of Pharmacy at its June meeting, fifteen were successful.

The board has roused quite a furore in nostrum- and de-

partment-store circles by stating its intention to enforce a dead-letter section of the pharmacy law which limits to registered pharmacists the right to sell medicinal preparations containing opiates or alcohol. The board is also after the sellers of poison fly eradicators which are not properly labeled.

Kentucky Board.

The Kentucky Board of Pharmacy met at Paducah, July 11th and 12th, examining nineteen applicants for registration. The nine of these who were successful are:

As pharmacists—H. E. Katterjohn, of Paducah; L. B. Sisk, of Dalton, and T. P. Taylor, Jr., of Louisville.

As assistants—L. E. Coogle, of Louisville; W. H. Giliam and G. P. Holliday, both of Paducah; Clifton Hollowell, of Princeton; G. W. Milliken, of Paducah; and N. E. Thomas, of Wingo.

The next meeting of the board will be held October 10th and 11th, at Mt. Sterling.

Louisiana Board.

Thirty-three candidates for licensure were examined at the meeting of the Louisiana Board of Pharmacy held August 4th and 5th, at New Orleans. The following fourteen were successful:

As pharmacists—T. A. Chisholm, of Woodville, Miss.; A. T. Gonzales, of Gonzales; W. E. Griffen, of New Orleans; J. E. Guess, of Kentwood; A. J. Johnson, A. C. Lopez, J. C. Lynch, and L. J. Pujol, all of New Orleans; C. J. St. Martin, of Laplace; R. J. Sanchas, of Baton Rouge; Virginia Speight, of New Orleans; and R. Williams, of Minden.

As assistants—J. O. Gianelloni, of New Orleans; and E. B. Holbrook, of Kentwood.

The next meeting of the board will be held at New Orleans, November 3d and 4th.

Maryland Board.

Several more convictions have been secured by the Maryland Board of Pharmacy in its prosecution of unlicensed operators of drug stores. An assistant pharmacist attempting to run a store at Baltimore was fined \$15.

Minnesota Board.

Only nine passed of the fifty-four applicants for registration examined by the Minnesota Board of Pharmacy at its July meeting. The nine are the following:

As pharmacists—Alberta J. Austin, of Aberdeen, S. D.; M. J. Gans, of Perham; and H. F. Goodrich, of Anoka.

As assistants—R. J. Boordman, of Rochester; M. H. Haynes and E. O. Holmes, both of Minneapolis; W. R. Laliberte, of St. Paul; N. T. Magnussen, of Minneapolis; and E. J. H. Yaeger, of Sanborn.

The next meeting of the board will be held at Minneapolis, beginning October 16th.

New Jersey Board.

At a result of the July examination held by the New Jersey Board of Pharmacy the following have been licensed to practice in that State:

As pharmacists—Abraham Abelsky, of Jersey City; Osher Briskin, of Perth Amboy; Mary J. Brown, of Trenton; F. C. Brush, of Philadelphia, Pa.; A. H. Carrington, of Merchantville; N. A. Cozens, of Philadelphia, Pa.; H. M. Dichter, of New York, N. Y.; John Drechsler and A. W. Farley, both of Trenton; Jacob Friedland and Abraham Friedman, both of New York, N. Y.; C. E. Gault, of Spring Lake; M. I. Ginsburg, of New York; S. B. Greenwood and W. M. Hahn, both of Newark; Morris Haimowitz, Philadelphia, Pa.; O. C. Hayes, of Manasquan; C. E. Heacock, of Williamsport, Pa.; D. R. Iusi, Morris Kantor and Isidor Kipnis, all of New York, N. Y.; R. H. Knowles, of Millville; H. Lenne, of Ocean City; A. W. Moore, of Trenton; E. J. Novotny, of Jersey City; J. M. O'Donnell, of Philadelphia, Pa.; Antonio Orefice, of New York, N. Y.; Albert Ostroff, of Brooklyn, N. Y.; E. G. Parentini, of West Hoboken; Samuel Rabinowitz, of New York, N. Y.; Joseph Roth, of Passaic; W. L. Rosenkranz, of Hoboken; W. E. Ruch, of Camden; William Sauer, of Jersey City; F. W. Schell, of Harrisburg, Pa.; Herman Strauss, of Bayonne; W. H. Udell, of Philadelphia, Pa.; A. V. Utzinger, of Plainfield; Frank Walkenberg, of Newark; Joel Weiner, of Malden, Mass.; and L. M. Wolchek, of Philadelphia, Pa.

As assistants—A. F. Calvin, of West New York; Vincent

Chaine, of New York, N. Y.; R. P. Fischelis, of Philadelphia, Pa.; Oscar Fraller, of Newark; C. D. Hakes, of Orange; H. F. Hein, of Manasquan; Nathaniel Kessler, of Newark; E. H. Kuhn, of Paterson; S. G. Levin and Alfred Maier, both of Newark; E. E. Sandbach, of Jersey City; and August Weisbrod, of Newark.

HENRY A. JORDEN.

Governor Woodrow Wilson has reappointed as a member of the board to succeed himself, Henry A. Jorden, of Bridgeton, who was first appointed to the board by Governor Griggs in 1896. Mr. Jorden has been the secretary and executive officer of the board from the time he first became a member. Doubtless he served well, for he differs in political views from the State executive who has retained him in the service of the commonwealth. He is a man who is "always on the job" when there is a pharmaceutical simmering in the legislative halls at Trenton.

The next meeting of the board will be held at Trenton October 19th and 20th.

North Carolina Board.

At the meeting of the North Carolina Pharmaceutical Association held July 7th, at Morehead City, sixty-two persons were examined as to their fitness to practice pharmacy. Thirty-two of these were successful, being the following:

J. M. Anderson, of Greenville; E. J. Barker, of Rowland; E. W. Barnes, of Kings Mountain; H. R. Browning, of Litleton; James Callahan, of Red Springs; B. J. Cottle, of Wilmington; G. M. Cox, of Lowell; E. P. Cranford, of High Point; F. D. Culpepper, of Spring Hope; Lee Davenport, of Pictolus; J. S. East, of Asheboro; S. G. Etheridge, of Elizabeth City; J. F. Frederick and C. B. Gallant, both of Charlotte; P. V. Godfrey, of Elizabeth City; J. W. Hairston, of Martinsville, W. Va.; J. C. Hood, of Smithfield; W. E. Horton, of Durham; Alpheus Jones, of Warrenton; W. C. Lane, of Goldsboro; M. T. Y. McManus, of Wake Forest; J. P. Moore, of Cary; J. C. Murphy, of Hickory; L. A. Reeves, of Chapel Hill; Cader Rhodes, of Jacksonville; J. C. Shelton, of High Point; Casper Smith, of Lumberton; E. W. Smith, of Pilot Mountain; J. E. Spencer, of Durham; E. S. Swindell, of Swan Quarter; W. G. Thomas, Jr., of Raleigh; and B. C. Toms, of Rutherfordton.

The next meeting of the board will be held at Raleigh, December 5th.

Oklahoma Board.

There were forty-nine applicants for registration at the meeting of the Oklahoma Board of Pharmacy held July 11th and 12th, at Oklahoma City. The following eighteen were successful in the examination:

O. J. Bellwood, of Turon, Kan.; E. H. Brune, of St. Louis, Mo.; L. W. M. Burton, of Sapulpa; F. S. Clancy, of Tulsa; Dr. L. D. Conn, of McCurtain; Mrs. Minnie I. Downes, of Luther; Manuel Gonzales, of Wichita, Kan.; W. A. Hatchett, of Weatherford; C. R. Healey, of Altus; W. E. Keller, of Muskogee; W. J. Kuntz, of Kansas City, Mo.; R. D. Ludden, of Mooreland; R. E. Mitchell, of Caneley, Kan.; Finis Sharp, of Wetumka; S. A. Strader, of Carney; G. B. Thomas, of Guthrie; C. R. Thornton, of Cordell; and F. M. Walker, of Oklahoma City.

The following graduates in pharmacy were licensed to practice, without examination:

D. M. Garland, of Fort Gibson; M. S. Kirkendall, of Tuttle; J. G. Luse and O. P. Luse, both of Muskogee; Ella D. McCance, of Mutual; O. J. Machenheimer, of Shawnee; V. M. Mulkey, of Pond Creek; F. E. Robinson, of Kingman, Kan.; Josephine Stanber, of Oklahoma City; and W. R. Wheeler, of Buffalo, N. Y.

The following licensees of boards of other States with whom the Oklahoma board has reciprocal relations were licensed without examination:

I. N. Bowdle, of Cordell; O. J. Bressie, of Ponca City;

C. E. Lee, of Nowata; J. L. McColm, of Bartlesville; and H. D. Thornton, of Murray, Ky.

The next meeting of the board will be held October 2d and 3d, at Oklahoma City.

Oregon Board.

Several drug-store proprietors have been apprehended by the Oregon Board of Pharmacy on a charge of leaving their places of business in charge of unregistered clerks. One Chinese store at Salem was among the offenders.

Leon B. Haskins, of Medford, has been appointed a member of the board, succeeding Clyde G. Huntley, of Oregon City, whose term expired this year.

Pennsylvania Board.

Some seventy-odd warrants have been prepared at the instance of the Pennsylvania Board of Pharmacy for dealers in paints and photographic supplies alleged to have sold potassium cyanide, mercury bichloride, phenol, oxalic acid, and other poisons without complying with the labeling and registering provisions of the State law. About thirty arrests were made August 17th and 18th.

The board has also under way another campaign against dope-sellers.

South Carolina Board.

Of thirty persons making application for registration but twelve passed the examination of the South Carolina Board of Pharmacy at its summer meeting. The successful ones are:

J. T. Crawford, of Union; A. M. Criminger, of Lancaster; E. O. Frierson, of Anderson, J. J. Graham and A. M. Hill, both of Greenville; H. H. Huggins, of Manning; R. F. Kee, of Chester; D. G. Mahon, of Abbeville; G. W. Mouzon, of Greenville; C. E. Powe, of Hartsville; G. T. Riley, of Spartanburg; and V. T. Wilson, of Anderson.

The next meeting of the board will be held November 15th, at Abbeville.

Texas Board.

At a called meeting of the Texas Board of Pharmacy held at Dallas, in June, sixty-seven applicants for registration were examined. Nineteen of these were successful, as follows:

As pharmacists—E. W. Bass, of Galveston; J. W. Cooper, of Hillsboro; V. C. Cupp, of Lufkin; C. M. Frazier, of Dallas; C. E. Hill, of Austin; L. F. Hooten, of Cooper; Mrs. Elma Kavanaugh, of Fairy; R. G. Lewin, of Beaumont; Jonathan McClain, of Marshall; T. C. McCormick, of Rouse City; A. T. Mast, of Nacogdoches; L. M. Rogers, of Marshall; W. J. Roland, of Anson; Isadore Schaffer, of Houston; J. F. Seymour, of Beeville; G. W. Shaw, of Wichita Falls; Bertha Urdong, of Center; and F. A. Walter, of San Antonio.

As an assistant—Beth A. Michel, of Marble Falls.

The next meeting of the board will be held September 19th, at Houston.

Utah Board.

At the meeting of the Utah Board of Pharmacy held July 18th and 19th, at Salt Lake City, two applicants for registration passed, out of seven examined. The successful ones are:

W. S. Musser, of Salt Lake City; and Walter Rampton, of Farmington.

F. F. Ziddell was registered without examination, the first person to be licensed under the reciprocal provisions of the law.

The next meeting of the board will be held October 17th and 18th, at Salt Lake City.

Virginia Board.

At the meeting of the Virginia Board of Pharmacy held July 18th, at Richmond, there were examined twenty-seven applicants for registration as pharmacists, and twenty-two as assistants. The successful ones numbered fifteen and twenty in the respective grades. Those who passed are:

As pharmacists—R. E. Blankinship and A. J. Bowles, both of Roanoke; Mrs. W. B. Boyd, of Mineral; T. E. Carper, of Gate City; C. L. Coleman, of Richmond; R. J. Connor, of Stuart; C. L. Halstead, of Norfolk; E. G. Johann, of Richmond; L. C. Leatherland, of Alexandria;

W. E. Locke, of Richmond; P. M. Massie, of Lynchburg; J. R. Ortega, of Dendron; C. H. Thomasson, of Emmerton; M. B. Turner, of Front Royal; and W. B. Wilson, of Orange.

As assistants—A. A. Arnold, of Franktown; T. H. Bryan, of Norfolk; S. P. Buchanan, of Coeburn; H. R. M. Cecil, of Dublin; W. G. Crockett, of Tazewell; W. C. Gleason, of Portsmouth; E. A. Hale, of East Radford; H. R. Hamlett, of Honaker; Frank Hogshead, of Staunton; V. R. May, of Richmond; R. E. Monroe, of Purcellville; R. L. Ogg, of Craigsville; F. S. Otey, of Wytheville; C. D. Rady, of Richmond; B. M. Roberts, of South Richmond; R. T. Scott, of Richmond; R. W. Staton, of Roanoke; H. M. Surface, of Richmond; T. J. Williams, of Buena Vista; and L. C. Wombell, of Richmond.

The next meeting of the board will be held at Richmond, October 17th.

Wisconsin Board.

Sixty applicants for registration were examined at the meeting of the Wisconsin Board of Pharmacy held July 11th to 14th. The following thirty-two were successful:

As pharmacists—L. W. Byron, of Madison; W. H. Cooper, of Bangor; A. A. Johnson, of West Salem; E. A. Lorch, of Madison; O. E. Nelson, of Marinette; A. R. Schmidt and B. S. Schoenkerman, both of Milwaukee; Dean Swift, of Edgerton; Robert Thieman, of Sheboygan; R. J. Tiedeman, of Madison; A. G. Wepfer, of Neillsville; W. H. Widule, of Milwaukee; B. A. Wiechmann, of Wausau; L. F. Winterburn, of Neenah; and H. F. Zimmerman, of Milwaukee.

As assistants—R. E. Alf, of Columbus; Harold Baebenth, of Kenosha; Alfred Bjerke, of Eau Claire; E. C. Deno, of Waukesha; E. F. Flintrop, of Milwaukee; F. J. Houghton, of Waukesha; G. H. C. Hoyer, of West Bend; O. A. Hoyer, of Watertown; Arthur Jensen, of Withee; A. P. Malone, of Waukesha; A. E. Manthei, of Ripon; J. G. Matt, of Milwaukee; A. E. Potter, of Oshkosh; Lawrence Ramsey, of Milwaukee; L. D. Stephenson, of Madison; Herbert Villmow, of Milwaukee; and Charles Whitebread, of Washington, D. C.

F. G. Stenicka, of Chicago, Ill., was registered under the reciprocal relations of the board with the other boards constituting the Interstate Association of Boards of Pharmacy.

The next meeting of the board will be held October 3d to 6th, at Madison.

Well-Known Philadelphia Store to Move.

After a continuous location for more than half a century at 1410 Chestnut street, Philadelphia, the Llewellyn Pharmacy, now owned and conducted by H. C. Swartley, will shortly be removed to a new building at 1518 Chestnut street. Mr. Swartley has purchased this building, which is being entirely remodeled with a view to affording greatly improved facilities and more room for the needs of his business. The store is one of the best-known in Philadelphia, and its reputation as a prescription pharmacy is country-wide. The business was begun in 1857 as Hubbell's Pharmacy.

An interesting feature of the store's history is that the three pharmacists who owned it since Mr. Hubbell retired, all started to work in the store in a minor capacity. The second owner was Dr. McKelvey, who had been a clerk under Mr. Hubbell. The next owner was W. H. Llewellyn, who had been a clerk; and, a few years ago, Mr. Swartley, who had long been in the employ of Mr. Llewellyn, assumed ownership. Another interesting feature is that each of the owners is said to have accumulated a fortune in the store.

J. W. Beckwith, formerly a pharmacist at Flushing, N. Y., is now a farmer at Strathmore, Alberta. The transition from an apothecary shop to the broadest plains and wildest scenes in civilized North America must be so great as to make ex-Brother Beckwith dizzy for a while.

Galvanizing the clerks is an effective way of transmitting the advertising current to the customers. Sales increase in direct ratio to the interest and enthusiasm of the salesmen.—*System*.

He is now Grandpa Bodemann, since Wilhelm Robert Julius Eichenberger's arrival, August 5th, and maybe he isn't as fussy about it as if he were the whole thing.

DRUG STORE MERCHANDISING

Advertising for Retail Druggists.

Among the Men Who Live and Think Advertising—
Honesty in Advertising—Advertising as an Investment—A Belief in Advertising an Aid to Success.

By M. P. GOULD.

During the first week in August about 2200 men interested in advertising came together from various parts of the country at Boston to the seventh annual convention of the Associated Advertising Clubs of America. In this company were publishers of newspapers, publishers of magazines, advertising managers of manufacturing concerns, solicitors of advertising, manufacturers of advertising novelties, painters of out-door signs, booklet distributors, advertising agents; in fact, every phase of advertising was represented.

The remarkable thing about this great convention was the sincerity and the interest with which those attending took hold of the problem of advertising. The advertising managers of the various big national advertisers met in a conference of their own. They were trying to find out all the possible ways of making advertising more effective. One afternoon, in a general sitting, a publisher of a Michigan newspaper stirred the visitors deeply by putting stress on the point that the publisher hurt the influence of his own paper if he printed in it advertising which was not true.

On another day the advertising agents spent considerable time in discussing whether it was ethical for an advertising agent to publish a periodical in which he printed advertisements for newspapers and magazines. This question was discussed because some of the craft believe that an advertising agent must be unprejudiced, must study the actual worth of every magazine and newspaper and every other form of advertising from an unbiased standpoint so that he can give his clients an absolutely unbiased judgment as to which forms of advertising and which mediums will pay the advertiser best. Some there were who thought that, when an advertising agent publishes a paper of his own and accepts or solicits advertisements from newspapers and magazines, the money which the other medium pays for the advertisement is but another form of a bribe to induce the advertising agent to advise an advertiser to use the magazine or newspaper in question whether it is suited to the advertiser's needs or not.

At another sitting the discussion, a very lively one, had to do with the establishing of a one flat rate by every

newspaper. That is, each newspaper should make the same rate to its little retail customers as to the big department stores; the same rate to the national advertiser as to the local advertiser; the same rate to an advertising agent as to a national advertiser. In other words, the newspapers should be just like the big magazines, have one rate for everybody and not favor one class of advertising more than another. If such a condition could be established it would be a great thing for everybody, the newspapers included.

The one note which seemed to run through the entire convention from start to finish was the desirability of strict honesty and high standards of ethics.

It was generally recognized that the better magazines have done a great thing for the whole United States and for all classes of people by refusing to print certain advertising held to be questionable and by setting a high standard for the kind of advertising which they would print; in other words, making their pages clean and attractive. Representing every class of advertising there were men at the convention who seemed anxious to cut out from advertising anything that was questionable, anything that was insincere, anything that detracted from the respectability of advertising.

At one meeting a public accountant who is known all over America for the great work that he has accomplished in examining great corporations, read a paper dealing with the question of whether advertising should be entered in the account of the advertiser, as an expense or an investment. He pointed out very clearly that, with a reputable house, doing a successful business, no matter how small the house was, advertising should be charged on the books as an investment adding to the value of the business advertised.

This is a point which every druggist ought to consider. So many retailers are in the habit of thinking that advertising is an expense; that it is a form of fixed charges which they must carry; that it does them very little good—but they are unwilling to stop it. Some even go so far as to look upon it as a form of blackmail. It would have done such people a world of good to hear this public accountant before a great convention giving his experiences based on the examination of the accounts of many different concerns of all kinds to show how a business which advertises well can be sold for more money, all else being equal, than one that does not advertise well, and that the difference in the prices for which the two would sell would be the amount invested in advertising.

Every retail merchant should be a member of the local advertising club if there is one in his town. If there is not

he should join a club in a near-by city, because the retailers and manufacturers and big corporations realize that a billion dollars a year spent in advertising warrants the most careful study of the possibilities of advertising.

The retailer who spends his money in advertising, without studying human nature, is bound to waste a large part of his advertising investment.

So many retailers keep on advertising in the same old way year after year. They seem to forget that:

"Thus times do shift—each thing his turn does hold;

New things succeed, as former things grow old."

Advertising has changed the whole method of conducting retail stores. It has changed the viewpoint of the store-keepers themselves. It has made retail merchants more honest. It has given the buying public more confidence in retail stores. It has educated the public to know

Now the retailer who does not bear these facts in mind cannot do his advertising as he should. The retailer should keep sight of two things all the time. First, he should try through his advertising to share in all general and local advertising. Secondly, he should with his advertising create new needs for

the goods which he handles. The question of how he can do these things is his problem of advertising.

The dealer who sticks so close to the task of selling that he cannot get a clear mind to think over the methods of advertising is putting blinders on himself so that he can only see in one direction. He is handicapping himself. He is hobbling his commercial genius.

If the retailer will try to forget his habits and customs and prejudices, and just open his mind to the reception of new ideas he will very soon find himself acquiring progressiveness. If a man is sent out on to the street to pick up papers he will after awhile see nothing but papers on the street. He will grow to believe that a great part of the population is spending its time throwing papers on the street for him to pick up. If the retailer looks at advertising in the right light he will very soon find that it is a constant stimulant to his ambition, a constant means of his seeing and working out new ways of getting business. His store will soon take on a progressive appearance because he will find that the more he puts new life into his store the more new customers will put money into his cash register. A man cannot work with advertising and not wake up and become ambitious.

The man who treats advertising as a carrying expense had better stop it altogether, because treated in that light it does him no good; it is a waste of money. He who treats it as an investment will try to make that investment pay; and as he tries seriously to do that he will soon find the ways to make it pay.

Opening for a Drug Store.

On the Sun River irrigation project about twenty-six miles west of Great Falls, Mont., a public auction will be held September 27th, at which time a number of choice business and residence lots will be sold for cash in the government townsite of Simms. There is need at this time for a drug store to supply the needs of this rapidly growing community. At the present time settlers are obliged to drive to surrounding towns, at considerable trouble and cost.

The statistician of the reclamation service at Washington, D. C., will be glad to furnish, upon request, detailed information concerning this country, its resources, and opportunities.

The Plunge

A big "roomy" sponge, a cake of dainty soap, a full-sized bath towel, a tin of talcum powder, one of our special bath sprays, and there is no regret for seashore or lake. Here's an outfit for \$2 that will give you a hundred dollars' worth of luxurious bathing.

(Name and address)

Prescriptions

At all times the health must be carefully guarded; particularly now in the changing seasons. Do what you can to prevent sickness—but, if it come, place the responsibility of supplying the medicines upon us. Bring every prescription to us and know that you get the most active drugs, carefully and honestly compounded—for best results to the patient always.

(Name and address)

what real values are, not only in goods but in the service which the store should render its customers. Advertising has educated the public to new needs. It has taught them how to spend their money so that they may live better, dress themselves and their children better, have more comforts in the home; and it has taught them how to take care of their health better. It is constantly creating new needs in the public mind.

SODA

YOU don't appreciate soda until you try ours. So rich, luscious, icy, inviting and pleasing—any flavor you want, any combination. :: :: ::

CANDY

DELICIOUS chocolates, bon-bons and other confections of a hundred varieties. None purer, none more dainty or tasty can be made. In bulk or boxes.

(Name and address)

CIGARS

HERE are cigars to meet every smoker's fancy in strength and flavor. All sizes and shapes; domestic and imported tobaccos. One at a time or by the box.

Does Advertising Pay?

Some Kinds Do Not—He Is a Wise Man Who Knows
What Kind to Avoid, and How—Side-Stepping
the Advertising Grafter.

BY VICTOR LAURISTON.

"It pays to advertise," murmured Wilkins mildly. "Say, Jimmy, when did that fellow say his ball game came off?"

"Tuesday. Going to bet on the Sarnia bunch?"

"No. I was just curious."

"Take it from me, boss, we'll lick 'em to a frazzle, even if it is on their own grounds and——"

"Their own grounds!"

Wilkins jumped a couple of feet, and came down with a mournful whistle.

"Stung again!" he muttered.

He strolled thoughtfully down the store, and, gazing past the elaborate window display of toilet soap at three cakes for a quarter, watched the passers-by on Main street.

"Here I've paid a dollar for the privilege of having my advertising printed on the back of five hundred score cards of the Sarnia-Carisdorf baseball game, only to discover that the game comes off in Sarnia. And I'm trying to do business in Carisdorf. Oh, advertising pays all right—that kind!"

He grimly addressed the tall red and yellow and green bottles in the corner of the window. Concluding, he retreated thoughtfully behind the dispensing case, where, resurrecting a big ledger, he reflectively turned the pages. Across the back of the fat cloth-bound volume were the words, "Bobbey Drug Store," in imposing capitals, printed in red ink.

"Advertising account. Advertising account," said Wilkins, over and over, doubtless on the principle that calling the account by name would help him to find the desired page. "Tom Bobney used to charge every item he paid for advertising. Ah—here we are!"

In Tom Bobney's scraggly, irregular hand the portentous word "Advertising" staggered across the head of a ledger page. From item to item, from column to column, from page to page, the eye and pencil of Wilkins followed the tale of Tom Bobney's advertising exploits. Certainly, if advertising paid, Tom Bobney should have rolled in wealth instead of suffering his store to be sold in foreclosure proceedings.

"Theater programs—concert programs—school concert—subscription to ball team—hospital subscription—Grace Church Ladies' Aid—St. Martin's Church missionary fund—hotel blotter—Central Church building fund—gun club—show tickets!" Wilkins paused, with a whistle. "Well, if there's any kind of advertising—except worth-while advertising—that that poor old goat didn't butt into, I'd like to know what it was."

Upon ascertaining the total amount, he whistled again, and more sharply. "No wonder the poor cuss floundered beyond his depth; five hundred odd dollars for advertising in a single year, and all the publicity he landed for his money wasn't worth five hundred stivers. And another poor cuss is going to flounder beyond his depth pretty soon unless he commences to touch bottom. Why, these skin games have cost me a stack of ducats already."

Jimmy gently kicked the counter, which, in store parlance, signified "Fore!" Wilkins, hastening "fore," found an aggressive-looking young man with a handful of tickets.

"Going to help us out, Mr. Wilkins?" he questioned. "Two tickets, I suppose?"

"What for?" asked Wilkins, casually.

"Football game," returned the young man, inconsequentially. "Fifty cents a ticket. You get your name on the subscription list as one of the patrons—good advertisement—help draw business, y'know. Tom Bobney always bought a couple of tickets. Draws a pile of trade from the sporting fraternity and——"

"When's the game?" questioned Wilkins, softly.

"Thursday afternoon at two."

"Sorry," murmured the druggist, regretfully, "but I can't get away. That's my busy hour."

"Oh, take 'em, anyway. Good advertisement, y'know."

"Sorry," returned Wilkins, still in the same subdued key, "but really, I don't know. I can't see where the advertisement comes in."

"See here, aren't you going to help us? If you don't——"

"Don't tell me, please," chirruped Wilkins, joyously, with the glint of battle in his eye. "I'll probably find out soon enough, for I certainly won't help you."

"You can just bet you'll find out," snapped the aggressive young man. "If you don't, my name ain't Hiram Jinks."

He clattered angrily out of the store.

"Jimmy," murmured Wilkins, "why is our Hiram angry? I told him I couldn't attend his football game. Why should I purchase a ticket when I positively can't go? Would Hiram Jinks buy toothache drops from me if he had a set of false teeth, or medicine if he didn't need it? Did Hiram Jinks ever buy anything from me, anyway—or did he ever buy anything from Tom Bobney, either, after Tom tried to collect that fifty dollar account of his that's still on the old books and always will be?"

Jimmy did not answer.

If Hiram Jinks seethed with anger, that was as nothing to the bubbling emotions of E. J. Scotten when, next day, Wilkins politely pointed out that he had no personal interest whatever in the reception in honor of the supreme pachyderm of the Antiquated Order of Elevated Elephants, and didn't feel like chipping in for the banquet to be tendered that exalted individual.

"Why," protested E. J., "a dollar's neither here nor there with you. And just think of the adver——"

"But," interrupted Wilkins, "I'm thinking of my friends in the order. I don't want to set them all by the ears."

E. J. Scotten stared.

"Yes. I know that if I were an elevated elephant—which, unfortunately, I'm not—and the supreme pachyderm visited my lodge, I'd feel like cussing if any outsider intimated that our order wasn't equal to providing him a royal welcome without begging for charity. Why, if a fellow came along and offered me money to help for a thing like that, I'd kick him from here to kingdom come. I'll never whisper a word of this to anyone, Scotten—I know you meant well, but I'm rather afraid that if the elephants come to hear of it they won't like the notion and——"

Scotten nearly fell over himself in his wild anxiety to escape.

Before the afternoon was through a committee of women called to solicit aid for their church bazaar.

"I would like to help you, really," declared Wilkins, "but to do so directly is against the rules of the store. However, I can assist you indirectly. Here is a fine line of combs, and you will notice——"

He told them about the combs. One of the women shifted nervously.

"But, Mr. Wilkins——"

"Ah—you prefer something like this, I should judge—an article especially suited to anyone with a distinctly youthful appearance. Now, these combs would cost you ninety cents a pair if you ordered them from a city department store, and you'd have postage and incidentals besides. I am able to offer them at the amazingly low price of fifty-nine cents, so that you save thirty-one cents on each pair of combs. That will be ninety-three cents for your bazaar if you each purchase a pair—forty-three cents more than you asked me to contribute."

Wilkins watched with satisfaction their precipitate retreat.

"The minute she can give the others the slip that youngest one will be back here to buy those combs," the druggist muttered with conviction.

Except for a committee asking a prize for the school sports and several individuals with "advertising" propositions which wouldn't wash, the next few days passed uneventfully. The individuals came to beg and remained to listen to interesting talks on quality and price.

The third day brought an honest-faced, straight-forward, clear-eyed young fellow.

"You believe in advertising, Mr. Wilkins," he remarked, pleasantly. "I have here the best advertising proposition ever offered."

He explained the proposition. It had to do with a school concert program. He himself was the teacher of a country school where the concert was to be held. The idea was to sell enough advertising on the program to pay for the printing and leave a good margin of profit. Finally, he unfolded the program, all mapped into little squares.

"This inch space costs only one dollar," he remarked.

"Only one dollar," remarked Wilkins, in a tone of sur-

prise. "Well, let's see. How many people will attend this concert?"

"Why, everybody in the school section and quite a few from outside."

"But, confidentially, how many—make an outside estimate."

"The school will be crowded—that's one sure thing."

"And your school seats fifty pupils. Put chairs in the aisles, allow for some people standing throughout the performance—you'll have probably two hundred people there, counting performers. Of course, your pupils take part in the program—"

"Ye-es—"

"Each young man takes his best girl, and each husband takes his wife. So, deducting the fifty or less pupils and younger children, and allowing for wives and sweet-hearts, there'll be at most fifty heads of families—no more."

"I—I daresay that's about it," muttered the teacher. Though he hadn't quite caught the drift of the argument, he apparently had a more than vague suspicion that the drift was not in his direction.

"So I pay two cents per family for a little announcement on the back of this program. Now the light in your school room will be poor. Hence, these people won't read except what is absolutely necessary. Most of them will come in couples and will be more interested in each other's conversation. Then, the program will take most of their attention. So that there's precious little chance of this advertisement being read at all that evening; and they won't likely take the program home, or, if they do, it will be just to light the fire with next morning."

Pausing, he gazed meditatively into the young man's honest eyes.

"See here, I like you," he exclaimed, suddenly. "But don't you know that for the same money I can secure an equal display space in a daily newspaper right here in my own city, not for three hours in a single evening, but for two weeks. Instead of fifty heads of households, the newspaper goes to nearly fifteen hundred in that city, and as many in adjoining towns. Each household averages five readers—but let that pass. Instead of paying two cents per household for people all outside the city for just one night, I pay one-fifteenth of a cent per household for twelve nights right inside this city—and secure the outside circulation thrown in for good measure. Why, friend, you surely wouldn't ask me to put money into a thing like that as a purely business proposition. I know you wouldn't."

But the young man did not answer. His jaw dropped appallingly. He blinked at Wilkins for several moments as though these statistics were beyond his comprehension. Then, without a single word, he tottered out.

"Jimmy," remarked Wilkins, after a long and solemn silence, "isn't it a ghastly procession? Honest skin games, well meaning frauds, highway robbery committed or attempted with the most praiseworthy motives! And it goes on day after day, day after day. None of these people ever think, either, of going to the private houses. It's the merchant, the merchant, the merchant—always the merchant. The merchant, Jimmy," he concluded, sadly, "is the man who can't get away."

Advertising Postage Stamps.*

Many stores sell some lines of merchandise on a narrow margin of profit, but there are few merchants who persistently advertise goods upon which there is no profit whatever. The only store we have ever heard of that does this is Swift's Little Department Store, of Los Angeles, Cal. Mr. Swift runs a variety store in a residence neighborhood, and for years he has been advertising postage stamps. And he advertises them just as though they were any other kind of merchandise. For example, every once in a while he comes out with something like this: "A Fine Assortment of Postage Stamps—New Goods Received Every Week—Latest Styles, Etc." We think that is pretty good advertising. It is advertising a public convenience and an accommodation that many people will appreciate.

There is interesting information at this office awaiting C. C. White, a soda-water dispenser, formerly of Cincinnati, Ohio.

* From the Merchants' Record and Show Window.

Pulling One's Self Out of a Hole.

The Story of a Man Who Found Himself "in Bad" with Respect to a Store He Had Bought, and How He Turned Defeat into Victory.

BY THE MAN WITH THE PULL.

I had come from the city and bought a drug store in a small town. I hated to admit it, even to myself, and postponed doing so as long as I could, but the evil day at last arrived when I had to admit that I was stuck. Neither the stock nor the trade was what I had expected and been led to believe it was. In short, I was facing failure—losing money every day the store was open. I had arrived at a point where something had to be done.

TOOTH BRUSHES.

One day an individual in seedy clothes and worn appearance called at the store and said that he had a bankrupt stock of tooth brushes on his hands which he wished to dispose of. I told him that I did not want the lot. He named an exceedingly low price, so low in fact, that I suspected him of having obtained the goods in a dishonest way, particularly as he did not look very prosperous. He convinced me that this was not the case, and finally I agreed to put his stock of brushes on sale on commission.

In a few days several good-sized packages of tooth brushes of all styles, grades and kinds arrived and these we piled in the show window in uneven heaps. We put a placard out, reading—

: YOUR CHOICE FOR 10 CENTS. :

Now some of these brushes were really of a high grade. I selected some for my personal use that were worth 25 to 50 cents easy enough. I selected a few more for the show case, but let the bulk remain piled in the window. I calculated upon disposing of some of the brushes in this way and intended to return the balance to the original owner.

The townspeople were not accustomed to seeing advertising done in this way. They had not seen heaps of goods piled in city-store fashion and put in at bargain prices. What was the use of going to the metropolis and spending time and car fare to get a bargain while the local drug store was offering just as great a bargain? I imagined that the folks argued thus as they looked in upon the pile of brushes in the window and went home and told others about it after they themselves had entered the store and made a choice of a good "quarter" brush for ten cents. In three days all the brushes were gone. The patrons not only cleaned out the pile of brushes, but many of them lingered in the store and bought other things.

A NEW STORE FRONT.

This brush sale set me to thinking. I thought long and hard. I sent for a builder and made a contract with him to tear out the entire front of my store, and in place of the somewhat meager glass front, put in a modern plate front well adapted to exhibition purposes. I had the window lowered to near the sidewalk level. The interfering posts and partitions were removed. Two weeks were consumed in doing the work and the cost was nearly \$400. But I had a plan in mind and determined to put it through or "bust." I had lost quite a sum of money since buying the store, and felt that things could not be much worse.

BARGAINS IN SOAPS.

As soon as the store front was right, and I had arc lights put in, and done everything possible to make the store attractive from the outside, I proceeded with my next step. I went to the city and visited the wholesale districts where bankrupt and bargain lots of druggists' goods were obtainable. One of the first bargains I located was in the toilet soap line. The soap looked all right and proved to be of good grade. The wrappers which were once gaudy and attractive were dusty, faded and shopworn. The soap boxes were broken and bent. But the soap itself was O. K. So I bought several barrels of the stock, which when new was neatly packed and listed at high prices. I got the soap so cheap for spot cash that I was able to make another heap in the show window, this time of toilet soap for three cents a cake. Now some of the cakes were not worth much more than

the price stated, but others were worth several times this value. Hence the chance for the bargain hunters.

I had ascertained that my brush sale had equipped a partly depleted community with tooth brushes, and now I was about to fit out the neighborhood with soap. I was more than a merchant; I was a missionary. Everyone who had bought brushes, and some who had not, seemed to come along during the soap sale to stock up with soap. Some even asked when the next special sale would be, and what would be offered.

I cleared enough on the soap deal to give me fresh courage. I wondered if it would not be a good plan to run a bargain window for a time each season for the purpose of disposing of old stock in quick time with moderate profits.

RUBBER GOODS AS A LEADER.

Next I undertook to handle a rubber goods stock which had been closed out by a rubber goods store. I obtained the services of a good looking sister of one of my clerks for \$2 per day and evening, to stand in the window with a waterproof garment over her shoulders, upon which fell a fine spray, in imitation of rain, from a spraying device put in by the plumber just overhead in the show window. The young woman stood in a zinc pan, which was furnished with a drain to carry the water away. Some green boughs were cut and distributed overhead to hide the pipes and below to cover the pan, so that the girl looked quite attractive in the surroundings, with the rain effect. There was a crowd about the window all the time. In the evening the exhibit was illumined by a spot light with various colors produced with stained glass. The spot light was made with a magic lantern set of lenses behind which was a gasoline vapor light of about 200 candle power.

The stock of rubber goods was disposed of at paying prices in less than a week.

CAMERAS, COLD CREAMS AND CUTLERY.

Next I began asking the people questions concerning what they would like next as a bargain. People also came to me and mentioned things desired. For the next six months I made reasonable profits on my investment in the store by handling bargains of bankrupt stores.

I sold a lot of cameras at ridiculously low prices and still I made a profit. In less than a week after I had the people supplied with cameras, I was obliged to establish a film and developing agency in my store and this agency cleared enough for me as time passed to make it quite an object.

Cold cream bargains, bargains in cutlery and the like came in turn and helped advertise my store and procure new business for me. I hired an additional clerk. I increased the pay of my two old clerks. I lost some hundreds of dollars on the original investment, but the store is making money for me now and I am satisfied.

Getting After the Vacationist's Trade.

At the beginning of the summer exodus, which is particularly heavy in their neighborhood, G. H. Hitchcock & Co., Sixth avenue and Fifty-eighth street, this city, sent to their customers and enclosed in all packages a card worded as follows:

G. H. HITCHCOCK & CO.,
Professional Pharmacists.

Wish to announce to their many patrons and the public generally, that they carry a very large stock of every thing usually supplied by pharmacists and that they have special facilities for shipping same into the country. They would be pleased to receive your order for anything desired in the way of drugs, toilet articles, sick room supplies, etc., and can guarantee that you will receive the best and freshest goods the market affords, and in the shortest time possible, delivered either to your country or city home. Too much care cannot be used in selecting a place for the filling of your prescriptions. The house of G. H. Hitchcock & Co. has a reputation to maintain in this line of work, made by using only the proper ingredients, in the correct proportions, and put together in a scientific manner. Your prescriptions should be intrusted to this house, which has the confidence of the physicians of New York.

Sixth Avenue and Fifty-Eighth Street, New York.

As between a good stand and poor service and drinks, and a poor stand and good service and drinks, the public finds little difficulty in deciding. But a good stand, good service, and good drinks is a combination that can't be beaten.

"Detailing" Physicians.

Some Essential Qualities which Must Be Possessed by the Detail Man—A Good Man Behind a Good Preparation Means Success.

By EDWARD C. LAVERTY, M. D.

[The following article on "detailing" is by a physician who has done work of that nature in a large way. What he says should prove of interest to druggists who wish to engage in a similar line of work.—Editor THE DRUGGISTS CIRCULAR.]

Doing detail work among physicians is one of the most profitable occupations that a pharmacist can engage in. The druggist who pours from one bottle to another a preparation made by some distant house, and prescribed by a physician, is merely a merchant, as by so doing he allows the manufacturers to reap the large share of the profit on the sale of the preparation. But the pharmacist who makes his own preparation and also dispenses it upon physicians' prescriptions, not only secures the larger profit of the manufacturers but that of the retailer as well, and at the same time raises himself out of the class of mere merchants.

For the pharmacist to find fault with the physician for prescribing a certain preparation made by a distant house when the pharmacist himself has an equally good home-made one, is extremely poor business policy and for him to undertake to substitute his own make for the one specified in the prescription is not only suicidal from a business point, but may result in placing him in jail. What, then, is the pharmacist to do? The answer is plain: He must try to induce the physician to specify the home-made preparation in the first place, and one way to do this is to call on him in his office, have samples of the article and advertising matter with him, tell him what is in the preparation and suggest reasons for believing that the combination is a good one, and by every means in his power endeavor to make on the physician's mind an impression favorable to the article he has to offer. This is what is meant by "detailing."

Like other forms of advertising, "detailing" is cumulative in its effects. One call on the physician may show no immediate result. A second call may prove disappointing in its effect. By the time a third or fourth call is made, the physician may begin to believe that there is something in the man and in the preparation he is handling. Later calls and a few trials of the medium may convince him that his belief is well founded, and, if the pharmacist keeps up the good work, in time he may enjoy a steady demand for a preparation which yields him both a manufacturer's and a retailer's profit. When this comes about he is on the road to "easy street."

It has been said that good salesmen, like poets, are born, not made. The detail man is a salesman, in that his efforts are to stimulate a demand for the products he represents; thus his work is indirectly the most important part of the selling end of his particular line. I believe, however, that good detail men, like good salesmen, may be made as well as born.

The qualities necessary for good detail work are much the same as for successful salesmanship, namely, honesty, enthusiasm, hard work, knowledge of one's business and the products he represents, absolute confidence in his line and the firm behind it, good health, good appearance, and the ability to keep the tongue well under control. Any of these qualities not a natural possession can be acquired by determined effort.

Honesty is one of the most important elements of success. A detail man is a fool to be otherwise than honest. Absolute fairness and straightforwardness is the only kind of dealing that will get good, permanent results.

Enthusiasm is a very important quality. The detail man should know his line, be sure it is a good one, backed by a reliable concern, then believe in it and the firm to the extent that he can inspire the confidence of the physician in both. He should maintain enthusiasm in his work to the extent that he will not be afraid of working over time. Getting good results should always be the object in view.

Detail work is no easy matter. To get results requires hard mental and physical labor, mental labor being a necessity with those who would cope successfully with the

different kinds of human nature with which the detail man has to come in contact.

Knowledge of the line or preparation is essential, but great care must be used not to reflect on the intelligence of the physician or to consume too much of his time in telling him facts about chemistry and physiological actions that he already knows. Here is where the control of the tongue comes in.

The object of the detail man's visit to the doctor is to call his attention to the merits of a certain preparation, the ethical way in which it is handled, and the reliability of the firm behind it. This should be done briefly and in a courteous manner. The result should be that the caller has so favorably impressed the doctor that he will remember the preparation when writing a prescription long after the caller has gone.

One thing for the detail man to remember is that while he is not expected to send in orders, the sales in his territory depend on his efforts entirely.

The writer's experience in detail work has convinced him that the task of the detail man is much more difficult than that of the ordinary salesman. The salesman endeavors to close his sales on the spot, while the detail man has to depend on the impression he has made to get results—he must overcome the "out of sight out of mind" handicap.

The detail man is the direct representative of the firm to the doctor, and the success of the preparation he is presenting is due almost wholly to his efforts. Hence he must be a high-grade man and should receive the compensation of such. It is hard to understand why a firm that proposes to put out or already has on the market a worthy preparation will intrust such important work to a cheap man, or as is frequently the case, to a foppish young bigot whose real object for taking the job seems to be to travel around and have a good time. The sending out of cheap, ungentlemanly or incompetent men to do detail work has resulted in a rule now very generally found among busy physicians, not to see detail men.

It should be borne in mind by all detail men that sobriety, good appearance and gentlemanly bearing are essential factors in producing desired results.

Discounting Bills.

Among the topics submitted to the members of the Pennsylvania Pharmaceutical Association for discussion at their recent meeting, was this: "Advantages which accrue from discounting all bills."

In a paper on this subject, Franklin M. Apple mentioned some of the advantages which occurred to him. Discounts for prompt payment of bills, he said, are really premiums paid to the retailer by the jobber, and are all profit. The man who did not discount his bills not only failed to receive this premium, but often actually paid the jobber a premium. For corroboration of this statement he referred to any "one of those poor mortals who has been misled into the position of conducting a drug store without sufficient capital to finance it properly, of which class, unfortunately, we have a great superabundance."

Competition in and out of the ranks of his fellows forces the druggist to buy in the lowest possible market, and this market is open only to the man who discounts his bills.

The habit of discounting bills made a merchant more systematic in his business, which was noticed by the public and duly rewarded. Failure to discount had the opposite effect.

Many dealers, retail as well as wholesale, prefer to do a credit business, as credit customers, generally speaking, buy more than they would if they had to pay cash.

Bankers to whom retail merchants apply for loans are more favorably impressed by the man who discounts his bills; so also are mercantile agencies, which frequently rate such men higher than others who have more property but do not discount.

One hundred dollars turned over every ten days at 2 per cent. yields \$73 a year in discounts alone—a very good rate of interest.

The non-discounting merchant imposes a penalty upon himself for procrastination.

The marriage of David S. Schandler, of the Wentworth Drug Company, of Chicago, and Miss Sarah Salem was recently announced.

Function of the Soda Fountain.*

Few popular American inventions are more characteristic of the national genius than the soda fountain. It is practical, it is simple, and it serves a useful purpose. When hot weather comes, the normal physiologic instinct is to drink more freely than at other times. Water is, of course, the standard human beverage; but it is not always easy to get good water, and the human passion for variety craves something with a different flavor. This desire for a new taste was probably at the bottom of the earliest use of alcoholic liquors; the constitutional effects were a secondary affair. There are still those who seek to quench the increased thirst of hot weather with wine or beer. But if alcohol is a bad drink at all times, it is worse when the thermometer is highest. With their innate good sense, therefore, the majority of the American people turned from the bar in quest of harmless and thirst-slaking drink, and the problem of their search was solved by the soda fountain.

The soda fountain bubbles with the versatility of the American character. It contains many possibilities within its limited compass. Originally it was designed merely to dispense aerated water flavored with various fruit extracts. The effervescence and the flavor contributed the two essential elements of a refreshing drink. Gradually, however, new elements were added. The same American genius which had shown itself in the invention of the cocktail, found in the domain of temperance drinks a new field for ingenuity; new mixtures and combinations were devised, until now the nomenclature of the soda fountain is as complex as that of any science. In the first place, there still remains the fundamental category of plain sodas; then there are all these plus ice cream or plus phosphates, or plus an egg or plus any two or three ingredients. The addition of the egg was an important step, for that introduced the element of nutrition. Many a hustling American business man, who would formerly have gulped a whisky raw, followed by a chaser, or would have gone empty, now drinks his egg phosphate, and returns to his business refreshed and to his home good tempered. The soda fountain has helped the morals and the health of the American people.

There are numerous other mixtures with strange names and unfathomed composition—the sundaes and the fizzes and the freezes and so on. Most delectable perhaps is the lime freeze, made of lime juice, mint, ice, and soda water. A perfect substitute for the pernicious and seductive mint julep. It is in the preparation of these mixed drinks that one sees the soda fountain at its best. The decorative stand, the mysterious compartment—from which fluid flows on the pressure of a knob, as Faust's wine flowed from the table—the tinkle of glasses, the cool clink of ice, the fiz of the soda, have all the fascination of a fully equipped bar; and the attendant, in white duck coat and apron, tossing a dash of phosphate into your drink, and then shaking the whole to a foaming mixture, assumes all the friendliness of the bar tender without any of the latter's diabolic possibilities.

To a physician there are, of course, suggested possibilities of evil in the soda fountain, as in all other things. There is the possible transfer of infection by improperly washed glasses; but after all, this risk is little greater than in the average restaurant. There is also the risk of infection from ice cream; but this risk, too, is present elsewhere, and the prudent may abstain therefrom. In the main, the soda fountain has few objectionable qualities, and these are far outweighed by its merits. It is clean, it is wholesome, it is attractive. It combines cheapness and convenience with estheticism in its ministrations to human thirst. It is perennial, for it can dispense a whole new category of hot drinks in winter. It is a great, civilizing agent, a triumphant manifestation of clear-headed, practical American genius.

In dismissing the case against Jacob Dultz, of Newark, N. J., in which the defendant was charged with illegally refilling a registered bottle, the municipal judge, before whom it was tried, said that the evidence did not show a violation of the intent of the law because the druggist had merely put carbolyzed water in a bottle brought in by an agent of the mineral water company owning the bottle in question.

* Editorial in the Boston Medical and Surgical Journal.

No Store Better than Its Clerks.*

By C. A. C.

Are you an ordinary clerk; or a "live-wire clerk?" The ordinary clerk is in a rut—a rut as deep as the grave; he's buried in habits—routine, prejudices, petty jealousies, ignorance of the goods, and a score of other ills. The "live-wire clerk" is the one who doesn't know it all! In fact, he admits that there are lots of things which he is not familiar with—but he wants to learn, and he is always learning. He keeps both eyes open for the main chance, and when it comes he's the one that seizes it, or is seized by it, while the ordinary clerk wonders why the live one is "so lucky."

No amount of advertising, no matter how good, will give a store a better reputation than that given it by those who work behind its counters. Did the customers you served to-day leave the store with a better or a worse impression of the store in which you work? To make good first impressions is important, for they're generally lasting impressions.

When a customer is permitted to stand around for five minutes before anyone speaks to him he becomes justly irritated and leaves the store with a bad impression.

Several weeks ago while in Kansas City I saw in the local office of the Postal Telegraph Company, the heading, "The Employee Is the Company" on the card shown herewith. I read the rest of it, and you will, too. It struck me as being one of the strongest sermons on service that I had ever seen—and I resolved to show it to you. Now re-read it—study it and apply it to yourself; it's worth while.

THE EMPLOYEE IS THE COMPANY.

It is a fact that the public regards the representatives it meets and with whom it transacts business as the company itself. We know this from our personal experience in stores, for instance. If we are well treated by the clerks, if they are pleasant and affable, if they impress us by their alertness and their knowledge of their business, our trade naturally gravitates toward that store. We like to go there; we are glad to tell our friends about it and to influence their patronage in that direction.

So it is with the representatives of the Postal Telegraph. The public receives its idea of the company largely through you. You are the ones they meet and from whom, as a rule, they form their impression of the company itself. Hence, it behooves all to be efficient, alert, honest and obliging, since in so doing we not only build character for ourselves, but we likewise give character and reputation to the company we serve.

Edward J. Nally,
Vice-President and General Manager.

Take a mental note of your clerk acquaintances, especially the older ones. Size them up. How many of them are "satisfied"; and how many are endeavoring to climb upward to a position where they can give their families and themselves a better living and at the same time be of better service to their employer and the world?

If you're in a rut—climb out. If you're out, stay out.

You want greater business-building, money-making, result-producing ability. How are you going to get it? The answer comes in one word—study. Not books, but yourself. What are your weak points? Reinforce them.

A New York business man, a shrewd one, too, and a big advertiser, once said, "Give me, every time, the clerk who watches my ads." There's a hint for the clerk who wonders why he doesn't forge ahead.

Study your employer's advertising—and his competitor's advertising.

Study also all the printed matter that comes from the manufacturer—you'll get valuable hints from it all, and it will help you to know the goods. You can't sell goods without knowing something about them; and you'll never know so much about them that you can't get new ideas about them from other people. Read all the trade papers that come into your store; you yourself ought to be a subscriber to several, one at least for each line of goods that you sell. It has been said that a clerk, or dealer, who "hasn't time to read trade journals" is like a preacher without a Bible, concordance and commentaries. A lawyer without a library or the regular issued reports of recent cases is a better simile, for new "cases," new situations and new methods are always developing in business; and they're reported in the trade journals.

The store and the clerk must be cleanly and attractive. Dirty windows and showcases, a litter of boxes, etc., are repelling. So is a dirty collar, filthy apron, soiled shirt,

unpolished shoes and an unkempt face. But nobody ever saw a clean store with slovenly clerks, or neat clerks and an ill-kept store.

A clean store with clean clerks is the place where business goes—whether it's a paint store or a jewelry shop.

Be enthusiastic. Enthusiasm is the torch-flame that melts obstacles.

The man who coaches the chorus for the popular musical comedies is always emphasizing upon his pupils the potency of the smile. He tells them to smile. He tells them to show their teeth. You, too, must smile; there's no argument equal to a happy smile. But while being cheerful and courteous, be not over-cordial. A clerk can be so delightfully entertaining that he'll have half the town hanging around his employer's store—but probably the other half, who buy the goods, are succumbing to the careful courtesy and the sincere smile of some serious salesman. Be enthusiastic, courteous, smiling and yet "all business."

When a patron enters, greet him. Never serve a customer with your hat on, if you're inside, and never with a cigar in your mouth. If everybody is busy acknowledge his entrance with a smile and some pleasant assurance that he will be waited on soon. He will generally await your convenience, once his own good nature is thus secured.

Confidence in the goods is of supreme importance in your sales talk. You or your employer can sell an inferior or "wrong purpose," or substitute can of paint or varnish to one man once, but if he is misled it's mighty hard to sell that man anything—good or bad—thereafter. Sell your goods in such a way that you will gain confidence in yourself and from the public. Have confidence in whatever goods you recommend. If you get a complaint never say "That's impossible"; instead, take time to investigate the case, and be courteous about it.

The Marshall Field clerks are instructed always to make the customer feel that probably he is right; then they investigate.

Sir Thomas Lipton gives this advice: "To the young men who are filled with aspirations towards success in business may I here say a few words of advice? Always beware of strong drink. Remember cork screws have sunk more people than cork packets will ever save. Always be civil. Try to treat rich and poor alike. Is not the poor man's twenty shillings as good as a rich man's pound? The workingman's wife with her basket on her arm is entitled to as much respect as the lady who comes in a carriage."

And don't forget the value of time. You can't loaf on the job fifteen minutes to-day, and say "I'll make it up to-morrow." At the close of to-day, to-day is gone—lost forever; and "to-morrow never comes."

Your aim should not be so much what you get, as what you do for what you get; and your employer will be glad to help you do more and do it better. Get busy, spruce up, get going, be ambitious. The only really unhappy people on this earth, rich or poor, are those who are willing to "stand still" instead of keeping up with the procession—those who are forging forward toward the band are the happiest of all, happier even than when they get in the wagon, for the ambitious youngsters make their seats precarious. Playing the game is the real fun; and he who plays it hard and fair is the one who gets the really good things out of life.

At the request of Dr. J. S. Crumbine, secretary of the Kansas Board of Health, the State attorney-general recently ordered the arrest of a man at Hutchinson if this man attempted to use his "mad-stone" in an effort to cure persons bitten by a dog.

The city solicitor of Omaha, Neb., has advised the municipal police that druggists may not sell malt liquors, apparently including extract of malt, under their liquor permits.

The San Joaquin Drug Store, W. H. Pring, manager, of Stockton, Cal., distributes as advertising picture postcards depicting the various departments of the store.

De Baun VanAken, of Amsterdam, N. Y., has been elected president of the merchant's association recently organized by the merchants of that town.

The newspapers have it that an Asheville, N. C., drug store was obliged to close its doors recently because the employees went on a strike.

* From the Paint and Oil Dealer.

Profitableness of Hot Soda.

Some Figures of Small Cost and Large Returns—
Hunger and Thirst Both Call for Hot Drinks—
Hot Soda Is Easy to Make and Serve.

BY AN OLD HAND AT THE BUSINESS.

Viewed from the standpoint of the man who wishes to make the most money from the smallest investment, the hot-soda business is an attractive proposition. At the outside, he could not possibly spend over one-tenth as much for his hot-soda equipment as he would spend for a soda fountain that would bring the same amount of business daily.

Single urns for heating water only may be bought for from \$5 to \$8. Two-compartment urns, holding 2 to 5 gallons of coffee or cocoa and 4 to 8 gallons of water cost from \$20 to \$30. And urns with three such compartments are to be had at from \$3 to \$5 more, the big twin urns costing in the neighborhood of \$50. The buyer has the option of using gas or gasoline, as makers will equip urns with the burner required for either fuel.

SOME FIGURES.

Dutch-process cocoa can be bought for 28 cents a pound in 100 pound lots. A pound of this cocoa powder will make two gallons of hot-soda syrup when combined with sugar-syrup costing about 35 cents a gallon. That is, the 2 gallons of cocoa syrup, enough for from 120 to 150 cups of hot cocoa cost about \$1. Including cocoa, sugar, a couple of wafers, and a paper napkin the finished drink can be served at a cost of 1½ cents a cup. Milk cocoa made with a syrup containing 6 ounces of powdered cocoa to the gallon—1 ounce of syrup to the cup—costs less than 1 cent a cup.

Of the food drinks those made from beef extracts are probably the most popular. And the profits on the beef beverages are exceedingly large. Nearly all the beef extracts are used in the proportion of a teaspoonful to a cup. In other words, ½ ounce of beef extract makes one cup of bouillon, or, in theory, 128 cups to the pound, the pound of bouillon costing in the neighborhood of one dollar or less, according to the quantity bought. No cream or sugar has to be added to these drinks. As there is more or less loss in the serving of any liquid extract, dispensers everywhere take kindly to the beef bouillon cubes, because they know that when they buy 100 cubes, they are buying the raw material for 100 cups of bouillon. These cubes cost something less than \$2 a hundred, according to quantity.

Tomato bouillon is a more expensive drink, costing between 4 and 5 cents for the finished cup, and must be sold at 10 cents to make an adequate profit.

Clam drinks are also expensive because of the high cost of the extract. Generally speaking, it costs 3½ to 4 cents to make a cup of clam, or malted clam, bouillon; but if well made with good juice and fresh butter there is no trouble to get 10 cents a cup for it. Plain clam broth, or clam tea, as some call it, can be made at a cost of 3 cents a cup.

Of the popular hot beverages, the malted milk drinks are the most expensive. A fact which many dispensers seemingly overlook is that malted milk is an expensive product. It takes about 1 ounce of the malted milk powder costing 4 cents, and ½ ounce of cream costing about ¼ cent to make a glass of malted milk, which is sold at 10 cents. For a one-egg plain malted milk the cost is from 2 to 5 cents higher; and a malted milk egg chocolate will cost from 8 to 12 cents a glass. There certainly is no profit in selling the egg-malted-milk drinks for less than 15 cents.

Now and then a customer is met who wants ice cream in a hot drink, but this is only a fad and a not extensive one. In general the ice cream bill at the hot drink fountain is nil. Customers who will pay 10 cents for ice cream soda are usually willing to pay 10 cents for a hot drink; while the man who must, or thinks he must, serve ice cream soda water at 5 cents a glass, cannot get any more for hot drinks. But, at that the cost of the other ingredients that go into ice cream soda is as much as the entire cost of the hot beverage.

OPERATING EXPENSES.

Gas or gasoline costing from 75 cents to \$1.50 a month will furnish all the heat that is necessary for a good sized hot soda outfit. It probably costs the average hot soda dispenser not to exceed \$1 a month for fuel. Compare this

with the price of the ice required in operating a soda fountain that will do the same amount of cash business. Comparisons may be odious; but in this case there is a reason that is obvious.

Also, because the serving of a hot drink does not require the talented chemist-chef of the fancy summer drink counter, there is considerable saving in the cost of attendants. It is a simple matter to put a teaspoonful of extract or a beef bouillon cube in a cup and to draw hot water in it. Take it the day through, one dispenser will serve one-third to one-half more people with hot drinks in a given time than he can supply with cold drinks. Far less labor is required to keep the urns, silverware and chinaware clean than is necessary to keep a soda fountain tidy and the glassware spotlessly clean. The cold soda menu contains from fifty to a hundred items; a hot drink menu, not over ten or a dozen, so that there is not nearly the investment tied up in supplies.

But my desire is not so much to show the advantages of hot drinks over cold drinks as to demonstrate to the readers of the CIRCULAR that the two go hand in hand, that each helps the other, and that both are profitable. That the hot drink is a little less costly and a little more profitable, is no argument against cold soda water; but simply a proof that it is folly for any man to close down his fountain in winter, when a public thirst exists that is a golden opportunity entailing little effort or expense in the grasping.

As I said last month, the way to make the most money is to give the public its choice of hot or cold beverage, for no matter what the outdoor temperature, there are those—and they pass your door—who want hot drinks and those who want ice cream sodas on the same day. Side by side the hot soda and the cold soda will more than double the earnings of either alone.

Is Coca-Cola a Habit-Forming Drink?

According to the *National Bottlers' Gazette*, the following press dispatch from Gainesville, Fla., was recently published in the *Times-Union*, of Jacksonville:

Gainesville, June 2.—There have been, from time to time since the creation of this old world, famines of various kinds—water famines, ice famines, grain famines, and scores of others; but it falls to the lot of Gainesville to introduce the most unique famine ever—a coca-cola famine, and for the past two days not a drop of this beverage could be secured in the city, due to the fact that the railroads have probably carried the shipment due here to Gainesville, Ga., Gainesville, Tex., or some other Gainesville, for it has not shown up here, and as a result the town is wild—at least, that portion of it that is addicted to the use of this beverage, or whatever it may be termed.

Talk about the ravages of the fellow who likes his toddy and "runs in" to a dry town. Why, apparently, this fellow's trouble is nothing compared to those which haunt the fellow who must do without the black beverage which has made Atlanta famous. These coca-cola inebriates are easily identified by the eager manner in which they have sought the cold drink stands and pleaded with dispensers for "just a spoonful" of the essence if they had it. They are praying for every train to bring relief to the situation—and in the meantime the fellow who "gets his" from joyous jax has the laugh on the less fortunate. If something is not done soon it is anticipated that a coca-cola train will also be put on from the State's metropolis."

Pineapple Perfection.

He first squeezed the juice of half a lemon in the shaker glass, then he added about 2 ounces of crushed pineapple, a handful of cracked ice and one egg. This he shook up well, ran carbonated water into the shaker, tossed it back and forth a couple of times and strained into a serving glass. A little nutmeg on top and a couple of straws finished the drink, and he set it down in front of the Boss.

After a few sips the Boss remarked:

"That's fine, Jack, what is it?"

"Pineapple perfection, Mr. Jenkins."

"Well, it's sure good, get it on the next menu, Jack."—*Confectioners' Journal*.

The Indiana Board of Health has notified druggists, confectioners, and soda water vendors that, if they serve any syrup, crushed fruit, or ice cream prepared with an artificial color a notice to that effect must be posted in a conspicuous place in their place of business.

White coats are worn by soda dispensers in order that customers may see for themselves that the coats are clean; not, as seems to be supposed by some who wear them, to emphasize the spots of dirt which they bear.

Cold Soda at Hot Springs.

A soda fountain maintained at a high standard of service is one of the drug store's most valuable advertisements and drawing cards, in the opinion of F. P. Walker, president of the Sorrells Drug Company, Hot Springs, Ark., and he has found this form of advertisement especially creative of demand for the higher grades of sundries and toilet goods. The "high standard" is obtained directly through looking out for three things, cleanliness, quality, and service, and of these three, each one is of so much importance, says Mr. Walker, that no one takes precedence over the other.

"An unpretentious soda fountain plant can be made a popular one by having the fountain bright and shining," according to Mr. Walker, "while the very finest plant can be made uninviting by the presence of dust, dirt or dull finishings; high quality of goods is of necessity a factor; and without proper service the two already mentioned are at a disadvantage."

Continuing, Mr. Walker said: "The highest salaries are earned only by those who give their customers prompt and courteous service—and courtesy is so important that it should be given preference over an expert at the counter."

Sorrells' Hot Springs Fountain Which Mr. Walker Supervises.

"Our method of soda advertising is a simple announcement in the daily papers twice a year as to who has charge of our fountain for the season, and by the use of home-made white strips of paper 4 by 24 inches pasted on our windows as 'readers'—a new 'special' of moderate price is gotten out daily, and we have found that this new 'daily' will bring trade from beyond other fountains."

A close inspection of the picture of the Sorrells Drug Company's fountain herewith shown will discover two glass signs advising readers that soda checks are given, and must be paid at the cigar counter—that deposits must be made on all glasses taken out, which, upon the return of the glass, will be promptly refunded. Mr. Walker has observed that paying checks at the cigar counter or candy case will double the sales in this department, and the requiring of a deposit on glasses taken out has obvious merits.

A customer once volunteered the remark in the Sorrells store that somehow he had always walked many blocks out of his way to drink there and had just found out that it was because the glasses on the counter there were always dry and polished. It had never occurred to him that a part of the good taste of soda water was in the appearance of the surroundings and the knowledge that cleanliness prevailed.

A Dozen Eggs.

Eggs—fresh eggs—that is to say, strictly fresh eggs—are useful things about a fountain. Some of their uses are indicated in the following formulas which have been gathered from various sources:

Peach Flip.

Peach syrup, 2 ounces; egg, 1. Shake, fill glass, and serve a slice of fresh peach.

Cream Flip.

Vanilla syrup, 1 ounce; fresh cream, 1 ounce; egg, 1; essence of cinnamon, a drop. Shake, fill glass, and add a little grated cinnamon or nutmeg.

Lime Flip.

Lemon syrup, 1½ ounces; lime juice, ½ ounce; egg, 1; cracked ice, enough. Shake and fill the glass with carbonated water. If juice from the fresh lime fruit is used, serve with a bit of lime peel; if the bottled juice is used, a slice of lemon makes a suitable trim.

Prairie Oyster.

Carbonated water, 2 ounces; egg, 1; juice of ½ lemon; pepper and salt, enough. Shake well and serve with a mineral glass of carbonated water on the side.

Egyptian Flip.

Ginger syrup, 1½ ounces; solution of acid phosphates, a few dashes; egg, 1; cracked ice, enough. Shake well, fill the glass with carbonated water, and serve with a cube of pineapple.

Egg Straight.

Prepare a glass of sarsaparilla soda without foam, and into this open an egg without breaking the yolk.

Admiral Frappe.

Tincture of ginger, 2 drams; cream, 4 ounces; eggs, 2; strawberry syrup, 12 ounces. Mix well and trim with whole strawberries.

Dewey Flip.

Lemon syrup, 2 ounces; essence of peppermint, a dash; egg, 1. Mix well, fill the glass with carbonated water, and serve with a bit of lemon peel and a sprig of fresh mint.

That Drink.

Raspberry syrup, 1 ounce; orange syrup, 1 ounce; plain cream, 1 ounce; egg, 1; ice, enough. Shake, fill the glass with carbonated water, and garnish with a slice of orange.

Grape and Egg.

Grape juice, 1 ounce; powdered sugar, a teaspoonful; egg, 1; cracked ice, a plenty. Shake well, fill the glass with milk, shake again, and serve with a little nutmeg grated on top.

Lemon Scotch.

Fresh juice from 1 lemon; powdered sugar, a tablespoonful; egg, 1; cracked ice, a plenty. Shake and strain. Fill glass with ginger-ale, and serve with a slice of lemon.

Serving Egg Drinks.

Some general directions for serving egg drinks come in appropriately just here, so a few paragraphs from the *Confectioners' Journal* follow:

The first requirement for an egg drink is a good, fresh egg broken in the glass before the customer. Anybody can break an egg, but to do it neatly and nicely is another thing. There is a knack about it which can be acquired with a little practice. Hold the glass in your left hand and the egg in your right hand and bring the edge of the

glass and the center of the egg-shell quickly and sharply together with one blow sufficiently to cut through (not just crack) the shell and the inner white skin. You can now bring the egg quickly over the glass, setting it on the counter, and drop out the egg. If you crack the egg on the glass when it sets on the counter some of the egg is liable to run on the outside. If the egg is gradually broken it will not separate so readily. After you catch the idea you can easily drop the egg into the glass from one hand. It is all done so quickly and so easily that any one watching you will wonder how you can do it.

Now the egg should be thoroughly broken apart or beaten. This can be done by dropping in a few pieces of fine ice; then draw on the syrup and shake it up. Set the glass on the counter and place an ordinary lemonade shaker over it, pressing it down a little to one side firmly. Now lift the glass with the left hand, hold the shaker with the right, and invert them so that the shaker will now remain at the bottom. Hold the glass firmly into the shaker with your thumb pressing onto the bottom; and hold the shaker with your right thumb and first two fingers grasping around it and the two other fingers pressing on the bottom. Now shake the egg up and down vigorously with a movement of the arms from the elbow, holding the shaker and glass in front of you. The egg will be thoroughly broken in five seconds. Set the shaker on the counter and remove the glass. Draw the soda into the shaker, using both the fine and coarse streams. Pour the drink back and forth two or three times, drawing it out into a stream, and finish by straining the drink into the glass, using a wire strainer. The above method can be easily and quickly learned.

Egg drinks should be advertised with window stickers and signs, the same as ice-cream soda or other drinks, and you can work up a profitable trade on them in a short time. It is a good plan to keep a supply of fresh eggs in a glass bowl on the counter, or where they can be seen by patrons. Some prefer to take their drink through straws, and these should be kept handy for use when asked for. A small shaker containing ground nutmeg should be kept to sprinkle the tops of the drinks. The drink should be thoroughly cold.

Soda Fountain Perils.*

By DR. HARVEY W. WILEY.

Soda itself is all right, but dangerous ingredients are likely to be hidden in the foam-covered glasses.

The honest soda-water man who sells real soda water is a godsend. I would not part with him for the world. It's the man who sells injurious chemicals and habit-producing drugs in soda-water glasses to whom I am opposed, and whom I would like to see driven out of business.

To be pure and healthy, soda water should contain three ingredients—pure fruit flavors, pure carbonated water, and sugar, not saccharin or some other injurious sweetening.

To sell flavors that are made of chemicals instead of fruits is criminal.

To begin with, what is soda water? That is one question I would like to have congress and the various State legislatures define positively. Until there is some authoritative action taken on the question, there is little reason to believe that we will ever get pure, clean soda water in the ordinary drug store.

There is no law which compels the druggist to put specified ingredients into his concoction. He may put virtually anything under the sun except the poisons which are prohibited by law into a glass and squirt a little foam on top, and, if the mixture is satisfying to the palate, or the credulous, he will make money. Some day, I hope, congress will tell us what soda water is, and what it is not.

First of all, soda water does not, and is not supposed to, contain any soda. The name is a misnomer. A great deal of the stuff that is sold under the name of soda water contains saccharin instead of sugar. That should be prohibited by law. Saccharin is injurious to every one, and affects children seriously.

I could not venture an opinion on the yearly number of little children whose lives are ruined by the use of caffeine and other "dopes" which are hidden in soda-water glasses.

The dispenser who can not or does not keep his white coat clean for a day, should change twice a day.

* From an interview with Dr. Wiley in the Evening Post.

"Cures."

"What is a cure?" asks M. M. Osborne, of Elkins Park, Pa., in the August issue of his store paper. Then he goes on to answer his own query as follows:

One answer might be—and it now practically has government sanction—that anything anyone chooses to put out as a "cure" for anything, "goes" legally! The supreme court of the United States has rendered, in a "cancer-cure" case, the decision that the pure food and drugs law does not apply to mis-statements of the label as to curative properties, but only as to contents!

The foul birds of prey in human form may now laugh at their opponents and foist any fraudulent stuff they please on that considerable portion of the public that likes to be fooled. It is strange how many who are pronounced incurable by experts, will flock to these wretches, who do not know cancer from a cold in the head, and take their "cures" by the pint. But they will not laugh long, for President Taft has sent an emergency message to congress calling on it to remove "an evil which menaces the general health of the people and strikes at the life of the nation." A New York publication says "the people are becoming more enlightened and are no longer to be deceived by the cruel lies in 'patent' medicine almanacs."

There are no real "cures." Even the comparatively few medicines that scientific men look on as almost "specifics" in certain cases are only "helps to nature." We favor common sense, the giving of remedies, when diagnosis indicates them, to aid nature. No "fake" has or ever did have our support. Ours is a pharmacy, not a mere drug store.

Striving to Please.

On the wrapping paper of a store in a small Southern city the following is printed:

WE WERE PLEASED

to be favored with your patronage to-day, and we trust that everything you bought of us will prove satisfactory in every respect. If for any reason you are not satisfied with your purchase, we ask that you report the matter to us at once, that it may be adjusted to your entire satisfaction.

We want your trade, and shall try to serve you well.

CALL AGAIN.

There seems to be no copyright on the legend, and it might not be a bad idea for others to use it.

To hold the old customers, get out after the new.—Elbert Hubbard.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER 10.

NEW YORK, OCTOBER, 1911.

WHOLE NUMBER 658.

The 1911 Meeting of the N. A. R. D.

To the student of Homer it is quite patent that the Hellenic warriors owed their success not the least to the high regard each had for himself, to their magnificent conceit. So it is to-day: the men that succeed are those who believe that success is theirs to command. And, looking back upon the recent meeting of the National Association of Retail Druggists, one is struck with the lack of manifestation of this belief on the part of the officers and delegates assembled at Niagara Falls with respect to certain important measures which came before them for consideration. Truly was it said by two speakers on the floor of the convention, one a manufacturer, the other a retail druggist, that if the association got behind a practicable stable plan of price-protection and let its will be known in no uncertain terms, the end of price-cutting was in sight. These two men showed belief in the power of the organization, a well founded belief, and one that it is to be hoped will guide the officers of the association during the coming year, not only in an endeavor to secure a living profit on a line of goods that for the present druggists seemingly must handle, willy-nilly, but in spreading the propaganda of non-secrecy in medicine, and in procuring legislation desired by all drugdom.

It must not be inferred, however, that a disposition to procrastinate or to adopt a middle-ground policy marked the entire proceedings. There was a commendable inclination to meet the medical profession half way and with clean hands in a united effort to uplift the bipartite vocation of healing. In continuing its propagandic work and in the stand taken in regard to the refilling of prescriptions the association has indicated a willingness to do a just part by the physician, the pharmacist, and the patient. It is to be regretted that there was not a greater interest in the meeting of the propaganda committee. However, it may be that the present plan of carrying on the work is so satisfactory and so thoroughly understood as to render discussion unnecessary.

Due recognition was given to the fact that the national association can be of tangible assistance to its members and the retail drug trade at large, in the resolution instructing the executive committee to investigate co-operative business ventures, and in the plan to have the national headquarters act as a clearing house for full-price coupons. That the direct usefulness of the organization is becoming better known was shown in the report of the legal depart-

ment relative to the calls for assistance sent in from State and local associations and individual druggists during the year. When it becomes better known to the retail druggists of the country that the national association can be of assistance to each and every one of them, and the national association recognizes how much assistance it really can extend, there will dawn a better era for both parties.

Perhaps it was because no immediate need for convincing action offered, that the convention contented itself with suggestions rather than demands in some other things. In the matter of price-protection—which by-the-bye got almost the lion's share of attention—action as immediate as possible was insisted upon by the delegates despite the inclination of the committee on resolutions to procrastinate. A little more of the do-it-and-do-it-now serum might well have been injected into the tenor of the resolutions, with a healthy result to the future of the organization. For instance:

A matter of the utmost importance to every dispenser of prescribed medicines, the reform of our patent laws, got but scanty recognition in the report of the committee on national legislation, was not discussed on the floor of the convention, and was disposed of by the committee on resolutions in the vague phraseology of the 1910 convention: "Resolved that the patent laws be amended," etc. "Resolved"; by what authority? "Amended"; by whom? How much more convincing it would have been had the committee on legislation been instructed to draft a satisfactory amendment to the law, and to call upon every retail druggist in these United States to make a demand on his senators and representative in congress for reciprocity in letters patent, to demand that congress strike off that made-in-Germany yoke, that involuntary promise to "wholly abstain from questioning or contesting the validity of" patents on medicinal substances.

And again: in the matter of saloons disguised as drug stores in "prohibition" territory—there is an evil that cannot be winked at, an evil not a part of pharmacy but bringing upon the calling the deepest reproach. Surely a resolution purposed to clean the skirts of the legitimate drug business deserved better than tabling.

Starting off with a seasoned executive board, and well charted with suggestions and recommendations, the association should make the ensuing year one of record-breaking accomplishments. The power is

there; the men are there; let it be hoped that the will is there also. All within the ranks is harmony, if one may judge by the Niagara Falls meeting; the drug world awaits with interest and hope what the year will bring forth.

Dr. Wiley Vindicated by the President.

Those who have read the papers much of late must have noticed accounts of private investigations of United States Judge Grosscup's history, including the manner in which he has acquired such property as he owns. It seems that it is quite the style nowadays for large "interests" which may be affected by the actions or decisions of an individual, to put private detectives, secret service men, lawyers and others on the track of that individual for the purpose of finding something in his record that may be used to discredit him. These investigations, of course, take time.

After a delay of many weeks President Taft, just before starting on a speech-making tour of the country about the middle of last month, gave his decision in the Wiley-Rusby case, which was in the form of a letter to Secretary Wilson. In doing this he stated that he had reached this decision several weeks previously, but had delayed making it public on account of the investigation into the same matter by a congressional committee that had been under way.

It will be remembered that charges were brought by the committee on personnel of the department of agriculture against Dr. H. W. Wiley, chief of the bureau of chemistry; Dr. W. D. Bigelow, assistant chief; Dr. L. F. Kebler, chief of the drug laboratory; and Dr. H. H. Rusby, pharmacognosist, based upon alleged irregularities in the appointment of Dr. Rusby to his position in the government service; and that an additional charge was brought against Dr. Rusby for alleged irregularity in his recommendation for appointment of Dr. William Mansfield as an unskilled laborer in the service of the bureau. The nub of these charges as expressed by President Taft himself, was that Dr. Wiley, Dr. Bigelow, Dr. Kebler, and Dr. Rusby in effect conspired to put on the record a contract for a general employment of Dr. Rusby's services for one thousand six hundred dollars a year, but actually and secretly made a contract with him, by which he was to do only enough work during the year for the one thousand six hundred dollars to secure to him a compensation of twenty dollars a day, and that this was done in deliberate and defiant violation of the law as interpreted by the attorney-general in an opinion in which he held that congress had limited the compensation of experts to nine dollars a day. The committee making these charges recommended that Drs. Wiley and Bigelow "be given an opportunity to resign," that Dr. Kebler be reduced to a position in which he would have no authority to make recommendations regarding the salaries or periods of service of other employees of the bureau, and that Dr. Rusby be dismissed from the service. The recommendations went first to the executive head of the de-

partment of agriculture, Secretary Wilson, who passed them along to President Taft, who, in turn, referred them to his legal adviser, Attorney-General Wickersham for his opinion as a lawyer. In giving this opinion, in which he recommended that the president approve the recommendations of the committee on personnel, the attorney-general went so far as to say that "such an agreement [as was set forth in the committee's report] certainly merits condign punishment." President Taft next sent the papers in the case to Secretary Wilson, directing him to submit a report on the situation. The secretary did this, as long ago as July, recommending that Dr. Wiley be admonished but not dismissed. From that time until his decision, made public September fifteenth, the matter rested in President's Taft's hands.

Much to the satisfaction of those who believe that the food and drugs act is a good thing for the public and that it should be honestly enforced, the president not only exonerated Dr. Wiley from all charges, but said that "one can not withhold one's sympathy with an earnest effort by Dr. Wiley to pay proper compensation and secure expert assistance in the enforcement of so important a statute, certainly in the beginning when the questions arising under it are of capital importance to the public." The president found that there was no evidence that Dr. Wiley was a party to the correspondence on which the charges were based, and that he was justified by precedents in the department for doing what he did.

President Taft's acquittal of Dr. Rusby, in so far as his own employment as pharmacognosist is concerned, was as thorough as was that of Dr. Wiley. "So far as Dr. Rusby is concerned with respect to this particular contract," said he, "I do not find him at fault." Then he added: "For purposes of punishment or dismissal, I cannot charge him with knowledge of the legal difficulties involved in his employment." Regarding the Mansfield matter the president said:

There is another charge against Dr. Rusby for securing appointment, on the common laborers' roll, of a physician and expert whom he could use to do his work at a very small stipend when he himself was called away in other employment. I regret to say that the arrangement which Dr. Rusby thus made is not especially creditable to him, and shakes in some degree one's confidence in his avowed wish to make personal pecuniary sacrifice in the public interest for the enforcement of the pure food law. But Dr. Rusby's position as an expert of high skill and standing is such that I do not think that any more than this expression of opinion should be imposed as penalty. My information is that the government needs his services and that he has already rendered valuable aid. The error referred to, committed by him, should not call for further action or remark.

When the president so expressed himself he evidently was unaware of the fact that Dr. Rusby had been employing Dr. Mansfield to assist him in his work and paying him for such assistance out of his own pocket at a higher rate than he himself was receiving from the government for the same work. On occasions when Dr. Rusby was called away from New York, as, for instance, when the government

sent him to distant cities to appear as a witness in trials growing out of the food and drugs act, the work of passing shipments of drugs received at this port would have been so much delayed that the government stores would have been inadequate to hold the goods, and the importers would have sustained much inconvenience and loss of trade if there had been no drug expert to do some of his work. To prevent such delay, with its attendant train of evils, Dr. Rusby had employed Dr. Mansfield at his own expense to do some of the work, and as the salary which he (Dr. Rusby) was receiving was small, he asked the chief of the drug bureau at Washington if it would be proper to have Dr. Mansfield put on the payroll at a laborer's salary of fifty dollars a month. That wage would have been adequate pay for the amount of Dr. Mansfield's time that the work required, and it is hard to see how Dr. Rusby's attitude in the matter is "not especially creditable to him," unless the discredit is made to extend to the employment by the government of experts of the Rusby type for one thousand six hundred dollars a year, and of the Remsen type for two thousand. Dr. Mansfield's appointment was not secured.

Dr. Bigelow and Dr. Kebler, the president found, were over-zealous and disingenuous in the matter of securing Dr. Rusby's services, for which they should be reprimanded. This was the most severe thing he said about any of the men under charges.

In his letter our chief magistrate intimates that the decision in the case immediately under consideration was a small matter compared with other work which awaits him in the department of agriculture. That the entire department needs as herculean treatment as did the Augean stables, those who have followed the Wiley-Rusby matter with any degree of care are painfully aware. That the charges against Dr. Wiley and the others were what is commonly spoken of as a "cooked up" affair there is small room for doubt, and all signs point to one of his fellow officers in the department as the chef. That this affair was the culmination of a long continued and bitterly waged attack upon the forces in the department of agriculture which are exerted in the interests of the people and against the interests of those who exploit the people can hardly be seriously denied. That the decision to retain Dr. Wiley in office is a wise and correct one we believe all lovers of justice will admit, and that it is a severe blow to those who have been plotting for his downfall is apparent.

President Taft and the public are both to be congratulated upon the president's backing up of Dr. Wiley and his strong and much-needed support of the food and drugs act. Especially does the CIRCULAR feel gratified at that portion of the president's letter in which he clears Dr. Rusby of the charge of aiding in or conniving at an attempt to get an illegal salary for work done by him for the government. That Dr. Rusby is incapable of doing a low, mean, tricky or underhand thing those who know him best feel most assured, and for him to have gone down in defeat before an assault by the forces

of darkness would have meant discouragement for those who fight for the right because it is the right—despair, perhaps, for some of them who are disposed to be faint-hearted.

One Thousand Notices of Judgment.

Under date of August fifteenth the secretary of agriculture has issued notice of judgment number one thousand, given pursuant to section four of the food and drugs act. This means that since the act became effective a few months less than five years ago, one thousand alleged offenders against its provisions have been haled to court, the charges against them in all but a few cases having been sustained. When we take into consideration the fact that the law is but little more than an official mandate that the label on food and drug packages be made truthful, and that the almost one thousand convictions secured under it were in cases in which mendacity had been persisted in despite the law, we are led to wonder how much of untruth would have been proclaimed from such labels if there had been no wide-spread and well-directed effort to suppress it. We are also excusable for suspecting that much of this kind of untruthfulness (not to use the shorter and less euphonious word) is now going on around us simply because the officers have as yet not been able to take cognizance of it. And when we examine some of these judgments, consider the motives which lay behind the misdemeanors therein recorded, and reflect that the principal sufferers at the hands of the misdemeanants were the sick, the weak, the debilitated, helpless young babies and enfeebled old men and women, not only are we shocked at this evidence of the depravity to which seemingly intelligent citizens, who presumably claim to be more or less respectable, can descend, but we wonder how anyone who cares so much as a tinker's imprecation for the welfare of his fellow beings can argue against the desirability of the food and drugs act, or raise his hand in an effort to stop a movement to make it broader and more drastic.

Notice of judgment number one was issued May second, 1908, more than a year having elapsed after the coming into effect of the food and drugs law before the officials began to bring suit under it; and since August fifteenth, when the one-thousandth such notice was published, a number of others have been given out, so that to intimate that only one thousand judgments have been recorded under this law in four years and nine months is not to give the department of agriculture full credit for its activity. Leaving out of consideration such suits as were based upon the adulteration or misbranding of foods, we find among the others a great deal to interest and instruct us. The first of these is notice number ten, and deals with a sale of cocaine hydrochloride by a man doing business in the District of Columbia. A plea of guilty was entered and a fine of one thousand dollars was imposed. This case is mentioned in the CIRCULAR for July, 1908, page 335, and abstracts of such judgments as pertain more especially to drugs obtained under the law have been given in this journal from time to time.

as they have been issued. It is not our intention here to go into the details of these cases again, but merely to call attention to them in a general way in order that the value to druggists and the public of the act may be emphasized.

The first nostrum to be shown up in a notice of judgment was "sartoin skin food." It was proven by analysis that this "skin food," for external application, was simply epsom salt, dyed pink. Here again a plea of guilty was entered, the fine imposed being ten dollars. The next notice of judgment in a medicine case is number twenty-five and refers to the Harper's cuforhedake case. This was a cause celebre and was treated at length in certain issues of the CIRCULAR published in 1908. A strong defense before a jury was made by the defendant, but he lost and was fined seven hundred dollars. Notice of appeal was served, but the case was not taken to a higher court, the defendant paying the fine. A case which did go to a higher court, however, was one in which the labeling of a drug so as to indicate that it was a cure was under review. This was the Johnson "cancer cure" case, fully treated in the CIRCULAR for last July, pages 339 and 373. In this case the supreme court of the United States decided that the food and drugs act does not authorize the government officials to prohibit the making on drug labels of therapeutic claims and predictions. It was largely the claim on the label that his preparation was a cure for headache and a brain food that caused the court to decide adversely to Mr. Harper.

Of the one thousand cases in which judgments have been rendered, less than twenty per cent. involved drugs, the rest having to do with foods; honey, olive oil, flavoring extracts, spices, and other so-called drugs which are used principally as foods, being considered as belonging in that class. Of the one-hundred and sixty-odd drug cases, all but an almost negligible number have gone against the defendants. Of these cases no less than a score grew out of the misbranding of alleged headache cures, the misbranding, as we recall the various cases, consisting in nearly every instance of erroneous statements concerning the presence of acetanilide, or the quantity present. Narcotic-laden baby soothers, too, have come in for a large share of attention.

The benefit to the legitimate drug business of ridding it of medicines which are fakes and frauds, is incalculable, and druggists, therefore, are more benefited, from a purely business standpoint, by the enforcement of the drugs portion of the law than any other class of people.

As to whether each and every court decision and departmental action under the statute has been just as we would have had it, and whether things might have been done under the act which have remained undone, are questions which we are not now discussing. But we should remember that the law is crude and roughly drawn, and that those who are working under it—judges, jurors, executive officials, witnesses, and others, including manufacturers and dealers—are treading on new and strange ground, and

being only human, are not free from error. When we recall all this, then we may say that if no mistakes had been made in connection with the law, a modern miracle would have been wrought. But the law will not remain always new and crude, and those charged with its enforcement—as well as those who are most directly interested in its provisions—will not continue to be somewhat in the dark as to what their duties, rights and privileges are under it, and so we may confidently look for still greater improvement in food and drug conditions all along the line.

Truly the work of the department of agriculture, more especially that of its bureau of chemistry, is something for which the people of this country may well give thanks—thanks which should be no less sincere and fervid when it is remembered that a large and important part is accomplished without invoking the intervention of courts, and so is not chronicled in notices of judgment.

Paying Money to Unauthorized Persons.

From time to time we have felt called upon to warn our readers against paying money for us to strangers.

In this connection we wish again to say that all representatives of the CIRCULAR have letters of authorization from this office signed by the manager and bearing a date not over one month old, and no money should be paid for our account to anyone claiming to produce us who is unable to produce such a letter.

A subscriber paying money intended for us to an unauthorized collector does so at his own risk, as such collector acts as the subscriber's agent and not ours. Nevertheless we want to do all we can to protect our friends from loss, and so occasionally publish warning notes on this subject.

In this connection we desire to impress upon subscribers who request that we change their address on our mailing list, the necessity for sending the *old* as well as the *new* address.

THE WORD MIL, meaning milliliter or cubic centimeter, is objected to in some quarters because it may be confused with "mill," meaning one-tenth of a cent. If we discontinue the use of the word on that account, then to be consistent we should cease to use "gr." as an abbreviation for "grain," on the ground that it might be read "gross." Now, "gross" is a much used word, while "mil," meaning the tenth of a cent, is a word that is seldom employed, and then usually in connection with a tax levy, which has less to do with cubic centimeters than a grain has to do with a gross. And should a university graduate cease to use the letters A. B. after his name because in his undergraduate days they meant "at bat"? The objection is overruled.

FAILURES BEFORE THE PENNSYLVANIA BOARD OF Pharmacy amounted to over eighty-six per cent. at the August examination. Applicants for licensure as pharmacists—all, under the "prerequisite" law, being graduates of "recognized" colleges of pharmacy—numbered twenty-nine, only four of whom were successful. What is the matter with the boards—or the colleges—or the candidates? There is something wrong, somewhere.

The Drug Business in Hawaii.

BY GEORGE W. SMITH.

A description of the drug business in the Territory of Hawaii requires first, a brief description of the country and a little of its history, the more so owing to the fact that so many confuse us with the Philippines, and, in efforts for business, furnish us with letters and price lists in the Spanish language.

WHERE HAWAII IS.

The Hawaiian Islands (formerly called the Sandwich Islands) lie in the Pacific Ocean, 2,100 miles southwest of San Francisco.

The capital city, Honolulu, is an important shipping center and stopping place for trans-Pacific steamers en route from the Pacific Coast to China, Japan, the Philippines, Australia and New Zealand.

THE DISCOVERY OF THE ISLANDS.

The Hawaiian Islands were discovered by the Spaniards near the end of the sixteenth century and were again discovered by Captain Cook in 1777,* who named them the Sandwich Islands in honor of his patron, the Earl of Sandwich, at that time the first lord of the British admiralty. At the time of Cook's visit he estimated the total native population at about 400,000. The islands were visited several times by Vancouver on his voyages to the northwest coast of North America.

In the earlier years of the nineteenth century the islands became more generally known to the world through the American whaling ships hailing from New England ports and, through the information taken home by these mariners, the condition and needs of the islanders attracted the attention of the good people of Boston, who determined that an effort should be made to Christianize and civilize the inhabitants of this important group.

RACE OF PEOPLE.

In this connection it is well to state that the Hawaiian Islanders are a part of the great Polynesian stock, inhabiting many of the islands of the Pacific, notably Samoa, Tahiti, Tonga, New Zealand and others. They are an entirely different race from the natives of Fiji, the Solomon Islands and Australia. They were never cannibals. They had a primitive civilization of their own with laws and regulations, called tabu, but no written language.

EARLY AMERICAN SETTLERS.

In 1820 the first band of noble men and women came from Boston, around Cape Horn, as missionaries to the islands. They landed in Honolulu, at

GEORGE W. SMITH.
A leading druggist of the Territory of Hawaii.

that time a village of grass houses only, inhabited by native Hawaiians, a few respectable white people engaged in trade, and runaway sailors of all nations who found in the simple but hospitable islanders a ready prey to all the vices which accompany the civilization of the white man. There were no frame houses, the first one, still standing, having been built of lumber brought from Boston around Cape Horn.

At that time, what is now California, was just passing from the sovereignty of Spain to that of the empire of Mexico. The city of San Francisco, then known as Yerba Buena, consisted of a few adobe houses inhabited by Spaniards and part Spaniards.

The first missionaries devoted themselves to cultivating the friendship of the natives, reducing the spoken language to a written one and, as rapidly as possible, translating the Bible into the native tongue. Other bands of missionaries followed in 1823, 1830, 1832 and along up to 1840. The islands rapidly became more widely known and were the rendezvous of the American whaling fleet; to the number of from 150 to 200 vessels a year, up to the time of the practical destruction of the fleet by the Confederate cruiser Shenandoah during the American civil war.

The government of the country, in these early days, was a limited monarchy under a native king. The first constitution was adopted in 1839, before California belonged to the United States.

EDUCATION AND INDUSTRY.

The first school for white children (children of the missionary families), was established in 1842, and it is interesting to note here that a man later to become lieutenant-governor of California, Romualdo Pacheco, was sent here in his boyhood to attend school, there being at the time no schools on the California coast where he could be educated in English.

Up to the time of the civil war the principal business of the islands was the furnishing of supplies to the whaling fleet, and the shipping of corn, wheat, potatoes, and other vegetables to the California coast, but after the destruction of the whaling fleet it became necessary for the white people to turn their attention to other means of livelihood. Prior to 1860 sugar cane and cotton had been grown in small quantities. As the growing of sugar cane promised the greater profit more attention was given to this product, so that to-day Hawaii stands next to Cuba in the amount of raw sugar produced, and nowhere in the world is the growth of cane and the production of sugar conducted in as scientific and thorough a manner as in the Hawaiian Islands. As the native population did not afford sufficient labor for the plantations it became necessary to import labor.

POPULATION.

First Chinese, then Japanese, Portuguese, Porto Ricans, Russians and Spaniards were brought, until to-day the population stands approximately as follows:

Hawaiians and part Hawaiians, 38,584; Portuguese, 22,294; Spaniards, 1,962; Porto Ricans, 4,828; Caucasian (American, English, German and other Europeans), 14,684; Chinese, 21,698; Japanese, 79,663; all others, 8,196. Total, 191,909.

The government of the country continued as a limited monarchy up to 1893, when, owing to some unconstitutional methods of the then ruler, the white residents, assisted by a number of prominent Ha-

* The Century Dictionary states that "the islands were discovered by Gaetano in 1542, and rediscovered in 1778 by Cook (who gave them the name Owhyee)."—Editor THE DRUGGISTS CIRCULAR.

waiians, overthrew the monarchy and applied to the United States to be annexed.

This application failed at the time and an independent republic was formed which existed until 1898, when, by act of congress, the islands were for-

Dr. Wood. The store was sold about 1852 to Dr. Lathrop and later to Dr. McKibbin, who conducted it until the later eighties.

In 1851 we find that drug stores were conducted by Alexander & Co., and by Dr. Hobart Welch, the lat-

Main Building, Drug Store of Benson, Smith & Co., Honolulu, T. H.

mally annexed and now constitute a regular Territory of the United States and not a mere "possession."

EARLY DRUGGISTS AND THEIR ADVERTISEMENTS.

The first reference to anything in the way of drugs or the drug business in Hawaii is found in the first English paper published in Honolulu, the *Sandwich Island Gazette*, under date of August 6th, 1836. It is as follows:

T. Kemble Thomas, Jr., M. D.

Attends to the duties of his profession at his office on the ground floor of the Pagoda.

Under date of August 7th, 1836, in the same paper we find the following:

Notice.

For sale on the ground floor of the Pagoda, Maws Apparatus, English Trusses, Fresh Ginger, Rochelle, Soda and Seidlitz Powders, Copperas, Salærat. Best Sponge, Chloride Soda, 100 lbs. Sulphur and a good assortment of Medicines.

In 1847 Dr. Watson advertises that a

General assortment of Drugs, Medicines, Perfumes, Fancy Soaps, etc., etc., is offered for sale next to store of C. Brewer Co.

In the *Polynesian* of February 16th, 1850, the following occurs:

Drugs and Medicines.

At the store opposite the Honolulu House the largest assortment ever offered in this market. [Followed by a long list of drugs, medicines, etc.]

This was probably the first legitimate drug store in Honolulu, and is supposed to have been conducted by

ter advertising that he drew his supplies from Davy, Machuerdo & Co., of London.

In 1853, Ruggles & Co., from Boston, conducted a store that was later sold to Dr. Hoffman, who retired in 1884.

The Oldest Drug Store in Hawaii.

The "Family Drug Store" of Hildebrand & Mott-Smith was conducted by this firm from 1853 to 1870, then sold to one Strehz, who failed in 1879. His stock and fixtures were purchased by Hollister & Co., at

that time engaged in the tobacco business. Eventually the name was changed to the Hollister Drug Company, now the oldest drug firm in the Territory.

A number of the early missionary physicians conducted "apothecary shops" in connection with their practices.

From the foregoing it will be seen that the first "American" drug store west of the Rocky Mountains was probably established in Honolulu. The stocks supplied at that time were all brought around Cape Horn from Boston or New York and from England.

THE DRUG BUSINESS AT PRESENT.

The business with which the writer has been connected since its inception, that of Benson, Smith & Co., Ltd., was started in 1883 in a very small way, wholly as a retail store. The business has now grown to very large proportions, doing both a retail and a wholesale trade.

At the present time there are five drug houses conducted by Americans in the Territory, four in the city of Honolulu and one in the only other city in the group, Hilo, on the large island of Hawaii.

The stores in Honolulu, in the order of their ages, are, those of the Hollister Drug Company, Ltd.; Benson, Smith & Co., Ltd.; Chambers Drug Company; Honolulu Drug Company. The one at Hilo is conducted by the Hilo Drug Company.

In addition to the foregoing Honolulu has twenty-two drug stores conducted entirely by Japanese, all qualified men, either graduates or licentiates in pharmacy, carrying the same line of goods that the American firms stock, and doing business in much the same manner. Twenty-odd other Japanese drug stores are on the other islands of the group, in the neighborhood of plantations.

A number of Chinese drug stores also exist, carrying, however, only the crude drugs handled in Chinese pharmacy.

The drug business in Hawaii is conducted on exactly the same lines as on the mainland of the United States, and a clerk coming from any part of the "States" would find himself handling and selling the same class of goods and under the same conditions as if he had only gone from, say, New York to Chicago. The language of the country is English but for the alien population, Chinese and Japanese, clerks of those nationalities are employed in all the stores.

DISPENSING BY PHYSICIANS.

One custom, however, obtains here that does not exist to any great extent [?] on the mainland: most of the physicians dispense their own medicines. This custom commenced in the early days and has not been changed, more because the patients are accustomed to it than because the physicians desire it.

Comparatively few prescriptions, therefore, are filled, the supplies of drugs and pharmaceutical preparations being furnished to the physicians by the drug houses.

The Territory of Hawaii has a pharmacy law similar to most of the older laws of the States. This requires that an applicant for a license must be a graduate or licentiate in pharmacy and must pass an examination before the board of pharmacy.

SHORT HOURS.

The hours of business are shorter than on the mainland. All of the drug houses close at 8:30 P. M., ex-

cept on Saturday nights. Sunday hours are from 8 to 10 A. M. and 5:30 to 7:30 P. M.

Clerks enjoy every other evening and every other Saturday afternoon off, in rotation, and every other Sunday all day.

SODA WATER, TOO.

Kalakaua

April 14/85

Prescription Written by Kalakaua, When King of the Hawaiian Islands.

prevailing trade winds, it is quite warm enough to make the sale of the great American drink, soda water, a large one. All the drug stores, as well as some of the confectioneries, have large and well-appointed fountains, and all classes of the population partake of the many forms of drinks offered, ice cream sodas being the favorites.

The only drug exported from the islands is kava kava root, piper methysticum, but in gradually decreasing quantities, as the land is too valuable to be devoted to its cultivation.

The principal exports are sugar, coffee, tobacco, some cotton, pineapples and some sisal.

A KING'S PRESCRIPTION.

Under the monarchy, during the life of the last king, Kalakaua, the writer numbered him among his customers. The king was interested in medical matters and kept in his library a book similar to the old-fashioned "Household Physician." From this he frequently selected prescriptions for the treatment of Hawaiians in his retinue or those in his small army known as the "household guards."

The writer has dispensed many of these prescriptions, and one is reproduced herewith, showing the

bold signature of the king, who died in San Francisco in 1892.

Business as conducted in the islands requires a larger investment of capital than on the mainland; the distance from the base of supplies necessitates the anticipation of wants a long time ahead, and the credit system is general in all lines of trade.

The writer has been a reader of the CIRCULAR since 1873 and a subscriber since 1880, and would not be deprived of the monthly receipt of this journal if possible to avoid it.

For the information in reference to the older drug houses the writer is indebted to Thomas G. Thrum, editor and publisher of Thrum's Annual, a work of standard authority in the Territory.

Strychnine Arsenite and Morphine Sulphate.

BY H. ENGELHARDT AND H. W. JONES.

Strychnine Arsenite.—To strychnine arsenite the following formulæ are ascribed: Merck's Index, 1907, gives $(C_{21}H_{22}N_2O_2)_2 HAsO_2$, corresponding to 86.1 per cent. of strychnine, while other authorities (Hager, etc.) state that the composition of this salt is expressed by the formula $(C_{21}H_{22}N_2O_2)_2 As_2O_3$, corresponding to 77.1 per cent. of strychnine.

To ascertain to which formula the strychnine arsenite on the market corresponds, we secured samples of this alkaloidal salt from four of the leading manufacturers of alkaloids, and determined the percentage of strychnine in them in the usual way. The determination was somewhat difficult on account of the salt being rather difficultly soluble both in water and acidulated water.

The following percentages of strychnine were obtained:

A. 75.65; 74.9. B. 72.76; 71.5. C. 69.2; 71.0. D. 75.5; 75.3.

This shows that none of the salts corresponds to either of the above formulæ, but that all of them contain an excess of arsenous acid, which fact we have proven by actual determination of the latter.

All the salts were free from moisture, and did not contain water of crystallization.

Morphine Sulphate.—The United States Pharmacopœia requires that on adding 4 c.c. (mils) of potassium hydroxide test solution to 0.2 gramme of morphine, a clear solution, free from any undissolved residue should result, showing the absence of and difference from other alkaloids. This test is too lenient. The test applied by the Swiss, German, Belgian, Austrian, etc., Pharmacopœias for the detection of other alkaloids in morphine hydrochloride (which salt is exclusively official in almost all of the other pharmacopœias) is much stricter. These pharmacopœias direct that when 5 c.c. (mils) of an aqueous solution of the morphine salt, 1:30, be dissolved in caustic potash solution and the solution be shaken with an equal volume of ether, the latter, after separation, should be clear and on evaporation should not leave a weighable residue.

We have examined four samples of morphine sulphate U. S. P. procured from different manufacturers and have found that the samples contained 1.45 per cent., 3.34 per cent., 2.83 per cent. and 3.97 per

cent., respectively, of other alkaloids, which consisted for the greater part of codeine.

The determination was carried out by dissolving a weighed quantity of the morphine salt in water, rendering the solution alkaline with caustic potash and shaking the mixture with various portions of chloroform. The chloroform after being shaken for several times with small quantities of water, to remove traces of suspended alkali, was evaporated to dryness and the residue titrated in the regular way.

Foresight.

BY WILLIAM H. ROWE.

When a business man has no plans for the future that man has not much of a business future.

The man who does not know where he is going, but thinks he is on the way, will find it a long journey.

Foresight, if we would settle any question wisely, is just as important as hindsight or insight: Our plans for the future will modify or establish many of our present decisions.

Many men who by their practical wisdom have won the reputation of being "long headed" are only "long sighted." They saw the condition or opportunity approaching and prepared themselves for it. Theirs was the gift of foresight.

WILLIAM H. ROWE.

Author of the article here-with on "Foresight" as well as of similar articles, on "Hindsight" and "Insight" appearing in the issues of the Circular for August and September, respectively.

AIR CASTLES AND OTHER STRUCTURES.

The druggist may well leave the "dip into the future" for curiosity alone

to Ganderbone and all his numerous family of weather prophets, and air-castle building to the architects of flimsy day dreams, yet what his business will be five or ten years hence depends in a very large measure on what his hopes and plans are for it as he looks ahead. If he uses a wise foresight he may be able to establish as fact what now seems to him but wild dreams and build sure foundations for what at the present seem mere air castles. The building must be an ideal in the mind of the architect long before it is a fact in stone and steel, and exist in lines and figures on the blue print before it rises in substance upon its foundations.

I have often thought that it would not be time wasted if any druggist took a little while away from the active parts of his business and quietly thought out his problems and made his plans for the future. The politician does not plan his campaign on the stump, nor the lawyer his conduct of a case in the court room, nor, indeed, are big business deals put through in this way, and why should our smaller, but to us no less important, concerns be launched with no thought but that which we can have when harassed by a thousand and one interruptions? Marsden's often quoted advice to the young man entering business is to plan his work thoroughly, and then thoroughly work his plan. Some good ideas may have sprung full-panoplied from a great head, as did Minerva, but

the most and the best of them, like Topsy, "just grewed."

As we adjust our eyes for the long look ahead in order that they may not become dull and misty with castle building, let us pick up our pencil and jot things down as they come to us. It will serve as a sort of anchor to hold us to the realities, and our plans are twice as likely to be definite if we write them out as we go along. In fact, one of the best devices I know for developing foresight is to keep at hand a little book in which any plan may be put down in black and white and stored away to be found just the fit in the time of some future need.

WHEN WE ARE OLD, THEN WHAT?

Taking, if we wish, the longest possible range of foresight, our look—that is, the look of us younger men—should not take into consideration so much our present position as the place we wish to occupy thirty or forty years hence. This advice might seem more pat if given before a man has tied himself down to any established business, yet any man though he is already committed to a definite place would do well to look away to the time when he will be fifty or sixty years old, and judge all things in the light of what he wishes to be or to have at that age.

It seems a rule almost without any exceptions that until he is thirty a man should not let anything however much present good it may offer turn him away from what will give the best reward in the future. If he feels that he has the right power in him, a small business with a good chance for growth is much better than a larger one that has reached its fullest expansion. A young man rich only in prospects may often be laughed at by the unthinking, but many times the last and best laugh belongs to him.

As one takes the long look ahead, he should consider his own capabilities, and one can measure them pretty nearly by a look back over what he has accomplished during the past five years. Then he should think of just what his ambition is, not what his gilt-edged dream pictures, perhaps, nor what his doting mother laid out for him when he was a baby in arms, but what to him means happiness and peace of mind, and thus have it fixed as nearly as it can be by rule of thumb.

After a man has taken a sane inventory of himself, then let him take a like sane one of the conditions with which he is surrounded, judge the possible expansion of his business, the future of his town or city, and the class of trade to which he must cater. Comparing what he wants to do with what he will be able to do in his present position—what he can do with what he might do—will reveal something that perhaps will be an unwelcome revelation to him at the time, yet something which thirty years hence, if it is heeded, will make him glad that he stopped to take the glance ahead.

A SHORTER LOOK.

But with most of us, our use of foresight will not be in looking into the future years, but to looking ahead to the weeks or months just before us. "Campaign" may sound like a big word for a small retailer to apply to any plan he may have for his business, yet the campaign idea, setting up an object and working toward it over well defined lines, is a method much in use to-day. We have political campaigns, educational campaigns, and evangelistic campaigns, large business men have their advertising campaigns, and

even the women are having their suffrage campaigns. And no matter how small the business, the benefit to it would be surprising did we go about its improvement along methodical "campaign" lines.

AN ADVERTISING CAMPAIGN.

To take but one instance, the matter of advertising. The average business man, if he does any at all, is going at it haphazard. He makes up his copy to fit an idea that occurs to him on the moment, not along lines that he has had in mind for months, and which are a part of a well thought out plan. If he happens to have had a shipment of something new, that, no matter how much out of season it may be, will be featured. He manages his advertising much as a drunken teamster might manage his team if it were stuck in the mud. The horses are pulled first this way and then that, or unhitched and attached to different parts of the load with no long steady pull in one direction. The result to the load and the business is about the same.

Long before the first of January the business man should have planned his next year's campaign, and his program should be complete, if not for the whole year, at least, for some months ahead. If he reads the papers devoted to his business—and he is needlessly handicapping himself if he does not—he will find much in the experiences of others to help him in his. There was a very helpful paper on this subject read at the meeting of the American Pharmaceutical Association in 1909 by Mr. J. W. T. Knox which is brim full of solid advice and contains a specimen layout of a year's advertising that is a most suggestive model for any druggist in his planning.*

WINDOW DISPLAYS.

One of the religious papers a short time ago published a symposium in which many of the foremost preachers of the country told how they prepared their sermons. The plan of about two-thirds of them seemed to be to "grow" the sermons. They did not manufacture them by forced process the week they were to be delivered, but had been building them up for weeks and gradually adding to them so that all that they needed in order to fit them for preaching was to perfect them. Would this not be a good method for us druggists to use in preparing our windows?

I am afraid we often have the old display removed and the glass washed before we have fully decided what we are to put in. This perhaps accounts for the dread with which we look forward to the day when the change should be made. Maybe it explains, too, why we so often let displays remain until their day of usefulness is passed and the floor of the window has become a cemetery for flies. We do this latter, be it said with a groan, knowing full well that an old display materially injures any store and is a sad comment on the business character of the druggist who allows it to remain.

If we are conducting an advertising campaign, our windows, of course, should be used to further the campaign, and we should know some weeks ahead what we are to put in them on a certain date. In such a case we should have plenty of time to use our hindsight in looking back over our store of ideas and to work up such as seem appropriate to make them fit our case, or, we could look for new ones in other

* This paper is reprinted in THE DRUGGISTS CIRCULAR for October, 1909, page 536.—Editor THE DRUGGISTS CIRCULAR.

places. When we have found something that is of use to us, let us drop it into an envelope that bears the date on which we can use it. If we see a trim in another window that seems attractive, it would be well for us to write a description of it and put it in the envelope with the other material. The background can be arranged for motion apparatus manufactured, and show-cards written at leisure moments long before they are needed, so that but a few minutes will be needed on the appointed day to put them in place. The trouble will thus become a pleasure, the trim will be made on time, and no valuable hours' aid to the advertising will be lost.

With hindsight to glean and bind for our use the experiences of the past, with insight keenly looking into our actual standing at the present, and foresight peering sharply ahead so that the hand may be wisely guided, the druggist's field of vision is complete. Hindsight, insight, foresight, and greater than all these is their wise combination, common sense.

Cloudy Ammonia.

The following formula for a cloudy ammonia water suitable for bath or shampoo was contributed to the *Canadian Pharmaceutical Journal* by Henry Watters, of Ottawa:

Powdered borax.....	2 drams.
Water	6 ounces.
Ammonia water (30%).....	5 ounces.
Oleic acid.....	2 drams.
Cologne water.....	4 drams.

Dissolve the borax in the water; add the ammonia water, and then the oleic acid previously mixed with the cologne water.

Instead of the oleic acid, 4 drams of soft soap may be used.

The cologne water used by Mr. Watters has the following formula:

COLOGNE WATER.

Oil of bergamot.....	10 c.c. (mils).
Oil of orange, sweet.....	10 c.c. (mils).
Oil of neroli.....	2 c.c. (mils).
Oil of lemon.....	2 c.c. (mils).
Cologne spirit.....	1000 c.c. (mils).
Stronger orange flower water.	enough

The oils are dissolved in the spirit; and enough orange flower water is added to cause a slight opalescence. The liquid is allowed to age as much as possible before filtration.

Veterinary Embrocation.

Oil of origanum.....	1 ounce.
Liniment of soft soap.....	3 ounces.
Oil of turpentine.....	4 ounces.
Ammonia water.....	4 ounces.
Camphor	1 ounce.
Compound tincture of benzoin.....	1 ounce.

Wehner's Paste.

Zinc oxide.....	30 grammes.
Starch	30 grammes.
Glycerin	10 grammes.
Water	10 c.c. (mils).
Wool fat.....	10 grammes.
Cerate	10 grammes.

The Oxypathor Humbug.

"It is sometimes hard to decide which is the greater—the impudence of the quack or the credulity of his victims. The comparative ease with which the medical faker is able, by the most preposterous claims, to separate the trusting from their money indicates the enormous potentialities in advertising. It might be supposed that an individual who set out to sell, as a panacea for all ills of the flesh, a piece of brass pipe with one or two wires attached to it, would, commercially speaking, have a hard and rocky road before him. But such a supposition would be incorrect. Not only would the enterprising faker find customers for his gas-pipe, but there would be such a demand for this most inane of 'therapeutic' devices, that two or three imitators would immediately enter the market."

With these words begins a little brochure entitled "The Oxydonor and Similar Fakes," issued by the American Medical Association. The author of this interesting pamphlet begins with an exposure of the electropoise and the claims made for it addressed to the therapeutically silly, and pays his respects in turn to the oxydonor, the oxytonor and the oxygenor. He then has a few words to say about the oxygenator or oxypathor, one of the later of this sort of fakes. "More recently," he says, "still another modification of the gas-pipe cure has been foisted upon the public." This at first was called the oxygenator, but has been changed to oxypathor. To quote again: "The oxygenator (or oxypathor) in appearance resembles the oxygenor more than it does the oxydonor. It consists of a cylinder with two cords and discs; the latter to be attached respectively to the ankle and wrist of the user . . . the user of the oxygenator may take his choice of two explanations of how the instrument works; either it causes the body to attract the oxygen, or it pumps the oxygen into the body. As both statements are falsehoods, it makes little difference which one the gullible purchaser accepts."

The advertisements of this species of the gas-pipe genus of fakes state that the oxygenator is the supreme master of diphtheria. "No earthly power," they proclaim, "except the oxygenator can take the slowly choking child, and with speed, simplicity and safety bring it back to health." It seems almost as if a certain old-fashioned kind of sudden choking until the victim is entirely beyond all earthly power to bring him back to life is too good for a man who is heartless enough to put into the hands of the ignorant parents of a child dying of diphtheria, such a fake and tell them that it is better than the treatment which the child would receive at the hands of an intelligent physician.

The sale of the oxygenator in Vermont has been forbidden by the board of health of that State, tests having shown it to consist essentially of a tube filled with inert substances, apparently factory waste, consisting of coke dust.

An attempt on the part of the proprietors of this fraud to make, for a consideration, the advertising columns of THE DRUGGISTS CIRCULAR a party to their scheme to draw retail druggists into their disreputable business of cruelly deceiving the public, was unsuccessful. Of course no reputable druggist, with the facts in the case before him, would have anything to do with such a swindle.

Statistical Report of Prescriptions.*

Summary of 117,000 prescriptions, comprising 122 individual collections mostly of 1,000 each from consecutive druggists' prescription files during 1907 and 1908, representing fifty-seven cities in twenty-eight States.

The word "articles" used here means the active ingredient not including simple solvents like water, syrup, alcohol, etc.

For the purpose of comparison, the total articles 2,223 have been divided in six groups as follows:

1. The articles of the United States Pharmacopœia.
2. The articles of the National Formulary.
3. The articles of the New and Non-Official Remedies of the American Medical Association, chiefly synthetic chemicals, not including proprietary pharmaceuticals.
4. Proprietary pharmaceutical preparations and dietetic products.
5. Drugs of organic derivation, their preparations and principles.
6. Chemicals, inorganic, their preparations and products. The distinction in 5 and 6 is not especially defined.

Comparison of six groups in the (a) number of articles of each group, (b) number of times used, (c) the percentage ratio of the articles of each group, and (d) the percentage ratio of times used.

	Number of articles.	Percentage of articles.	Number of times used.	Number of articles.
1. United States Pharmacopœia.	970	43.0	162,770	83.0
2. National Formulary.....	319	14.5	10,765	5.5
3. New and Non-Official Remedies	160	7.5	11,783	6.0
4. Proprietary	475	22.0	7,640	4.2
5. Drugs and Preparations.....	210	9.0	1,259	0.8
6. Chemicals and Preparations..	89	4.0	941	0.5
Total	2223	100.0	195,158	100.0

THE FIFTEEN SUBSTANCES MOST FREQUENTLY PRESCRIBED IN ORDER OF TIMES USED.

	Times prescribed.	Total.	In each 1,000.	Pre-scribed once in times—
1 Nux Vomica.....	4764			
Strychnine ..	3125	7889	67	15
2. Opium	2922			
Morphine ...	1458			
Codeine	3100	7480	64	16
3. Digestive ferments.	3500			
Pepsin	3000	6500	56	18
4. Quinine and salts.	4400		40	25
5. Calomel	4130		36	28

7. Phenyl salicylate (salol)	3360		29	35
8. Phenacetin	2600		23	43
9. Bismuth subnitrate	2574		22	45
10. Cascara sagrada...	2600		22	45
11. Potassium iodide..	2300		19	52
12. Sodium salicylate.	2276		19	52
13. Caffeine	2049		17	60
14. Arsenic	1900		16	62
15. Acetanilide	1500		12.3	80

Alkaline Peppermint Lotion.

This formula is in use at a London Hospital:

Oil of peppermint..... 5 minims.
Water 20 ounces.
Borax 1 dram.

* From the report of the committee on pharmacopœial revision made by Dr. George C. Diekman at the 1911 meeting of the New York State Pharmaceutical Association, based upon data collected by the late Prof. C. S. N. Hallberg.

Aromatic Fluidextract of Cascara.

Cowley offers (*Chem. and Drug.*) the following process for preparing an aromatic liquid preparation of cascara sagrada, each cubic centimeter (mil) of which represents 1 gramme of the drug:

Cascara sagrada (in No. 20 powder) 1000.0 grammes.
Diluted sulphuric acid..... 50.0 c.c. (mils).
Alcohol (90%)..... 200.0 c.c. (mils).
Oil of coriander..... 2.1 c.c. (mils).
Oil of orange..... 2.1 c.c. (mils).
Spirit of chloroform..... 8.4 c.c. (mils).
Soluble saccharin..... 1.5 grammes.
Fluidextract of glycyrrhiza.. 200.0 c.c. (mils).
Ammonia water..... enough.
Distilled water..... enough.

Boil the powdered drug for two hours with 750 c.c. (mils) of distilled water containing the acid; allow the mixture to stand for twenty-four hours; then pack in a percolator and percolate with distilled water until the drug is exhausted. Neutralize the percolate with ammonia water, and evaporate on a water bath to 600 c.c. (mils), maintaining slight alkalinity throughout the operation by the further addition of ammonia water from time to time. Dissolve the oils and saccharin in the alcohol; add the spirit of chloroform and the fluidextract of glycyrrhiza. Mix this with the concentrated extract, and, if necessary, make up to 1000 c.c. (mils) with distilled water.

Photographic Duplex Bath for Black Tones.

The following combined toning and fixing bath will give black tones on printing-out paper prints made from strong negatives:

Sodium thiosulphate..... 12 ounces.
Potassium sulphocyanide..... 2 ounces.
Sodium acetate..... 3 ounces.
Potassium alum..... 300 grains.
Silver chloride..... 200 grains.
Gold chloride..... 30 grains.
Ammonium chloride..... 1 dram.
Distilled water..... 56 ounces.

Dissolve the first five ingredients in 40 ounces of water, in the order given, making sure that each is dissolved completely. Set aside in a stoppered amber-colored bottle for twenty-four hours, and filter. Dissolve the gold chloride and the ammonium chloride in 16 ounces of water, and mix the two solutions.

The printing should be carried a bit to excess, and the prints immersed in a 5 per cent. solution of sodium carbonate before being placed in the bath.

Califacient Liniment.

F. K. Heldmann, of Syracuse, proposed the following formula for a warming liniment at the recent meeting of the New York State Pharmaceutical Association:

Oleoresin of capsicum..... 0.25 gramme.
Methyl salicylate..... 20.00 grammes.
Liniment of soft soap..... 20.00 grammes.
Wool-fat..... enough to make 100.00 grammes.

"Physicians whom I have induced to use this," he says, "have found it to be a splendid remedy."

Abstracts

Fatal Laboratory Anthrax.

The great risk involved in handling disease germs is again brought to notice by a recent case of fatal anthrax in man, reported in the London correspondence of the *Journal of the American Medical Association*. A laboratory attendant in one of the hospitals after suffering from headache for a few days went to one of the physicians showing a small pimple on his neck. The pimple was apparently not thought seriously of by the physician at the time, but by the next morning it had become enlarged to the size of a shilling and seemed to show signs of anthrax; the bacilli were found on bacteriological examination. The whole of the lesion was immediately removed, the temperature fell, and in a day or two the patient seemed to be out of danger, but the temperature again rose and in spite of serum treatment he died on the tenth day. The source of infection must have been some tube which he had touched in cleaning up after the students, who were working on anthrax bacilli. Probably he then scratched his neck. Some student had probably allowed some of the organisms to get on the outside of the tube and failed to report it, so that the tube might at once have been put in the steam sterilizer.

The Value of Russo's Test.

Nelson (*Med. Rec.*) makes a comparison of the Widal reaction, the diazo reaction, and Russo's urinary test in the diagnosis of typhoid fever. The last-named test gave 86 $\frac{2}{3}$ per cent. of positives; the diazo reaction, 33 $\frac{1}{3}$ per cent.; and the Widal test, 40 per cent., in fifteen cases subsequently determined by agglutination or cultures. Russo's test is made as follows: To 4 or 5 c.c. (mils) of the patient's urine add 4 drops of a 0.1 per cent. aqueous solution of methylene blue; mix well and examine against the light; a mint or emerald-green coloration is positive, whereas any bluish tinge renders the test negative. Russo reported the reaction as being unaffected by boiling or by the ingestion of such drugs as calomel, quinine, salol or caffeine; and also pointed out that the gradual resumption of the bluish tinge, as the patient advanced in the disease, was a valuable and favorable prognostic sign.

Change of Structure of Aluminum.

Le Chatelier (*Compt. rend.* through *Journ. Franklin Inst.*) notes that some aluminum articles underwent spontaneous disintegration, and on examination showed that in each case a cellular structure had developed, and that the disintegration was evidently due to the opening of the joints between the cells. Laboratory experiments indicated that the presence of small quantities of calcium was probably the cause of the development of this cellular structure.

To Preserve Rubber Instruments.

Talj, after investigating a number of means suggested for preserving rubber instruments, reports (*Military Surg.*) that he obtained the best results by exposing the instruments to the vapor from ammonium carbonate.

Effect of Nitrates in Drinking-Water.

Young (*Journ. Am. Med. Asso.*) having occasionally received samples of well-water suspected of having peculiar properties found on testing them that they were in every case high in nitrites. At the present time nitrates in water, in the absence of nitrites and considerable amounts of free ammonia [?] are taken as indicating that the natural purifying agencies have done their work, and that all nitrogenous organic matter has been oxidized to a harmless condition and an unfavorable environment for pathogenic organisms has been set up. From the observations he reports, however, it would seem that this process of oxidation may be carried to the extent of producing disagreeable effects, to say the least. The diuretic action of potassium nitrate and sodium nitrate is well known, and some therapeutic writers have attributed a special diuretic action to the nitrate ion itself. Eight specimens, the history of whose action was obtained at first hand, showed an excess of nitrate that would cause a person drinking a gallon of water a day to take in four diuretic doses. The accounts appended show that in every case a marked diuretic effect was produced in persons on first using the water, and in two of the eight cases the marked kidney irritation set up did not disappear in the customary use of the water. The symptoms reported were markedly noticeable and sometimes decidedly disagreeable, and chronic kidney trouble existed in some of the persons reported. The author does not attempt to claim definitely that the amount of nitrates present is the absolute cause for the condition, but the evidence points strongly to that conclusion. He hopes that the facts presented will be brought to the attention of others who have the opportunity for physiologic experiments on water-drinking, and that this may lead the way to experiments that will show definitely whether or not nitrates in water can reach a proportion sufficiently great to be in themselves harmful.

Cause of Pellagra.

Mizell (*Journ. Rec. of Med.*) advances the theory that pellagra is caused by the eating of much adulterated olive oil or other fats. He defines pellagra as "a disease due to eating semi-drying oils in quantities that cannot be normally disposed of, in which case they are deposited as fat foreign to the human organism, and in their final disposition by oxidation there is developed a series of end products that act in a deleterious manner upon all the cells and intercellular tissues of the body." The main ones of this group are oil of maize, oil of sesame and oil of cotton seed. They contain glyceride of linolic acid or linolin, which is the drying constituent. When it is brought into contact with an oxidizing agent it takes on oxygen and forms a series of volatile acids and aldehydes of these oils. The linolic acid readily combines with alkalies, the salts of which readily oxidize. The linolin has a strong affinity for sulphur and forms a compound which does not oxidize. The oxidation products, says the author, are the cause of pellagra. By interference with the formation of these products the occurrence of the disease is prevented or stopped. While food containing linolin may be consumed with no harm resulting, the limit, however, depends upon the sulphur present with the foods and in the body. The physiological limit is reached when the sulphur

is exhausted. When the above condition occurs, linolin is deposited in all the regions common to fatty deposits. With the rapid destruction of fat, atrophy of the skin and tissues at the site of the erythema appears. When the erythema disappears and the patient has taken on weight, the skin and tissues return to normal. This, of course, occurs when the rapid oxidation of fat ceases. The cessation is accomplished by placing the patient in bed, avoiding the sun and semi-drying oils from the diet. As a result of the above theory, calcium sulphide is recommended as an agent capable of combatting the deleterious action and enabling the organism to rid itself of linolin. The author has used the calcium sulphide for the past year and a half with satisfactory results. Failures may be accounted for on the ground of a long standing gastro-intestinal lesion antedating the onset of pellagra.

Test for Albumose in Urine.

Fittipaldi (*Gaz. Osped.* through *Journ. Am. Med. Asso.*) says that several years of experience have confirmed the advantages of his technic for the detection of albumose in the urine. The presence of a considerable amount of albumin does not interfere with the findings. After precipitation with alcohol, the precipitate is dissolved in soda solution, 31 or 32 per cent. The solution is then tested with a 5 per cent. solution of nickel sulphate mixed with equal parts of ammonia. A few drops of this mixture are added to the alkaline solution, and the presence of products of proteolysis is shown by an orange-yellow tint. This test reveals the presence of albumosoids in a proportion of 4 to 10,000, or less. The author admits that it is less sensitive than some of the other methods, but holds that it is a reliable one.

Medical Education Statistics for 1911.

In the annual educational number of the *Journal of the American Medical Association* are given statistics of medical colleges, students, and graduates for the year ending June 30th, 1911. There were 19,786 students studying medicine last year, the lowest number since 1900, and 1,740 less than last year. These are divided into 18,414 in the regular colleges, 890 in the homeopathic colleges, 433 in the eclectic and 49 in the physiomedical colleges. There were 4,273 medical graduates last year, a lower number than was graduated in 1890. The regular colleges had 4,006; the homeopathic, 152; the eclectic, 110, and the physiomedical college, 5. The homeopathic colleges have the lowest number since 1880. There are 13 less colleges than in 1910, the total now being 120, consisting of 101 regular, 12 homeopathic and 7 eclectic colleges. The last of the physiomedical colleges became extinct a few weeks ago. Women students constituted 3.4 per cent. of all students, as compared with 4.2 per cent. last year. Statistics show that college terms are being gradually lengthened. In 1901, 58 colleges had an annual session of only twenty-three or twenty-six weeks each. Now all colleges have sessions of over twenty-seven weeks and over 80 per cent. have sessions of from thirty-one to thirty-six weeks. Tabulated statistics of college fees, including matriculation, tuition and laboratory fees, show that 35 colleges charge \$100 or less for each student per year, 70 colleges charge between \$100 and

\$175 per year and 151 charge \$75 or more. Some high-grade colleges charge very small fees; and some low-grade colleges high fees. There is no reason, therefore from the monetary standpoint why students of limited finances should attend low-grade colleges. Among the colleges charging low fees are several strong State university medical colleges. Of the 120 existing colleges, 43, or about 36 per cent., now require one or more years of work in a college of liberal arts for admission, and several others have voted to establish this requirement in 1912. Nine State examining boards have established the requirement for preliminary education of one or two years' work in a college of liberal arts, thereby supporting the better class of colleges which have adopted that standard. Figures show that approximately \$6,000,000 were given during the last twelve months for new buildings, endowments, teaching hospitals and medical research in connection with medical schools. This does not include the additional \$3,820,000 given by Mr. Rockefeller for medical research at the Rockefeller Institute.

A Dangerous Incompatibility.

A correspondent of the *Lancet* has called attention to the fact that an emulsion containing almond mixture, tincture of squill, ipecacuanha wine and sweet spirit of nitre, sometimes explodes. This, it is pointed out, is due to the presence of tannin in the gum used to make the almond mixture. Tannin decomposes the ethyl nitrite, causing evolution of oxides of nitrogen, and though this may take place slowly, when the bottle is corked the liberated gas accumulates and may burst the bottle. The reaction noted will of course take place when other tannin-containing drugs are present. It has long been known that it occurs in mixtures of spirit of nitre and fluidextract of buchu, or of uva ursi, both of which contain tannin.

Distinguishing a Fish Bone in the Throat.

Fackenheim (*Therap. Monatshefte* through *Journ. Am. Med. Asso.*) reports a case in which it was impossible to distinguish a fish bone which had lodged in the throat and was causing much disturbance. The author had the patient eat some stewed huckleberries, hoping thus to discolor the fish bone and render it visible. This measure was successful, a blue point then being seen projecting 1 millimeter from the red left tonsil. The author has applied this staining method in a number of cases since, and always with immediate success. It seems to us likely that some other dark-colored fruits, as blackberries, might be made to answer the same purpose.

Detection of Atropine in Mixtures.

Pohl (*Therap. Monat.* through *Pharm. Journ.*) remarks the impairing of the delicacy of Vitali's reaction for atropine by pilocarpine often present in eye drops containing also physostigmine. To overcome this difficulty the author recommends that the solution should be made alkaline and shaken out with carbon bisulphide. The atropine, being the only one of the three alkaloids soluble in the carbon bisulphide, can thus be separated from them, and Vitali's test applied to the residue after evaporation of the solvent.

Selecting Sugar to Make Colorless Syrup.

Lehr (*Bull. Pharm.*) notes that the pharmacist often meets with difficulty in selecting a sugar to produce colorless syrup. He says that a sugar in large clear crystals will make, in most cases, a clearer syrup than can be produced from the smaller grains. The directions given in the United States Pharmacopœia offer a chance of caramelizing the small particles of sugar which may come in contact with the dry and therefore overheated surface of the dish, and it needs only a little caramel to give a tint of yellow to the syrup. May not dissolving in boiling water, and a careful removing of the scum if such develops, do just as well? The test as to the color of the sugar is conducted as follows: Put, say, 25 grammes in a white porcelain evaporating dish, so that it appears as a flattened cone. Then allow from a pipette 5 c.c. (mils) of distilled water to run carefully and little by little around the base of the heap. While the water draws slowly up to the top of the pile, keep on emptying the pipette until the whole heap is soaked—always running the water around on the base. If the sugar is off color—either blue, yellow or gray—this will show in the place where the water comes ultimately together, leaving either a large dot or a ring of the peculiar color involved. A comparison of the color, which is clearly distinguishable against the white of the dish, may be made with a standard approved sample if necessary to settle any doubtful case.

Acetanilide Poisoning.

Gardinier in a paper on this subject presented at a meeting of the American Therapeutic Society concludes that the continuous ingestion of acetanilide or allied products creates a perfectly definite symptom-complex characterized by cyanosis, enlargement of the heart, spleen, and liver; a definite blood picture and characteristic urinary findings. The acetanilide habit or addiction, he says, is a well established one and its enslavement is comparable to that of opium or alcohol. Acetanilide is a most virulent hæmolytic poison, which produces definite changes in the blood.

Fourth of July Deaths and Injuries in 1911.

For the ninth consecutive year the *Journal of the American Medical Association* presents in its issue for August 25th statistics of deaths and injuries caused by the "celebration" of the Fourth of July. The number of deaths was 57; against 131 last year. Ten of these fatalities were brought about by tetanus following wounds chiefly from blank cartridges; 12 persons were burned to death, most of these being girls and small children. In some of these instances the fire was caused by small-sized firecrackers and the so-called "harmless" sparklers. There were 11 deaths from gunshot wounds, 9 by explosion of powder, torpedoes, dynamite, etc., 2 from giant firecrackers, 5 from cannon and 8 from various other forms of fireworks. There were also 1,546 non-fatal injuries, the total of killed and injured being 1,603, as compared with 2,923 last year and 5,307 in 1909. In nine years the total number killed was 1,719, including 978 deaths from tetanus, and 37,410 were injured. Of those injured 130 were completely blinded, 577 lost one eye each, 462 lost legs, arms or hands and 1,624 lost one or more fingers. In this city there were 3 deaths, the highest number reported

this year for any one city. Chicago had 2 and eleven other cities had one death each. This is a very marked improvement over previous years. In 1907 this city reported 22 deaths, Chicago 16, Pittsburgh 10, and 24 other cities reported from 1 to 5 deaths each. "These marked reductions," says the *Journal*, "are clearly due to public sentiment, which has been thoroughly aroused during the last few years, against the awful results of the old barbarous methods of celebration. The campaign for a more uplifting and profitable celebration of the Fourth of July has likewise been more pronounced; prohibitive or restrictive measures have been more widely and better enforced than ever before. There still remains, however, too much indifference on the part of city governments, on which the real responsibility for these deaths and injuries rests." The *Journal* is entitled to the highest credit for the very considerable labor it has performed in forcing attention to our Fourth of July barbarity; that labor has been a leading factor—very probably the leading factor in the movement for the suppression of that barbarity which is now happily in progress.

Estimation of Nitric and Nitrous Acid in Water.

Tillmanns and Suttstoff (*Zeit. anal. Chem.*) propose the use of diphenylamine sulphuric acid for estimating nitric and nitrous acid in water. 0.085 gramme of diphenylamine is mixed with 100 c.c. (mils) of 23 per cent. sulphuric acid and then with sufficient concentrated acid to obtain 500 c.c. (mils) of solution. 100 c.c. (mils) of the water under examination are mixed with 2 c.c. (mils) of a saturated sodium chloride solution and 1 c.c. (mil) of this mixture is then mixed with 4 c.c. (mils) of the reagent. After an hour if a blue color is produced in the mixture it is compared with those obtained by treating nitric acid solutions of known strength in the same manner. If 500 c.c. (mils) of the reagent are diluted with 200 c.c. (mils) of water, the solution thus obtained, no longer reacts with nitric acid, but can be used for estimating nitrous acid; the addition of sodium chloride is not necessary in this test. The blue color produced by the reagent with nitric acid has the highest intensity after allowing the mixture to stand for an hour, while in the case of nitrous acid only 10 to 20 minutes are necessary for producing the greatest intensity. By this reaction the presence of 0.1 milligramme of either nitric or nitrous acid, it is said, can be detected.

Ptomaines in Preserved Fish and Crabs.

Desgres and Caius (*Apoth. Zeit.*) have examined preserved tunny-fish, sardines, mackerel, herring, lobster and salmon for the presence of ptomaines, employing for isolating Stas-Otto's method and for identifying Bouchardat's reagent. All the samples examined contained ptomaines (which, however, were only slightly poisonous), the amount ranging from 0.2 to 0.6 gramme per kilo. The authors found that the percentage of ptomaines is higher when the whole fish is preserved (0.47 gramme) than when only the meat is pickled (0.3 gramme), also that the inner part of the can generally contains more ptomaines than the outer part, which is probably due to insufficient sterilization. The oil added in canning does not inhibit the formation of the ptomaines, but seems to favor it.

Separation of Barium, Strontium and Calcium.

The following process for separating barium, strontium and calcium, worked out by v. d. Bos (*Pharm. Weekbl.*), depends on the fact that barium salts are precipitated in weak acetic acid solution by ammonium chromate, and of the insolubility of strontium chromate in 50 per cent. alcohol. The estimation is carried out as follows: The diluted solution containing the salts of the three alkaline earths is heated to boiling, mixed with 10 to 15 drops of glacial acetic acid and then drop by drop with an excess of ammonium chromate. After allowing to cool, the liquid is filtered through a Gooch crucible, the precipitate washed well with warm water containing acetic acid and ammonium chromate, then transferred to the crucible, dried and weighed. The combined filtrate and wash water are evaporated, the residue made slightly alkaline with ammonia and after the addition of ammonium chromate evaporated again. The dry residue is treated with several portions of 50 per cent. alcohol, the insoluble strontium chromate collected in a Gooch crucible washed with 96 per cent. alcohol and dried at 90° C. to constant weight. In the filtrate the calcium is determined in the regular way by precipitating with ammonium oxalate. A process similar to this has been devised by the author for estimating the metals volumetrically.

Dangerous Antiseptic Tablets.

The *Journal of the American Medical Association* in discussing the advertising of medicinal tablets to the public says: "Our attention has been called recently to a particularly dangerous form of advertising. A firm has put on the market a bichloride of mercury tablet, each tablet containing 7½ grains of mercuric chloride and these are sold under the catchy name 'clover antiseptic tablets.' Not only are these tablets sold under an innocent-sounding title, but the public safety is still further disregarded by their being made in the shape of a clover leaf. The good fortune supposed to attend the clover leaf would not only prove attractive, but would also lessen the sense of danger, because of the supposed harmlessness of vegetable remedies. The abuse of the corrosive sublimate tablet has borne bitter fruit in accidental poisoning by the use of this substance under the titles of antiseptic tablets, wafers, etc. There is much to be regretted by both the physician and the pharmacist in the history of the employment of mercuric chloride."

Chemistry of Pinus Pumilio Oil.

In addition to l-bornylacetate previously found in the volatile oil of pinus pumilio, Boecker and Hahn (*Journ. prakt. Chem.*) have succeeded in isolating an aldehyde $C_{15}H_{26}O$, a ketone $C_{15}H_{24}O$, and a substance with the empirical formula $C_8H_{14}O$. The latter which seems to impart to the oil the characteristic odor, is a very volatile oil, has the specific gravity 0.931 and boils at 216 to 217° C. It seems to be a ketone and has been named "pumilon" by the authors.

Heroine Addiction.

Brooks and Mixell report (*N. Y. State Journ. Med.*) two cases of heroine addiction observed in hospital practice, both patients being admitted about the same time. They have since learned that the heroine habit is by no means infrequent in this city.

Foglie uso Sennæ and Foglie uso Belladonnæ.

Under these names an Italian firm has shipped to Austria, leaves which in broken condition were sent as a substitute for senna leaves, while the whole leaves were sent as belladonna leaves. Mitlacher (*Zeit. allg. oester. Apoth. Ver.*) found that the drug consisted of the leaves of "Chinese sumach," *Ailanthus glandulosa*. While the leaves of this plant when in a dry state could be mistaken for belladonna leaves, the difference between the two is evident at once when they are moistened and spread out; the leaves of *Ailanthus* are oval and dentated at the base; quite frequently in the shipment leaves were found which were united on the same petiole, thus differing widely from belladonna leaves. Microscopically the leaves of *Ailanthus* can easily be detected by the unicellular hairs, the absence of stomata on the epidermis of the upper surface and the presence of numerous groups of crystals in the mesophyll. The author also calls attention to the fact that belladonna leaves are frequently adulterated with the leaves of *Phytolacca decandra* and *Phytolacca violacea*.

Some Italian Peppermint Oils.

Bourdet (*Bull. sci. pharmacol* through *Pharm. Journ.*) reports that an examination of some peppermint oils of the years 1910 and 1911 from Pancalieri (so-called Italo-Mitcham oils) gave results somewhat different from those previously recorded by Schimmel and others. Their solubility in 70 per cent. alcohol was greater, 2.8 to 2.9 volumes sufficing to dissolve one volume of the oil; the rotatory power was also greater than the previously published figures, ranging from $-22^{\circ} 56'$ to $-26^{\circ} 38'$, other observers having recorded figures from $-2^{\circ} 34'$ to $21^{\circ} 12'$. The specific gravity was from 0.904 to 0.915; some of them showed abundant crystallization of menthol when cooled in a freezing mixture.

Sanitary Association in Manchuria.

The *Oriental Physician and Druggist* quotes the following interesting news: During the prevalence of the pest epidemics in Manchuria a number of associations came into existence in various villages to enforce various preventive measures. These associations proved so beneficial to the rural communities during the epidemic that they have now decided to amalgamate themselves into a communal corporation. Altogether they number over 180, extending from the Sungari on the east to Chenchialing on the west. The membership registered is over thirty thousand, and they have gradually gained great influence in the province.

Alteration in Solubility of Extracts on Keeping.

Jacobsen (*Arch. f. Pharm. og Chem.* through *Pharm. Journ.*) reports that extracts of rhubarb, colocynth, and nuxvomica showed no change in their solubilities in alcohol or water after being kept for six to eight months; extract of gentian became less soluble in strong alcohol, but showed no change in its solubility in dilute alcohol. Extracts of henbane and belladonna showed such differences that no general statement could be made in regard to them. The solubility of extract of rhubarb did not depend on the temperature at which it was kept.

The Modern Materia Medica.

Antitherpin is said to contain peru balsam, tar and rape seed oil.

Antodyne is the glycerin ester of phenol.

Bilatin, a nutritive preparation, is said to consist of desiccated milk, freed from fat by "a special process," with 5 per cent. of ovo-lecithin.

Curbitin is powdered pumpkin seed.

Dragées Ferrugineuses du Dr. Rabuteau, recommended for anemia, contain chiefly ferrous chloride in addition to calcium phosphate, starch, tragacanth and milk sugar.

Ekzemin is a yeast preparation, marketed in the form of tablets.

Eleptin is said to be composed of sodium bromide, potassium bromide, zinc oxide, piperazin, phenacetin, sulphonal, physiological salt, borax and sodium glycerophosphate.

Eurhostin, exploited as a stomachic and roborant, is designated as "condurango-pepsin-peptone."

Euskol is the name for "bricks" which contain eucalyptus leaves and pine needles, and other constituents. Ignited they give off fumes, which are said to be beneficial in cases of asthma, rhinitis, catarrh, etc.

Fermentin is a yeast preparation in powder form.

Fersinal is an iron preparation said to be free from alcohol.

Forbil, a laxative, contains phenolphthalein.

Formosan, for the treatment of obesity, is said to contain chiefly extract of bladder wrack.

Friesen Bonbons, recommended for cough and hoarseness, are said to contain the active principle of galeopsis ochroleuca.

Fruchtan Brod (bread), which is recommended as a laxative, is to be prepared from nuts and fruits.

Furunkulin Soap is a yeast preparation.

Gaba, which is identical with *Wybert's Tablets*, contains extract of licorice, acacia and oil of peppermint.

Gadiol is the trade name of a cod liver oil preparation.

Gaiacine is a French name for purified resin of guaiac.

Gastrogen is said to contain sodium bicarbonate, bismuth subnitrate, calcined magnesia, pepsin, milk sugar, and oil of peppermint.

Gehoeroel Schmidt contains almond oil, chamomile oil, cajeput oil and camphorated oil.

Guajadol is para-iodoguaiacol. It is used hypodermically.

Guakalin-Neu is a saccharated solution of potassium sulphoguaiacolate.

Guyot's Teerliqueur contains vegetable tar made soluble by the addition of alkalies.

Haimagen contains iron, lecithin, albumin and physiological salts.

Heliosan is a name for the oil of sunflower.

Herban Helios, exploited as a remedy for diabetes, is said to consist of boldo leaves.

Hermæon tablets contain cocoa and "nutritive salts."

Herzen's Pepsinogen contains meat extract and carbohydrates.

Heufieber-Renitol is a solution of a local anesthetic in suprarenal extract.

Histopin is a staphylococcus extract.

Hungarian Pussta Tea, exploited for the treatment of constipation, is said to contain senna, hoarhound, red poppy, white and red clover, coltsfoot, peppermint, horse-tail rush, melilot, yarrow and hysop.

Hygiea Jarchow, for the treatment of leucorrhœa, is a solution of zinc sulphate in thymolized water.

Hydropyrin Grifa consists, according to an analysis made by Neuberg, of lithium salicylate and lithium acetyl salicylate.

Ichthojod is a compound liniment of iodized ichthyol.

Iecol is an emulsion of cod liver oil.

Ier-Preparations are said to contain the active principle of Paraguay tea.

Influenza Pulver (powder) **Erb** is ammonium salicylate.

Intraits Perrot is the name of powdered drugs in which the oxydases, ferments, etc., have been killed by heating with alcohol under slight pressure previous to drying.

Iodanthrak is described as an "adsorption product of iodine and animal charcoal." It occurs as a black, tasteless and odorless powder.

Iunogen for nervous diseases, loss of appetite, etc., contains carbohydrates, lecithin, lactose, nucleovitamin and salts.

Jahn's Rheumatismustee (tea for rheumatism), is said to contain pansy, yarrow, queen of the meadow, couch grass, licorice, and senna.

Katal Sauerstoff Inhalation is said to consist of sodium perborate, manganous sulphate, menthol, and oil of pinus pumilionis.

Konoor, a hair dye, contains the dangerous aureol, a mixture of methyl p-aminophenol, mono amino diphenylamine, aminophenol hydrochloride and sodium sulphite.

Lane's Catarrh Cure is a solution of phenol and sodium chloride in water.

Lecimorol seems to be a mixture of cod liver oil and lecithin.

Leukrol, for the treatment of chlorosis, anemia, leucorrhœa, etc., is a fluid extract of aristolochia jubaharis.

Lipojodin is diiodo-brassicidic acid ethylester.

Liqua is a preparation containing aluminum hydroxide and hydrogen dioxide. It is claimed to be superior to aluminum acetate.

Lithiopiperazin is a compound of lithium and piperazin.

Lonii, for the treatment of erythema nodosum, is

a suspension of zinc oxide in water, perfumed with lemon oil and bergamot oil.

Magentropfen "Stresowa" is an alcoholic extract of senna and rhubarb, sweetened with sugar and flavored with oil of caraway.

Massogran and Massolettes contain lactic acid bacilli.

Mayer's Physiologisches Nervensalz occurs as tablets containing ammonium phosphate, and talcum.

Meditannosin is another name for methylene-ditannic acid.

Membrosan is a nutritive preparation containing lecithin, albumin, ox-marrow and nutritive salts.

Methæthyl Henning is a mixture of ethyl chloride and methyl chloride.

Migrainepulver Bulling (migraine powder), is said to contain valerated caffeine, acetanilide, and phenacetin.

Migromint are tablets containing acetyl salicylic acid.

Mirogen is said to be the menthapinolester of formyl trichloride.

Narcole Mixture "Dr. Hirschlaff" contains morphosan, and euscopol.

Nebula Eucalyptic Composita is said to consist of eucalyptus oil, pine oil, cinnamon oil, menthol, thymol, camphor, and tincture of benzoin.

Neura-Lecithin is the name of a 70 per cent. lecithin. It is marketed in the form of tablets and powders.

Neurolin, exploited as a nutritive preparation, is described as "nutritive salts, peroxides, and iron."

Nicotiana soap, recommended for the treatment of skin diseases, especially ring-worm, is a superfatted soap containing precipitated sulphur and tobacco extract.

Novadrin Solution contains novocain and adrenalin.

Novoform, a substitute for iodoform and xeroform, is tetrabromocatechin bismuth, $\text{Bi}(\text{C}_6\text{Br}_4\text{O}_2)\text{OH}$. It occurs as a deep-yellow, odorless powder, insoluble in water but slightly soluble in most of the organic solvents and contains 30 to 32 per cent. of bismuth oxide.

Onéguin Tee (tea), exploited as a blood purifier, contains anise seed, star-anise seed, fennel seed, sarsaparilla, gentian, calamus, centaury, pansy, senna leaves and walnut leaves.

Perthyman, for whooping cough, is a "compound infusion of thyme."

Petrolimentum Liquidum contains paraffin, oleic acid, and spirit of ammonia.

Pilulæ Sanguinis contain hemaglobin and blood salts. They are marketed as such or in combination with various other drugs.

Plasmin Tablets are described as containing the nutritive salts occurring in the plasma.

Pneumonal is a solution of creosotal.

Polypin is a powder said to contain arnica flowers, chamomile flowers, pansy, roasted chestnuts, marjoram and thyme. It is put forward for the treatment of polyp of the nose, etc.

Quimorol is a solution of quinine and urea hydrochloride in physiological serum, and is marketed

both with and without the addition of adrenalin. It is put forward as a local anesthetic, especially for use in dentistry.

Reductol, for obesity, contains extracts of bladder wrack and cascara sagrada.

Rekonvalin contains desiccated milk and lecithin.

Renitol, for the treatment of rhinitis, is a solution of a local anesthetic in an extract of the suprarenal glands.

Roburogen contains desiccated milk, casein, lecithin, lecithin-iron and malt extract.

Rodolin, exploited for the treatment of whooping cough, is a saccharated extract of thyme.

Scharfin, a veterinary preparation, contains mercuric chloride, mercuric iodide and potassium iodide.

Schreiber's Original Ovula are suppositories containing bromine, lupulin and camphor.

Serosal, exploited for the treatment of calcification of the arteries, is a physiological salt mixture containing sodium chloride, phosphate, sulphate and carbonate, magnesium phosphate and calcium glycerophosphate.

Serum Anorganicum Trunccek, contains sodium sulphate, sodium chloride, sodium phosphate, sodium carbonate and potassium chloride, dissolved in water.

Sitosan, Dr. Michaelles, a nutritive preparation, contains water, nitrogenous matter, fat, sugar, starch, crude fiber, phosphoric acid, sodium chloride and ferric oxide.

Sphagnit, exploited as a disinfectant, is prepared from peat by treatment with hydrochloric acid and iron.

Stherosine Orel, is said to contain neurosine, theobromine, guaranine (caffeine?), gentiopicrin, and sugar.

Storaxol, an ointment for insect bites and skin diseases, contains styrax, resorcin, carbolic acid, and precipitated sulphur.

Strobilanthes Crispa, are the leaves of a Javanese acanthaceous plant, said to be used as a remedy for snake bites. An infusion of the leaves is also used for kidney stones.

Szymanol, Szymanskis, exploited for the treatment of rheumatism, consists mainly of camphor dissolved in horse fat.

Tai-tsa-ju, a Chinese loganiaceous plant, is used for snake bite, lepra, etc. It contains a yellow coloring matter and two alkaloids.

Terasol is a mixture of arrowroot, bean flour, and "saccharated iron."

Thymipin, put forward for the treatment of whooping cough, is prepared from thyme and butterwort.

Tri, is an abbreviation for trichlorethylene C_2HCl_3 .

Triela, is another name for tæniol, a tape-worm remedy.

Tuberkosan emulsion contains cod liver oil, eggs, potassium sulphoguaiacolate and calcium "silico-lactate."

Unicum, exploited for removing corns, occurs as sticks, consisting of soap plaster with salicylic acid.

Valkasa is a combination of soluble milk casein and glycerophosphates.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Solubility of Quinine Hydrobromide.—C. D. C., Ontario, has had a difference of opinion with a fellow-pharmacist as to whether the addition of a little diluted hydrobromic acid is necessary to produce perfect solution in the following:

R Quininae hydrobrom. 3ij.
Aquam ad 5iv.

Misce.

In reply we should say that it all depends upon the variety of quinine hydrobromide used. This salt is not official in the British Pharmacopœia; and in the British Pharmaceutical Codex two varieties are described: Quinine hydrobromide ($C_{20}H_{25}N_2O_2Br$, H_2O) and acid quinine hydrobromide ($C_{20}H_{26}N_2O_2Br_2$, $3H_2O$). The solubility of the first-named is given as about 1 in 55 in cold water. The acid salt is described as being soluble in cold water in the ratio of 1 in 7. The ratio in the prescription submitted by our correspondent is about 1 in 15.

Quinine hydrobromide U. S. P. ($C_{20}H_{24}N_2O_2 \cdot HBr + H_2O$) is the basic salt, the official solubility figures for which are 1 in 40 for water at 25° C. The same salt is official in the French Codex, wherein its solubility is stated as 1 in 44.5 of water at 15° C. The Spanish Pharmacopœia recognizes in bromurum quinicum neutrum the salt having the formula $C_{20}H_{24}N_2O_2 \cdot 2HBr + 3H_2O$, and attributes to it a solubility of 1 in 7. We believe that the quinine hydrobromide of the market is the basic salt, soluble in water at 25° C., in the ratio of 1 in 40. It therefore would not dissolve in the proportion prescribed without the addition of a little acid.

A Question of Liquidity.—"Kansas City," Missouri, writes: "I should like to have you tell me how to make a liquid out of the enclosed prescription, which our customer claims was a liquid when she had it filled before. Since the prescription brought us is a copy, I am inclined to think there is some mistake in it, as I cannot have any luck making a liquid out of it."

Here is the prescription:

R Sulph. præc. 3vj.
Pulv. camphoræ. grs. xx.
Tragacanth 5j.
Aq. rosæ.
Liq. calcis. aa. q.s. ad 3iij.

M. Sig.: Apply.

Our correspondent does not state how he compounded the mixture; and we are at a loss as to whether he made a 3-ounce or a 6-ounce preparation, the characters "aa q.s. ad" being variously interpreted by dispensers. The proper interpretation is "a sufficient quantity of each (of lime water and of rose water) to make (3 ounces); the mixture therefore should measure 6 ounces. If only enough of the menstruum to make 3 ounces is used, which is probably the intention of the prescriber, the liquidity of the

mixture will be less than if the directions are followed literally.

Another matter influencing the appearance of the finished product is the sort of precipitated sulphur used. In this case the pharmacopœial article should be dispensed; but the uniform suspension characteristic of dermatic lotions containing sulphur is usually secured by the use of lac sulphur, a variety of precipitated sulphur, prepared by precipitation with sulphuric acid from a solution of calcium polysulphide. Interesting notes on this subject appeared in the CIRCULAR for July, 1910, page 362; and March of the same year, page 119.

If "Kansas City" will reduce the camphor to a very fine powder by triturating it with a little ether, triturate the powdered tragacanth with the powdered camphor, add gradually with constant trituration about 2½ ounces each of rose water and lime water, sieve the sulphur on the surface of this liquid, and incorporate it by further trituration, adding enough of the menstruum to bring the finished product up to 6 ounces, we believe the result will be satisfactory to the patient and himself. If a 3-ounce mixture is required, that would be another story.

Preparing Concentrated Sulphuric Acid.—J. S., New York.—To prepare pure sulphuric acid from an acid containing 10 per cent. of water, one subjects the weaker acid to fractional distillation. This is a simple but very hazardous operation that can hardly be carried on in safety by one not well prepared for it. Laboratory experiments in this direction, while risky, are not impracticable, the following quotation from the United States Dispensary being to the point:

The only way to obtain pure sulphuric acid from chamber acid [sulphuric acid as it leaves the leaden chambers in the course of manufacture; it has a specific gravity of about 1.55] is by distillation. Owing to the high boiling point of this acid, the operation is rather precarious, in consequence of the danger of the fracture of the retort from the sudden concussions to which the boiling acid gives rise. We recommended that a retort of the capacity of from two to four quarts be used in distilling a pint of acid. This is connected, by means of a wide glass tube three or four feet long, with a receiver surrounded with cold water. All the vessels must be perfectly clean, and no luting employed. The retort is then gradually heated by a small furnace of charcoal, or, what is better, by means of a sand bath, the retort being buried in the sand up to the neck. It is useful to put into the retort a few sharp-pointed pieces of glass, slips of platinum foil, or clay tobacco pipe tubes, with the view of diminishing the shocks produced by the acid vapor. The distilled product ought not to be collected until a dense grayish-white vapor is generated, the appearance of which is a sign that the pure concentrated acid is coming over. If this vapor should not immediately appear, it shows that the acid subjected to distillation is not of full strength; and the distilled product, until this point is attained, will be an acid water. In the distillation of sulphuric acid, Lemberg uses, instead of pieces of glass or platinum foil, fragments of the mineral called quartzite; these after a time get worn and must be changed.

Of course in conducting this operation, good ventilation must be provided for and the corrosive fumes carefully avoided; which caution naturally applies in all cases where poisonous gases are liberated.

Camphorated Rhubarb.—C. H. J., Maryland.—We know of no definite formula for a preparation of this name. If anyone can help us, we should be glad to hear from him.

Non-Hardening Tooth Paste.—C. H. J., Maryland, makes a tooth paste, the principal ingredients of which are precipitated chalk, castile soap, glycerin and water. He has used the latter two in varying proportions, but in each case the paste became too stiff for use in an ordinary tube. He asks for help.

We suggest that he use instead of a portion of the water, solution of sodium hydroxide, say, $2\frac{1}{2}$ to 3 ounces in each pound of his finished paste. A formula for a tooth paste in which the use of this ingredient is directed is given in the CIRCULAR for May, page 253.

Incidentally we might add that we received this "tip" from a man who having used the alkali solution with good effect passed this knowledge along for the benefit of his brother pharmacists. In striking contrast to this man's action is the request of our present querist that we do not reveal to our readers his tooth paste formula, although dozens which we believe are at least as good have appeared in the CIRCULAR during recent years. If every man held on to all he knew, C. H. J. would have to work out for himself a method of improving his paste, or do without.

Another man who believes in the "give and take" principle on which we endeavor to conduct this department, is W. C. Kirchgessner, and in a paper which is printed in the CIRCULAR for October, 1904, page 233, he gives his formula for tooth paste for tubes, as follows:

Mass solution..... 200 c.c. (mils).
Precipitated chalk..... 500 grammes.

Mix, and put into collapsible tubes at once.
The tubes should stand a day or two before use.

Mass Solution.

Gelatin, in small pieces..... 30 grammes.
Castile soap (moist)..... 60 grammes.
Saccharin 8 grammes.
Menthol 8 grammes.
Oil of eucalyptus..... 8 c.c. (mils).
Oil of wintergreen..... 22 c.c. (mils).
Glycerin 1000 c.c. (mils).
Water 500 c.c. (mils).
Hot water..... 500 c.c. (mils).

Soak the gelatin in the water over night; dissolve the soap and saccharin in the hot water; mix the menthol, oils and glycerin. Pour all together in the order named, and let the mixture stand a day or two before using.

Lambert's Lithiated Hydrangea.—T. S., Pennsylvania.—Such knowledge as we have concerning this preparation is derived from the statement borne by the label on the bottle in which it is sold, which is that it "represents the active properties of fresh hydrangea arborescens, berberis aquifolium and scrophularia nodosa, together with benzoate and salicylate of lithium." It is also stated on the label that the preparation contains 25 per cent. of alcohol.

It seems that it would be no great pharmaceutical trick to turn out such a preparation, adjusting the proportions in such way as to have the finished product represent the doses desired by the prescriber. As the proportion of alcohol stated is rather small for a fluidextract or a tincture, glycerin might be used as a diluent either before or after extraction.

Pain Expeller.—J. K., Illinois.—There are so many different kinds of pain, caused by so many different kinds of troubles, that it is impossible to devise a universal pain expeller.

If you want an all-round liniment for use on anything from an aching tooth to an ingrowing toe nail, you might make some experiments, using one of the following formulas as a basis:

I.

Spirit of camphor..... 1 ounce.
Spirit of ammonia..... 4 drams.
Oil of sassafras..... 4 drams.
Oil of cloves..... 2 drams.
Chloroform 4 drams.
Oil of turpentine..... 4 drams.
Alcohol..... enough to make 5 ounces.

II.

Soap liniment..... 3 ounces.
Tincture of capsicum..... 1 ounce.
Ammonia water..... 1 ounce.
Alcohol 1 ounce.

III.

Camphor 1 ounce.
Chloral hydrate..... 1 ounce.
Chloroform 1 ounce.
Ether 1 ounce.
Tincture of opium..... 4 drams.
Oil of origanum..... 4 drams.
Oil of sassafras..... 4 drams.
Alcohol..... enough to make 5 pints.

Euquinine and Sodium Salicylate.—B. E., New York, found that a thick mixture, that could be poured from the bottle only with difficulty, resulted from the compounding of the ingredients called for by the following prescription:

R Tr. nucis vom..... ʒi.
Euquinine ʒi.
Sod. salicylat..... ʒij.
Elix. aromat..... q.s. ʒiij.

M. Sig.: ʒi t. i. d.

Aside from the fact that euquinine is such a bulky substance as to produce a rather thick suspension in the proportion given, we think that it reacts with sodium salicylate in the manner common to the ordinary quinine salts, euquinine being quinine ethylcarbonate. One characteristic of quinine salicylate which results from the combining of the alkaloid or its salts with salicylic acid or its salts is bulkiness. Therefore there are in the mixture under consideration two factors that tend to make it thick and non-fluid.

It is a prevalent consensus that euquinine is best dispensed dry in cachets, capsules or powders. It may be suspended in a non-alcoholic menstruum not in combination with other drugs.

Making Solution of Hydrogen Dioxide.—B. L. E., Illinois.—As a rule the methods of making solution of hydrogen dioxide in use by the large manufacturing houses are either trade secrets or are protected by patents. The process of which you say you have read was the official one in this country under the Pharmacopœia of 1890—see that book or a dispensatory. A note on one of the processes, patented abroad and possibly in this country, too, appears in the CIRCULAR for January, 1908, page 17.

Waterbury's Metabolized Cod Liver Oil.—T. S., Pennsylvania.—An examination of this preparation in the laboratory of the American Medical Association a couple of years ago showed that it contained no cod liver oil. Last year (see the CIRCULAR for May, 1910, page 256), the supreme court of the District of Columbia decided that the compound "does not contain cod liver oil . . . does not contain anything that ever was cod liver oil, and . . . does not contain anything that was made from cod liver oil." Incidentally, the name of the preparation has been changed since that decision.

All druggists who are interested in such things—and all druggists should be—should secure from the American Medical Association, Chicago, the pamphlets in which reports of its chemical laboratory are given. Not only will these be found of much general interest and value, but in an especial way will they open the eyes of druggists to the manner in which members of their calling are made the agents for the distribution of a great deal of stuff which is not what it is claimed to be, and therefore not what high-minded business men would care to handle.

But to get back to the Waterbury preparation: It is said to contain creosote and guaiacol. Formulas for "tasteless" preparations containing gaduol, but no cod liver oil, appear in the issues of the CIRCULAR for June and July, 1909, pages 293 and 350, respectively. The one in the latter issue is as follows:

Gaduol	2½ pints..
Oil of orange peel.....	9 ounces.
Fuller's earth.....	10 pounds.
Port wine.....	17 gallons.
Compound tincture of gentian....	5 gallons.
Fluidextract of wild cherry.....	2½ gallons.
Glycerin	5 gallons.
Extract of malt.....	4 gallons.
Compound syrup of hypophosphites	6¾ gallons.
Fluidextract of licorice.....	1¼ gallons.
Caramel	2½ pints.
Alcohol	2½ gallons.

This recipe is for a 40-gallon batch.

The creosote and guaiacol may be added in the desired proportions, dissolved in an appropriate amount of the alcohol.

Of course no honest merchant would offer as and for a cod liver oil preparation an article which he knew contained no cod liver oil. Whether or not gaduol is effective is a question for the physician to decide.

Pil. Blair.—C. P., Connecticut, wants to know what should be dispensed on a physician's prescription for "Pil. Blair, No. 24."

We do not know, but if guessing is in order, we should like to have three guesses. Our first would be that the physician wanted the proprietary Blair's gout pills; the second would be that he had in mind some Blair's pill of local fame; and the third guess we reserve until we find out whether or not both the others are wrong.

In a case involving the health, and perhaps even the life, of a human, we consider it most reprehensible for the prescriber to leave room for a reasonable doubt as to his meaning, or to mislead the dispenser by sending him an incomplete or illegible prescription. When the dispenser is in doubt and is unable to reach the prescriber, his safe course is to decline to fill the prescription.

Lice Exterminator.—J. K., Illinois.—Before recommending something for use in an effort to exterminate lice one should know what kind of lice are to be exterminated, and where they are.

We guess you want an exterminator for the lice which infest the human body, the head or other portions. Such an exterminator is a powder, said to be used largely in Europe, where it is known as *pulvis capuchinorum*. It is composed of equal parts of sabadilla seed, stavesacre seed, parsley seed and tobacco, all in fine powder.

Sabadilla and stavesacre are also exhibited for this purpose in the forms of tinctures and ointments.

Compound Tincture of Larkspur.

Larkspur is a popular poison for pediculi, and a number of formulas for compound tinctures of this drug have appeared in the CIRCULAR during the past few years. Some of these follow:

I.

Larkspur seed, ground.....	8 ounces.
Green soap.....	2 ounces.
Potassium carbonate.....	1 ounce.
Oil of lavender flowers.....	1 dram.
Alcohol	24 ounces.
Water	8 ounces.

Macerate for ten days with occasional agitation and filter, adding enough of a mixture of alcohol 3 parts and water 1 part, to make 32 fluid ounces; or the tincture may be prepared by percolation, after maceration for a few days.

II.

The following formula is for a preparation which is said to give better results, to be cheaper, and to be more easily made than the ordinary tincture:

Larkspur seed.....	100 grammes.
Potassium carbonate.....	10 grammes.
Alcohol	500 c.c. (mils).
Water.....	enough to make 1000 c.c. (mils).

Mix the seed and the carbonate with 500 c.c. (mils) of water; boil the mixture for five minutes; when it has become cold, add the alcohol; strain, and add enough water to make the finished product measure 1000 c.c. (mils). Filter, if not clear.

III.

A tincture which seems to give satisfaction to the trade in a town which is the seat of one of our largest universities, is as follows:

Larkspur seed.....	4 ounces.
Boiling water.....	6 ounces.
Alcohol	10 ounces.
Diluted alcohol, enough to make	1 pint.

Crush the seed in an iron mortar, transfer them to a suitable vessel, pour the boiling water upon them, cover the vessel and let the whole stand until cool; add the alcohol, stir well, and after twentyfour hours, filter through cotton.

IV.

In one of the large manufacturing establishments of this city, larkspur seed are ground, washed with benzin to remove the oil, and packed in a percolator with 85 per cent. alcohol for twenty-four hours. The stopper is then removed from the percolator, and alcohol of the same strength added until 1000 c.c. of percolate are obtained from every 100 grammes of the seed used.

This class of preparations is poisonous, and may

even exert their toxic effect through abrasions in the skin.

Desmons (*Jour. méd. Paris*) points out that the external shell of the ova of the pediculus capitis, because of its chitinous nature, is resistant to liquid applications unless they contain acetic acid. For the destruction of the insects and their ova he suggests that the infested parts be carefully wetted with the following:

Tincture of benzoin.....	5 c.c. (mils).
Corrosive chloride of mercury.	1 gramme.
Glacial acetic acid.....	12 c.c. (mils).
Cologne water.enough to make	1000 c.c. (mils).

Make a solution.

Because of the desquamative effect of too frequent applications of solutions of acetic acid to the skin, lotions containing it should not be dispensed except for use under the direction of a physician; and the well-known danger of using solutions of corrosive mercuric chloride should prevent druggists from indiscriminately putting this nit killer into the hands of the laity.

Deferred Payments.—John J. Davies, Pennsylvania, writes entertainingly as follows:

I have been a beneficiary of THE DRUGGISTS CIRCULAR for thirty years. During that time I have perused it monthly from cover to cover, which, of course, includes advertisements as well as reading matter, and as a result have derived from its columns a great deal of information of a purely commercial as well as a professional character. In return for this, beyond a reasonably prompt payment of my subscription fee, I have done nothing outside of several minor contributions to the department of "Notes and Queries," and this in face of the fact that the bulk of contributions to our class journals must necessarily come from the every-day, working pharmacist.

Every pharmacist worthy of the name, like every housewife, evolves from time to time little "wrinkles" of his own either in manufacturing or dispensing which cannot properly be called trade secrets—little "wrinkles" which save time or money, or which constitute an improved method—and it is his duty, whether he realizes it or not, to give his professional brethren the benefit of his experience. Knowledge which gives a man a commercial advantage over his competitors becomes a part of his stock in trade, and he is therefore justified in keeping it to himself; unless it is of that character, however, if he persists in keeping it to himself he is an ingrate, or else has an imperfect appreciation of his duty to his fellowman.

The following is therefore contributed as a species of conscience money which may or not be of value accordingly as the reader finds in it anything new or something already familiar to him.

Massing Pepsin.

In dispensing pepsin in pills or capsules, that is, when the pepsin is massed, difficulty is encountered because of the glutinous character of the mass. It becomes more like a piece of rubber, and consequently hard to roll. I refer, of course, to the granular pepsin which most everybody uses. If one uses the insoluble pepsin he will have no difficulty, but an ideal mass.

Dispensing Basham's Mixture.

The requirement that Basham's mixture should be made fresh often causes inconvenience when the dispenser is rushed. The instability of the compound being due to the iron, I get over this trouble by making up a supply of this preparation, omitting, however, the iron. When a prescription comes in for Basham's mixture we measure the prescribed quantity, and add thereto 20 minims of tincture of ferric chloride to each ounce, and all is done.

Griffith's Mixture, Too.

The same idea holds good in the case of Griffith's myrrh mixture. Enough of this preparation (omitting the iron) may be made to last six months, and when it is prescribed

all the druggist has to do is to take the required quantity, add 2½ grains of ferrous sulphate to each ounce and it is ready, and just as active as if prepared entirely at the time.

Solution of Magnesium Citrate.

Very few realize the double rôle played by carbonic acid in the official solution of citrate of magnesia in acting as a preservative and as an aid to palatability. It is a mistake to postpone the addition of the potassium bicarbonate until the solution is called for, as in the mean time this weak saccharine solution, like all others of its class, is prone to undergo decomposition. If we add all the bicarbonate as soon as the preparation is made there is a probable loss of gas through imperfect stoppers. To obviate this dilemma we add one-half, or 20 grains, of it when bottled, and the other half when the solution is called for. The first half acts as a preservative and the latter half gives it all the sparkle and snap required.

Colorless Tincture of Iodine.

We all have an occasional call for colorless tincture of iodine. Whichever method is used in making it, whether by neutralization with ammonia water or by the use of sodium hyposulphite, the result is an alkaline iodine salt. The first is hardly suitable for extemporaneous use, and the latter ultimately throws down a precipitate of free sulphur. A preparation equivalent to that made by either of these methods can be made in two or three minutes by making a 10 per cent. solution of the iodide of ammonium or of sodium in diluted alcohol.

Restoring Granulated Ointments.

Stock ointments which have become granulated—that is to say, there has occurred a separation of the olein and palmitin, leaving them unsightly but without rancidity—can be brought back to their original condition by simply melting them.

To Powder Camphor.

The usual method of powdering camphor in a small way is by means of alcohol. A better method is by means of chloroform, which because of the small quantity required to do the work, the rapidity of its evaporation and the greatly reduced price of chloroform, is well adapted for a "hurry-up" job.

Improving an Oil Atomizer.

Finally, if one ever has a call for an oil atomizer and has nothing but the water variety on hand, he should not lose a sale, but should take one of the latter kind, providing it has hard rubber pipes, and with the wire which comes with it previously made red hot, burn the opening in the tip so as to increase its bore slightly, when he will have what is wanted.

Mr. Davies manifests a spirit which calls forth great admiration on our part. There are doubtless many druggists like him who could report numbers of little wrinkles if they would only take the time to jot down on paper some of their ideas. We trust that a reading of Mr. Davies' contributions will spur them to take this action.

Our present contributor has our thanks not only for his notes, but for the manifestation of the "give and take" spirit which we have so often advocated in connection with this department.

"Venice Lime."—B. E., New York.—We had never known the term "Venice lime" before receiving your communication; and we are not able to find any other reference to it. It may be that you have confused "Vienna" or "Viennese" and "Venice"; "Vienna lime" and "Viennese lime" are names sometimes applied to Vienna powder or Vienna caustic, potassa with lime, U. S. P., 1890. The official directions for preparing this compound were to take equal parts by weight of potassa (potassium hydroxide) and lime (calcium hydroxide) and rub them together in a warm iron mortar so as to form a powder, which should be kept in well-stoppered containers.

Russell's Emulsion of Mixed Fats.—T. S., Pennsylvania.—We do not know how this preparation is made. In the CIRCULAR for June, 1907, page 419, is published a formula for a pancreatized emulsion of mixed fats, supplied by Prof. I. V. S. Stanislaus, who said that it was "used by a well-known manufacturing house in making a [so-called] nutrient emulsion." It is here reproduced:

Pancreatized Emulsion of Mixed Fats.

Oleomargarin (fresh).....	4 ounces.
Soap	350 grains.
Tragacanth, powdered.....	35 grains.
Benzoic acid.....	15 grains.
Glycerole of pancreatin.....	1 fl. oz.
Water.....	enough to make 1 pint.

Heat the soap with 4 fluid ounces of water until dissolved. Add the hot solution to the melted oleomargarin, mix by rapid agitation or trituration, add the tragacanth, continue agitating until a nucleus emulsion is formed, add the glycerol and the acid and make up to 1 pint with water.

Glycerole of Pancreatin.

The glycerole of pancreatin called for in the foregoing formula is made as follows:

Pancreatin	100 grammes.
Sodium bicarbonate.....	4 c.c. (mils).
Distilled water.....	200 c.c. (mils).
Glycerin.....	enough to make 1000 c.c. (mils).

Dissolve the sodium bicarbonate in the water, and dissolve the pancreatin in this solution. Then add the glycerin. Let the mixture stand in an open vessel for at least twenty-four hours, then filter and preserve for use.

Mathematics of Solution.—F. E. M., Massachusetts, asks: "If potassium iodide is soluble in 7/10 parts of water, how much will be required to make 1 fluid ounce of saturated solution of potassium iodide?"

How much of what, potassium iodide or water? But never mind that, as the question is not one that can be solved by mathematics, anyhow. If our querist wants to find out how much potassium iodide is required to saturate 1 fluid ounce (454.6 grains) of water, knowing that 1 grain is required to saturate 7/10 grain of water, the application of the rule of three will show him, pretty quick, that 0.7:1::454.6:649.4. Therefore, 649.4 grains of potassium iodide is required to saturate 1 fluid ounce of water. Just what the solution will measure, however, can be determined only by measuring it. Its weight will be that of the water and the potassium iodide combined, which is 1104 grains. It is an easy matter to ascertain (at least approximately) the weight of a carefully measured fluid ounce of the saturated solution, and this, with the data already at hand enables one to arrive at the desired figure.

Fat Off.—B. B. G., New York.—We do not know the composition of this preparation. We do know, however, that there are several notes in recent volumes of the CIRCULAR on fake and dangerous nostrums offered as fat reducers. Druggists should advise their customers who are over-provided with adipose tissue to consult reputable physicians and leave quacks and their remedies severely alone.

Bismuth a Possible Teniacide.—James A. Bethune, Maryland, writes.

Seeing the note on bismuth as a possible teniacide in the CIRCULAR for February, page 75, reminds me of an occurrence which I chronicled in my memorandum book as follows:

In 1882, while I was clerking for a drug firm in a small town in Virginia, a prominent young lawyer of the town brought to me some prescriptions, written by a very able physician and surgeon, for the relief of diarrhea; for some days the trouble was not relieved, and the physician then gave, as far as I can recall, say:

Pepsin	5j.
Bismuth subnit.....	5j.
Pulv. aromat.....	5j.

M. Ft. chart. No. XII.

Sig.: One every four hours.

After two or three hours the patient came to the store and asked for a vermifuge, saying he had passed a large worm.

Query: Did the pepsin digest the worm; or did the aromatic powder intoxicate the worm and loosen its hold?

Your note may show that it was the bismuth subnitrate that did the work.

This report from Mr. Bethune not only throws an additional light on the subject immediately under discussion, but it shows how even wise men sometimes stumble along in the work and happen to hit the right thing.

Hostelley's Wine of Cod Liver Oil.—T. S., Pennsylvania.—We do not know what the formula of this preparation is, but since you say that what you want to make is a wine of cod liver oil containing the chlorides of iron, arsenic and mercury, it would seem that the way to proceed would be to make a wine of cod liver oil according to any acceptable formula found in pharmaceutical literature, and add to it the desired proportions of the other ingredients. In this connection we call your attention to a note on the Waterbury preparation on page 567.

We understand that the claim is made that each teaspoonful of the preparation as turned out by Hostelley contains 21 minims of cod liver oil, 1/200 grain of arsenic chloride, 1/128 grain of corrosive mercuric chloride, 1/4 grain of ferrous chloride, and port wine and vegetable flavoring enough to bring the total up to the specified quantity.

Thompson's Emulsion of Linseed Oil.—C. D. C., New York.—When you sent your query you had not received a copy of the September issue of the CIRCULAR, on page 483 of which appears the formula requested.

However, the CIRCULAR for July, 1910, was available, on page 365 of which may be seen a formula for this emulsion, the proportions of the ingredients directed therein being slightly different from those given last month. Directions for making this preparation are printed also in the issues of the CIRCULAR for November, 1907, page 735, and August, 1904, page 179.

Those who keep their copies of the CIRCULAR on file and refer to them when in need of information, save themselves many annoying waits and prevent the loss of many sales.

Liquor Cresolis Compositus.—B. E., New York.—When you wrote, you had not received the September issue of the CIRCULAR, on page 477 of which appears a note that we believe you will find helpful. We suggest that you also read the note in the August issue, page 419.

Green Show Globe Color.—J. K., Illinois.—There is no dearth of formulas for show globe colors, green and other kinds, but as to which of these yield permanent colors only experiment can demonstrate, and these experiments, to be of the most value, should be conducted by the man, in the store, and with the materials that are to figure in the trial of the finished preparation. Some formulas follow, all being for green solutions:

I.

Verdigris 1 part.
Distilled water..... 9 parts.
Sulphuric acid..... enough.

Mix the verdigris with the acid, set aside for a few minutes, add to the distilled water, and filter.

II.

Copper sulphate..... 1 part.
Ammonia water..... 9 parts.
Water 240 parts.
Solution of potassium dichromate... enough.

Dissolve the copper sulphate in the distilled water, add the ammonia water and enough of a solution of potassium dichromate to give the desired tint, and filter.

III.

Copper sulphate 9 parts.
Hydrochloric acid..... 8 parts.
Water 84 parts.

Dissolve the copper salt in the water, add the acid and filter.

IV.

Copper sulphate..... 7 parts.
Ammonium chloride..... 7 parts.
Water 186 parts.

V.

Nickel 85 parts.
Hydrochloric acid..... 132 parts.
Nitrous acid..... 55 parts.
Water 4,000 parts.

Dissolve the nickel in the hydrochloric acid, add the water, then the nitric acid, and filter.

Olive Green.

Copper sulphate..... 35 parts.
Hydrochloric acid..... 16 parts.
Iron subcarbonate..... 4 parts.
Water 450 parts.

Dissolve the copper sulphate in the water and the iron in the acid; mix the two solutions, and filter.

Pea Green.

Nickel 1 part.
Nitric acid..... 4 parts.
Water 495 parts.
Solution of potassium dichromate... enough.

Dissolve the nickel in the nitric acid, add the water and enough of solution of potassium dichromate to give the desired color.

An interesting article on the origin and use of colored show globes in apothecary shops appears in the CIRCULAR for March, 1910, page 133.

Rat and Roach Pastes.—G. C. S., Kentucky.—Formulas for phosphorus rat and roach pastes appear in the issues of the CIRCULAR for April, page 179; October, page 517; and November, page 577, all for last year.

Cloudy Syrup of Hypophosphites.—G. A. L., Ohio.—Much experimentation and study have been devoted to perfecting a formula for a compound syrup of the hypophosphites that would stay clear. Not only from the standpoint of elegance is a clear preparation desirable; there have been fatalities attributed to an overdose of strychnine taken in a cloudy syrup. Crystals of the alkaloid will sometimes form and adhere to the bottle, and may become dislodged afterward and so enormously increase the quantity in a later dose, and the same result occurs when an amorphous precipitate may not be diffused by always shaking before using.

Faulty manipulation is responsible for most of the cloudy specimens of the official syrup whose makers come to us for relief. We do not care to advise the marring of the official process and therefore we offer the following formula which according to the Standard Formulary produces a cloudy syrup:

Calcium hypophosphite..... 180 grains.
Sodium hypophosphite..... 60 grains.
Potassium hypophosphite..... 30 grains.
Iron phosphate, soluble..... 15 grains.
Manganese hypophosphite..... 15 grains.
Quinine sulphate..... 5 grains.
Strychnine sulphate..... 1 grain.
Distilled water..... 4 ounces.
Syrup..... enough to make 1 pint.

Heat the solids with the water until dissolved; add the syrup, heated to boiling; boil for a few moments, stirring constantly, and strain.

The cloudiness of the product was the cause of much dissatisfaction with the formula for syrup of hypophosphites with iron of the 1890 Pharmacopœia. Perhaps there may be something of interest in the note on Tscheppe's formula for syrup of hypophosphites in the CIRCULAR for April, 1910. Physicians who express a preference for a cloudy syrup should be told of the risks its use entails.

The Manufacture of Chloralformamidum.—E. O. S., Connecticut, asks if we can explain why there is only one make of chloralformamidum on the market. We can not. That is a question for the chemical manufacturers to answer. The product was patented in this country in 1890, and as the life of a patent is seventeen years, presumably the patent was still in force when the product became official upon the adoption of the eighth revision of the United States Pharmacopœia some six years ago. Why manufacturers other than the patentees have not put their own makes of this chemical on the market, we repeat that we do not know.

Etching on Steel.—C. E. D., Pennsylvania.—Letters or designs may be etched on steel tools with almost any strong acid, as nitric, for instance. The process consists of covering the portion of the tool to be etched with a thin film of wax, marking the design on and through the wax, and then applying the acid to the portions of the steel thus denuded.

Of course some precautions must be taken to protect all other portions of the metal from the corroding influence of the acid, and also to see that the design is graven in the wax in a uniform manner, so that the etching will appear neat and even when completed.

Lice on Poultry.—F. G. S., Indiana.—Bulletins on many subjects of particular interest to pharmacists are issued by the United States department of agriculture, and we have frequently urged our readers to take advantage of the opportunity thus afforded them to get for little or nothing books and pamphlets of much value. A few years ago Nathan Banks, of the bureau of entomology of the department prepared a paper on "Mites and Lice on Poultry," which was published as Circular No. 92. In this pamphlet are descriptions and illustrations of all the insects which infest hens, together with directions for preparing and applying remedies and preventives. Extensive quotations from the pamphlet are given in the CIRCULAR for April, 1910, page 173. Portions of another government bulletin on the subject are reprinted in the CIRCULAR for April, 1909, page 192. Regarding a powder to rid hens of lice, the first-mentioned pamphlet says: "Sulphur mixed with air-slaked lime, 10 pounds of sulphur to a half bushel of lime, is also often used against lice. This may be scattered everywhere in the house, or mixed in the dust wallow."

Recently the CIRCULAR has printed the following formula:

Crude carbolic acid.....	1 pint.
Carbon disulphide.....	1 ounce.
Oil of tar.....	1 ounce.
Coal oil.....	4 ounces.
Sawdust	enough.

Mix the liquids and add as much sawdust as the mixture will saturate.

This powder freely strewn about the nests of hens will rid them of objectionable insects.

In another recent issue of the CIRCULAR a poultry louse powder containing equal parts of naphthalin, sulphur and tobacco is mentioned.

Some references to means to be used against other kinds of lice may be found on page 567. Perhaps suggestions made there may be useful in connection with the subject, which is herein under discussion.

Beauty Prescription Fakes.—New Jersey.—It is said that a mixture of two parts of alum and one part of epsom salt can not be distinguished by chemists from *saxolite*.

Elsewhere in this issue (page 574) we have a note on mercolized wax; and in the CIRCULAR for January, 1910, page 26, are notes on *almazoin* and *spurmax*, with formulas. The former is said to consist of tragacanth, borax and magnesium carbonate, and the latter to be simply epsom salt, colored and perfumed.

The saying that there is a sucker born every minute must be substantially true, else how would the people who put these things on the market get along?

Salicylic Acid plus Sodium Bicarbonate.—W. E. B., Maine.—When salicylic acid and sodium bicarbonate are brought together in solution, sodium salicylate is formed and carbon dioxide is liberated. Excess of alkali, or even the oxygen of the air, will darken the mixture.

Inventory Sheets for Druggists.—G. A. M., New Jersey, asks where he can buy these. As we are unable to answer him, we pass the question along to our readers.

Improving Official Directions.—F. W. Scott, Jr., New York, has favored CIRCULAR readers with many good formulas and practical notes, and to show that he has not lost interest in such things he now sends us the following:

Stokes' Expectorant.

The National Formulary directs in making Stokes' expectorant that to the neutralized fluidextract of squill, be added, in order, the fluidextract of senega, the camphorated tincture of opium and the solution of ammonium carbonate, and then sufficient syrup of tolu to make the required volume. I obtain a much more satisfactory preparation, and one that requires a less careful shaking on dispensing, by mixing the ingredients in this order: To the neutralized fluidextract of squill, add the fluidextract of senega and camphorated tincture of opium; mix well and add sufficient syrup of tolu to make 850 c.c. (mils). When this is well mixed, add the solution of ammonium carbonate and sufficient syrup of tolu to make 1000 c.c. (mils). Mix well.

And now while we are talking about mixture we might improve on the method of preparing U. S. P. rhubarb and soda mixture. If we proceed as directed in the Pharmacopœia much of the oil in the spirit of peppermint will separate and the fluidextracts will precipitate to a great extent. If, however, we follow the directions below the trouble will be lessened. To the glycerin add in order the spirit of peppermint, the fluidextracts, and water enough to make 550 c.c. (mils), shaking after each addition. Dissolve the sodium bicarbonate in enough water to make 450 c.c. (mils) and add this solution slowly during constant stirring to the first mixture.

We feel sure that our readers join us in thanking Mr. Scott for this renewed manifestation of his belief in the "give and take" policy of this department of the CIRCULAR, and also that the committee of revision of our two official books will give due consideration to his suggestions.

Pharmaceutical Notes.—Otto Raubenheimer, New York, who may always be depended upon to find out something about almost any pharmaceutical subject that would escape the attention of the casual observer, favors us again, writing what follows:

Mullein Oil.

As a semi-homœopathic pharmacist, permit me to make a few remarks on this subject, touched upon in the CIRCULAR for September, page 476. A most interesting account of the history of mullein oil is given in New, Old and Forgotten Remedies, a compilation of papers by many writers, by E. P. Anshutz, published by Boericke & Tafel, Philadelphia. Mullein oil was introduced into homœopathic medicine, as a specific against deafness, by Dr. A. M. Cushing, in 1884, after his father, "whose house was the home for all poor tramps, as well as ministers," had been cured by one application of it.

The original method of preparation is given as follows: Fill a bottle with the blossoms of *Verbascum thapsus*, cork tight and hang in the sun for four or five weeks. By that time there will be an oily liquid distilled [O.R.]. Mix with 10 per cent. of alcohol. It is evident that the yield by this process is but trifling. And very likely for this reason the so-called mullein oil is to-day a tincture.

The American Homœopathic Pharmacopœia III is silent on the preparation of mullein oil. But the homœopathic authority of the world, the Pharmacopœia Homœopathica Polyglotta, by Dr. Willmar Schwabe, gives the following method for the preparation of the new so-called mullein oil:

"*Verbascum ad usum externum*: The fresh herb of *verbascum thapsiforme*, collected at the beginning of flowering, is pounded to a pulp and is then macerated with 4 parts of 90 per cent. alcohol during fourteen days, agitating three times daily. Then express and filter. Physical characteristics: reddish-brown color and slight aromatic odor and taste."

Yellow Tinted Compound Syrup of Hypophosphites.

Permit me to point out that your South Carolina correspondent (September, page 476), is unnecessarily alarmed

about the yellow tint in this syrup. Compound syrup of hypophosphites, according to the present U. S. P. process, as well as according to former N. F. process, has a yellow or golden-yellow color. This is due to the solution of iron and manganese hypophosphites in sodium citrate. I do not agree with your statement that "the yellow tint of the finished syrup is doubtless an indication of the change of some of the ferric salt into the ferrous state," as the iron in this preparation is in the ferric state [which is probably not true of the preparation referred to by our South Carolina friend who stated that his solution of iron and manganese hypophosphites was "rather dark" and not "clear greenish" as it is described in the Pharmacopœia.—Editor THE DRUGGISTS CIRCULAR.]

This query as to the color of compound syrup of hypophosphites again strengthens my belief in the advisability of adding physical descriptions to the monographs of the galenical preparations of the United States Pharmacopœia in a great many instances. Such a simple description as yellow color and bitter taste would readily help to differentiate the compound syrup from the plain, which could be described as colorless and sweet. This would be a help to the pharmacist as well as to the physician, and the latter, I am sorry to state, is almost entirely ignorant as to the physical and chemical characteristics of the U. S. P. preparations which he prescribes or, at least, which he should prescribe.

In connection with this I might also call the attention of your readers to the fact that the compound syrup of hypophosphites should be kept in the dark, or at least away from the light, as direct light will in time bleach it so as to render it almost colorless. This has been my own experience (and, after all, experience is the very best teacher) in displaying bottles of this syrup and exposing them to direct light. Undoubtedly the manufacturing houses for this very reason put up this syrup in amber bottles or in bottles wrapped in paper.

The most that we can say about Friend Raubheimer is that we wish there were more like him—more readers of the notes in this department who are givers-and-takers.

Why, When and How Queries Are Answered.—For the benefit of a number of readers who have requested answers to their queries by letter, which requests, as much as we should like to grant them, we have been obliged to deny, we again call attention to the standing notice at the head of this department. And to show all our friends that we are not arbitrary or unreasonable about this matter we are reproducing a portion of an editorial article published in the CIRCULAR a few years ago:

As a courtesy to the individual querist, and for the purpose of making the columns of his paper more helpful to all his readers by discussing therein those questions which actually have presented themselves to one or more of them, the editor is glad to give in the paper such answers to all proper pharmaceutical queries as he knows or can find, and to help to discover, by giving the queries publicity, the answers to such questions as he can not locate by other means at his hands. All our unanswered queries are kept in a special drawer, and we make it a point to empty this drawer, if possible, on the fifteenth of each month. As we pen these lines, on the sixteenth, there are in this drawer, out of the hundreds of letters or cards requesting information that have reached us this year, only three that have not been disposed of, and steps looking to a proper disposition of these have been taken.

It very frequently happens that before he can answer a given question the editor must refer to authorities or search records which are not within easy reach. Perhaps the desired information is at Albany, or Washington, or in the subscriber's own State a thousand miles from New York, or it may be that the answer to the query is dependent upon chemical changes in some mixture which do not take place at once. So even if the undivided time of the editor were at the command of the individual querist, it is manifest that it would be impossible for him to reply by return mail, or even, in many instances, in the next issue of the paper.

But the duties of an editor are manifold. He can not

devote his whole time to answering queries, any more than he can devote his whole time to reading proofs, finding fault with the printer, writing letters to modest pharmacists who have to be urged to send their photographs for reproduction, or preaching little sermons to unreasonable and impatient querists. When the editorial staff of the CIRCULAR has done all the things mentioned, together with a thousand and one others, from a recitation of the harrowing details of which we feel that our innocent readers are entitled to protection, it is time for the CIRCULAR to go to press; and thirty days is an all too brief period in which to go through all this again, with variations, for the next month's issue. That is why we keep a notice standing at the head of our Notes and Queries department to the effect that queries to be answered in the issue of the paper for a certain month should reach us before the middle of the previous month. But no guaranty goes with this notice that if the query reaches us before the fifteenth it will be answered in the issue for the succeeding month.

As to answering queries by letter, not only do we refrain from doing this for the reason set forth in that aforementioned standing notice, to wit, that our answers are for the information of our readers generally and not for the exclusive use of any individual, but for the further reason that if we took the time to answer queries by personal letter we not only would not be able to fill our Notes and Queries department with the interesting matter that goes into it each month, but would have no time to devote to the various other departments which help to make the CIRCULAR welcome in the drug stores of the land.

Now, let no reader of the CIRCULAR, be he proprietor or clerk, think for one moment that we are not pleased at receiving his query, and still more pleased when we think our answer will be of service to him and to pharmacists generally. We want to receive queries, not only for the good that may come to pharmacy from a discussion of the points which these queries raise, but for the selfish reason that they make our paper of more value to our readers and consequently to ourselves. The man who writes on a postal card and demands an answer by return mail is a little bit worse than the modest fellow who prefaces his request for help by the statement that he has been a subscriber seventeen years and has never "bothered" us before, when it is our delight to be "bothered," but each one would make us say things if it were not for the fact that long tenure of our position and the cultivation of the patience and humility that goes with it had taught us how vain and profitless it is for one to allow his baser feelings to rise high enough to sway his actions.

To each "dear reader" of the CIRCULAR we would say: Send in your queries and we will answer them if we can, when we can; but if you do not receive your reply as quickly as you wish or think you ought, please try to give us credit for honorable intentions, and rest assured that there is some good reason for the delay.

Or, to put the whole matter of answering queries by letter in a nutshell, we may quote from another editorial article which appeared in this journal: "The CIRCULAR is a periodical for the many, not a correspondence school for the few."

Artificial Oil of Sassafras.—A. S., Pennsylvania.—The better grade of artificial, or synthetic, oil of sassafras is safrol; but more commonly the "artificial" oil is oil of camphor fractionated to simulate oil of sassafras in specific gravity and containing only about two-thirds as much safrol as does the natural oil. Oil of camphor is a by-product in the manufacture of camphor and rather inexpensive. It contains all the constituents of oil of sassafras, although in different proportions.

Dental Modeling Wax.—M. L., New York.—Without attempting to have a chemical analysis made of the sample you send—the general interest in the matter hardly justifying that expense—we would say that it appears to us to consist of a mixture of beeswax and paraffin, tinted, with some red anilin dye perhaps.

Phenol Gangrene.—Thomas Latham, New York, favors us with the following observations on the danger of applying phenol solutions to cuts and bruises:

Referring to the article, "Another Case of Phenol Gangrene," on page 410 of your August number, I would say that the case mentioned must have happened by an infringement of the New York board of health ordinance, now several years in force, prohibiting the sale of phenol in solution stronger than 5 per cent.

In the hands of pharmacists the phenol liquefactum of the Pharmacopœia may be further diluted to any desired strength, but in the hands of laymen, even those who have had a course in "first aid," it is a dangerous substance. Its further dilution, especially in cold weather, is a matter of difficulty when water drawn from a hydrant is 50° or lower. The phenol is probably dropped into a convenient open vessel and the proportion guessed at. A bandage is saturated and doubtless takes up some of the oil-like drops of the 90 per cent. phenol with damaging results to the wound. Still phenol liquefactum 5 per cent. will continue to be a popular article, and the popular opinion that a few drops in some water is good for cuts and wounds will hold.

I had hardly finished reading your article when I dispensed, on a physician's prescription, 200 c.c. (mils) of a 1 in 60 solution for a thumb from which a large needle had been extracted, so you see the medical profession still thinks well of phenol.

Thirty-five years ago I applied it, 90 per cent., to the suppurated wound of an ingrowing big toe nail several times. It gave instant relief to the burning and pain, and rapidly induced healing. According to present opinion I should have lost my toe, but it is still in good working order, doing its fifteen hours per day.

Perhaps the chief reason for the extensive use of the saponated cresols is their ready solubility in water, and because the presence of the soap has taken from them their "bite."

I do not find that the manufacturers of "first aid cabinets" include phenol in their contents, nor do jobbers offer phenol liquefactum, so the guilty ones must be retail pharmacists outside of Greater New York, where, as before said, the sale of phenol, of greater strength than 5 per cent. is prohibited. Surely no one in the city would break such a wise and beneficent ordinance.

The tendency to gangrene appears to vary greatly in different individuals. What would be a dangerous strength in one case would be safe in another. Many of the finger injuries are crushings where the natural structure of the flesh is destroyed. But this is a surgical not a pharmaceutical subject.

The fact that most of us breathe or eat the germs of tuberculosis, typhoid fever and other dangerous diseases every now and then, and only a comparatively few of us develop the corresponding trouble, does not prove that contact with these germs is beneficial or even harmless. In the CIRCULAR for August, to which Mr. Latham refers, two cases of gangrene following the application of phenol dressings are reported; in the issue for March, 1908, page 115, five cases; and in the July number, 1907, page 468, nine. It should be understood that the CIRCULAR does not make a specialty of collecting and publishing data on this subject, and does not pretend that its references are anything like complete, yet a hurried glance through its files for the past score of years, shows that it has reported cases of gangrene following the application of phenol, as here indicated; 1892, November, page 251, a general warning, with no specific case given in detail; 1895, August, page 182, two cases; 1900, November, page 217, eighteen cases mentioned; 1902, one case, in which the amputation of a leg followed the accidental spilling of the solution on the victim's foot; 1904, September, page 200, Dr. Harrington refers to records of 132 cases; November, page 247, one case; 1905, April, page 115, one

case; November, page 390, one case; December, page 431, one case. All these are in addition to the more recent ones above mentioned, and in many of them the solution used was about 5 per cent., and in some of them it was as low as 1 or 2 per cent. It would seem from this that the New York city ordinance restricting phenol sales to solutions of not over 5 per cent. does not have the effect ascribed to it by our correspondent.

We thank Mr. Latham for his contribution to the subject, for although, as he says, this is a surgical rather than a pharmaceutical subject, still druggists have an interest in it, especially as one of their number in this city was taken to court some years ago to answer a suit for damages growing out of the loss of a thumb attributed to a phenol dressing applied by a clerk in his store.

Corn Collodion.—B. C. M., Indiana.—In the National Formulary may be seen a formula for a corn collodion containing the very ingredients you name—Indian hemp, salicylic acid and collodion.

Under the federal food and drugs act (which applies only to interstate traffic and sales in certain territory under the jurisdiction of the United States government but not in any sovereign State), a drug is misbranded if the label on the package in which it is put up fails to bear a statement of the quantity or proportion of any alcohol, morphine, opium, cocaine, heroine, alpha- or beta-eucaine, chloroform, cannabis indica, chloral hydrate or acetanilide, or any derivative or preparation of any such substances contained therein. While the federal law does not apply to sales made entirely within a State, it should be borne in mind that most of the States have food and drugs acts of their own. The Indiana law contains a clause similar to the one just quoted from the federal act.

Viavi Cerate.—R. C. New York.—In the *California State Journal of Medicine* for April, 1907, is a long article devoted to exposing the humbuggery of the viavi people. An abstract of this article appears in the *Journal of the American Medical Association* for April 27th, 1907; and more on the subject appears in the issue for June 15th following. This abstract and additional matter has been published in book form, together with similar exposures of scores of other medical fakes in a little volume of about 300 pages. This book will be found extremely interesting to druggists, and as it will be sent post-paid on receipt of 10 cents in stamps by the American Medical Association, 535 Dearborn avenue, Chicago, there is no reason why a copy should not be in every drug store in the land.

In this exposure, reference is made to a viavi preparation consisting of cacao butter and extract of hydrastis.

Cuticura Resolvent.—C. S., Mississippi.—We do not know what the composition of this preparation is. Many years ago there went the rounds an alleged formula which was as follows:

Aloes	1 dram.
Rhubarb	1 dram.
Potassium iodide.....	36 grains.
Whiskey	1 pint.

Macerate over night and filter.

Mercolized Wax.—J. W. L., Pennsylvania.—This alleged aid to beauty has been examined by F. W. Nitardy, of the Colorado food and drugs bureau, who reports that he found in it ammoniated mercury, zinc oxide, and something having the appearance of a combination of white wax and a mineral oil. He also discovered a trace of perfume.

It seems to be another one of the various fakes whose sale in drug stores does so much to prevent pharmacists from receiving the recognition to which practitioners of a branch of the healing art are entitled.

Liquid Peptonized Foods.—S. C., Michigan.—An article on this subject, embracing many formulas, appears in the CIRCULAR for April, page 197.

Oxygenated Tooth Powder.—B. L., England.—A note on this subject, with a formula, appears in the CIRCULAR for July, page 354.

Anonymous Queries.—"Douche Powder," New York.—Your attention is called to the standing notice at the head of this department in which it is stated that queries, to be answered by us, must be accompanied by the name and address of the writer. Not only do we keep that notice standing, but every once in a while we print a note similar to this one, calling special attention to it; and now and then we give our reasons for having made such a rule.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Saratoga Ointment.—F. R. S., Iowa.

Universal Balm.—G. F. D., Massachusetts.

Camphorated Rhubarb.—C. H. J., Maryland.

Inventory Sheets for Druggists.—G. A. M., New Jersey.

Veterinary Spavin Liniment.

The following is from a German source:

Tincture of iodine.....	4 parts.
Tincture of myrrh.....	4 parts.
Oil of turpentine.....	6 parts.
Tincture of cantharides.....	2 parts.
Alcohol	4 parts.

Make a mixture.

Solder for Platinum.

Fine silver.....	125.0 parts.
Brass	12.5 parts.
Alloy copper.....	12.5 parts.

Fuse together the brass, the copper and 50 parts of silver. When this alloy has been made and cooled, melt it with the rest of the silver.

No, Isabel, invisible face powder is not one intended to make the face invisible; although from the appearance of some women it would seem that they really use face powder for that purpose.

B wins. The poison was to be used on gophers, and not, as A contended, on golfers.

Some British Formulas.

In the third report of the committee of reference in pharmacy, made to the pharmacopœia committee of the (British) general medical council, were a number of suggestions for changes in the formulas of the British Pharmacopœia. These were given in a recent issue of the *Pharmaceutical Journal and Pharmacist*, of London, from which the following are reprinted:

Liquor Epispasticus.

Blistering Liquid.

Cantharidin	1 part.
Castor oil.....	6 parts.
Rosin	3 parts.
Acetic ether (or acetone).....	240 parts.

Make a solution.

Mistura Olei Ricini.

Castor Oil Mixture.

Castor oil.....	75 parts.
Powdered acacia.....	20 parts.
Orangeflower water.....	30 parts.
Cinnamon water....	enough to make 200 parts.

Triturate the oil with the acacia in a dry mortar; add, in one portion, 40 parts of cinnamon water, and continue the trituration until the oil is completely emulsified; then add the orangeflower water and the rest of the cinnamon water.

Suppositoria Glycerini.

Glycerin Suppositories.

Gelatin	14 parts.
Glycerin (by weight).....	70 parts.
Distilled water.....	enough.

Soak the gelatin in distilled water until it is thoroughly softened; add the glycerin; make a solution on a water-bath; and evaporate until the mass weighs 100 parts.

Dangers of Poppy-Head Soothing Drafts.

A circular has been issued by the French minister of agriculture, addressed to the local authorities throughout the country, advising them that poppy-heads have been added to the official schedule of poisons. In part the circular reads (*Chem. and Drug.*): "There is no doubt that the practice [existing in certain parts of France] of administering poppy-head decoction to infants as soothing syrup, without a medical prescription, presents serious dangers from the point of view of public health; that it is well proved to have already caused many deaths, and to be one of the causes of the high rate of infantile mortality in northern France."

Honey and Glycerin Jelly.

Soft soap.....	1 ounce.
Honey	3 ounces.
Glycerin	4 ounces.
Olive oil.....	20 ounces.
Almond oil.....	20 ounces.
Oil of rose.....	40 minims.
Distilled water.....	4 drams.

Mix the water, the glycerin and the honey, and dissolve the soap in this mixture. Mix the oils and add them gradually in an uninterrupted stream to the first mixture, triturating vigorously the while.

Alabama Board Questions.

Herewith is reprinted a set of questions used by the Alabama Board of Pharmacy at an examination held May 15th. Another set of questions used by this board appears in the CIRCULAR for June, 1910, page 286.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give to our readers, just as nearly as practicable, the questions as they were presented to the candidate.

Pharmacy.

L. C. Lewis, Examiner.

1. Define heat. What three degrees of heat for thermometers are used? Which is used in the U. S. P.? What is the standard temperature for taking specific gravity? What is gentle heat?
2. What is a water bath? How may the boiling point of a liquid be obtained? Name and explain the different degrees of fineness of powders as designated in the U. S. P.? What is meant by pulverization by intervention?
3. What is meant by circulatory solution? Name the principal solvents used in pharmacy according to their importance? Name five official tinctures with the percentage of drug which are made by maceration.
4. Why is maceration preferable to percolation in these cases? Describe the official process of percolation.
5. Name five U. S. P. tinctures and state per cent of drug whose menstruum is a mixture of alcohol, glycerine and water.
6. What is the difference between a sediment and a precipitate? Name some terms employed to define the peculiar form which precipitates assume. How are heavy precipitates formed? What advantage have they over light ones?
7. Give formula *Liquor Ferri et Ammonii Acetatis*? How does it differ from the U. S. P. 1890? What precautions are necessary in its manufacture to insure a clear product? Give common name.
8. What advantages are Oleates supposed to have over the ointments? Name three Oleates with percentage of active drug. How do waxes differ from true fats? In what respects do Oleoresins differ from Fluid extracts?
9. How do the ointments of Phenol and sulphur of the U. S. P. 1900 differ in strength from those of 1890? Give formula of *Syrupus Scillae* and *Syrupus Scillae Compositus*.
10. Give formula of: *Pulvis Effervescens Compositus*; *Pulvis Acetanilidi Compositus*; *Pulvis Cretae Compositus*. Name the ingredients in *Extractum Colocynthis Compositum*? Into what official preparations does it enter?

Chemistry.

Sam A. Williams, Examiner.

1. Define a chemical change. (b) How does chemical affinity differ from other forces? (c) Define atomic and molecular weight. (c) Define valence.
2. Define the term reagent. (b) What is qualitative analysis? (c) Quantitative analysis? (d) What is meant by allotropic modification? Give example.
3. What is an element? A metal? Give the names, chemical and physical properties of the elements composing the group known as the halogens.
4. How does chlorine act as a bleaching agent? Give tests for hydro-chloric acid and chlorides. Mention test by which iodine and iodides may be recognized.
5. Mention some metals found in nature in uncombined state. Some as oxides, sulphides and carbonates.
6. Give symbol, atomic weight and valences of five elements.
7. State chemical name and composition of common salt. Glauber salt. How can commercial bi-carbonate soda be purified? What is calcined magnesia? How is Epsom Salts made? Give official name.
8. Mention two processes for making zinc oxide. What is an alloy? What is sub-nitrate and sub-carbonate of Bismuth? How made from metallic Bismuth?
9. Name tests by which the organic nature of a compound may be determined. By what test may the pres-

ence of hydrogen be known? How does heat act upon organic compounds? What are the chief groups of organic compounds?

10. Mention two hydro-carbons. Two alcohols. Two aldehydes. Give their physical properties.

Materia Medica.

W. E. Bingham, Examiner.

1. (a) Give official name of aconite. (b) What part of plant is used in Medicine? (c) What effect on tongue when tasted? (d) Name official preparations. (e) Dose of the Tincture. (f) Has the strength of the Tincture been increased or decreased in the last pharmacopœia?
2. Name four official preparations of metallic mercury and give the percentage of mercury in each.
3. (a) Describe ointments, plasters, cerates. (b) How do they differ? (c) Name two official preparations under each head.
4. (a) Name five compounds containing oxygen. (b) What is the difference between oxygen and ozone? (c) What is oxidation? (d) What is hydrogen?
5. (a) What plant yields hyosciamus? (b) Give habitat and natural order. (c) What part of the plant constitutes the official drug? (d) What percentage of alkaloid should it contain? What alkaloid is obtained from it? Name the principle salts obtained from the alkaloid.
6. (a) What is the official name of Benzoin? (b) Botanical origin and constituents? (c) Where and how obtained? (d) In what is it soluble? (e) Medicinal properties?
7. (a) What is the common name of *Oleum Tigllii*? (b) Botanical origin? (c) Is it a fixed or volatile oil? (d) Physiological action and medicinal properties?
8. (a) Give common name of *Terebinthina*. (b) Is it a fixed or volatile oil? (c) How obtained? (d) Name the official preparations. (e) Physiological action. (f) What is *Terebene* and *Terpin Hydrate*?
9. (a) Give common name of *Physostigma*. (b) Part used and natural order? (c) What two alkaloids does it contain? (d) Official preparations?
10. Give official names of the following: (a) *Gray Powder*. (b) *Spirits mindereris*. (c) *Bashams mixture*. (d) *Meadow Saffron*. (e) *Cochineal*. (f) *Black Wash*. (g) *Cotton*. (h) *Hops*. (i) *Honey*. (j) *Black Pepper*. (k) *Cascara Sagrada*. (l) *Lard*.

Toxicology, Posology and Pharmaceutical Arithmetic.

W. P. Thomason, Examiner.

1. Define Toxicology, Antagonist, Corrosive, Narcotic.
2. What are the symptoms of, and what emergency treatment should be employed for poisoning by Oxalic Acid? (a) Should the stomach tube be employed and should alkaline carbonates or bicarbonates be employed? Explain.
3. Name three unrelated mineral emetics, with dose of each. (a) Name three unrelated poisonous alkaloids, with dose of each. (b) Name five poisonous tinctures, with dose of each.
4. Name the best physiological antidotes, with their antidotal doses, and your method of administration in poisoning by Aconitine; by Morphine; by Strychnine.
5. What are the poisons in Schedule "A" of Alabama Pharmacy law, and what is required of the Pharmacist when selling them?
6. What is the dose of tincture of Aconite? Compound Tincture Catechu; Tincture Colchicum seed; Tincture of Ipecac; and Opium. Chloral Hydrate. Extract *Nux Vomica*.
7. How many grains of Mercuric Chloride are required to make two fluid ounces of a solution, one drachm of which diluted to one half pint would make a 1 grain to 2000 M solution?
8. If two lots of Cinchona, one consisting of 500 lbs. contains an average of 3 3-10 per cent. of Quinine, the second consisting of 300 lbs. containing 2 1-10 per cent. of Quinine, what is the Quinine strength of the product obtained by mixing the two lots?
9. How would you obtain the per cent. of Alcohol by volume in Squibbs Diarrhoea Mixture, formula of which is as follows?

Tr. Opium	6 fluid drachms
Tr. Capsicum	3 fluid drachms
Spir. Camphor	6 fluid drachms
Chloroform	2½ fluid drachms
Alcohol Q. S.	4 ounces

Show how you would estimate the Opium and Chloroform contents per fluid ounce of this preparation.

10. Give the units of Measure, capacity and weight in the metric system, and their equivalents in ordinary measures.

Notices of Books Received.

ORGANIC CHEMISTRY FOR THE LABORATORY. By W. A. Noyes, Ph. D. Second Edition Revised and Enlarged. Octavo; cloth; xi + 291 pages, illustrated. \$2. Easton, Pa.: The Chemical Publishing Company. 1911.

This second edition of Noyes' Organic Chemistry contains new chapters on the analysis of organic compounds, on ethers, hydroxy and ketonic acids, general operations, and carbohydrates. The text has been rearranged and a number of the tables have been recalculated. One hundred and thirty-one subjects are covered in the contents.

In preparing this work the author's stated purpose has been to afford a means toward personal experience, on the part of the beginner, with the basic processes of organic chemistry. He has also endeavored to aid the advanced student in obtaining an intelligent grasp on the voluminous handbooks. In both aims he has been quite successful.

A CONCISE HISTORY OF CHEMISTRY. By T. P. Hilditch, B. Sc., A. I. C. Duodecimo; cloth; ix + 263 pages, sixteen diagrams. \$1.25. New York: D. Van Nostrand Company. 1911.

As a brief outline of the historical development of chemistry this book will appeal to the student, teacher, and author interested in any of the many phases of chemical practice. Arising in the dark humble cell of the alchemist, nurtured by peasant, priest, and prince, to wield an influence in practically every walk of present-day life, chemistry has a most interesting history. From its earliest days it has been closely allied to pharmacy, and apothecaries and pharmacists loom large in the records of its growth.

And so it is that pharmacists will be among those most deeply interested in the little synoptic history titled as above.

PROCEEDINGS OF THE NEW JERSEY PHARMACEUTICAL ASSOCIATION, at the Forty-first Annual Meeting held at Asbury Park, June 14th to 16th, 1911.

PROCEEDINGS OF THE TEXAS PHARMACEUTICAL ASSOCIATION at the Thirty-second Annual Meeting Held at Dallas, June 20th to 22d, 1911.

Learning to Think.

Speaking of examination questions that befuddle pharmacy graduates, THE DRUGGISTS CIRCULAR quotes a question which stumped one proud young Ph. G. It was, "Is there any difference between the weight of a pound of cotton and a pound of lead?" From his failure a moral is drawn which reflects severely on the colleges who send out this sort of material, presumably ready to compound prescriptions.

For our part, we can't imagine how a chap of this sort would even get into any sort of a college of pharmacy—to say nothing of getting out of it whole.—*New Idea.*

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Advantages of Sunday Closing.

Near-the-River, August 28th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Herewith is a contribution which treats of a subject that is more and more becoming of intense interest to every pharmacist. I have endeavored to make the treatment both original and interesting. From editorials in your paper I am sure you are in favor of Sunday closing, as I indicate it in my article, and I trust that you will publish this appeal.

DRUG CLERK.

[The "appeal" follows.—Editor THE DRUGGISTS CIRCULAR.]

The Drug Clerk on the Witness Stand.

Q. What is your business?

A. I am a retail drug clerk.

Q. Are you a licensed clerk?

A. I am.

Q. Tell us how you acquired that license.

A. I acquired the license by passing an examination before the board of pharmacy in the subjects of pharmacy, chemistry, materia medica and toxicology. Before I was permitted to take that examination I had to sign a sworn statement that I had been employed in a retail drug store for at least four years, and that I was a graduate of a standard college of pharmacy. All States do not require that the applicant be a college graduate.

Q. What are your duties?

A. I fill physicians' prescriptions, prepare pharmaceuticals of all descriptions, sell drugs and medicines, poisons and non-poisons, wash cases and windows, dust, sweep—in fact, do all kinds of work.

Q. What are your hours of work?

A. They vary. My longest day is from 7:30 A. M. to 10:30 P. M. My shortest is the day I am "off" for the afternoon.

Q. Do you work Sundays?

A. Every other Sunday from 8 A. M. to 10 P. M.

Q. What is your salary?

A. Eighteen dollars per week.

Q. Is that the average salary?

A. Above the average in small stores. There are many clerks who can be hired to do the same work for from ten to fifteen dollars.

Q. What is a qualified assistant?

A. He is one licensed after examination by the board of pharmacy to fill prescriptions and sell poisons, but not legally qualified to take charge of or operate a drug store.

Q. What salary do they receive?

A. They can be had for from seven to eight dollars per week.

Q. Why are drug stores open so late at night?

A. Theoretically to attend to emergencies; practically to make money.

Q. Why are drug stores open on Sunday?

A. For the same reason that they are open so late on week days.

Q. Do you sell anything but medicine and sick-room necessities on Sunday?

A. We sell anything we have in the store that is sold on week days.

Q. Name a few items.

A. We sell candy, tooth brushes, soap, combs, brushes, soda water, cigars, etc., etc.

Q. If any other merchant opened his store Sunday for the sale of soap, combs, tooth brushes, etc., would not such merchant be considered a violator of the Sunday ordinance?

A. I believe he would.

Q. Is there any reason for a druggist to be permitted to

violate a law which another merchant would be arrested for violating?

A. I can see none.

Q. If the druggists are to be permitted to have a "wide-open" Sunday business cannot all merchants claim an equal right?

A. It would seem so.

Q. Is it true that it is absolutely necessary to the health and happiness of the nation for the drug store to be open all day Sunday, that it may minister to the needs of the sick?

A. To say so would be to make a very bold claim.

Q. Can it be proven in any way that it would be a tremendous hardship to the people at large were the druggist to obey the Fourth Commandment?

A. It can not.

Q. You do not keep your store open all night?

A. We do not.

Q. Do you answer night calls?

A. We do.

Q. How many have you answered in the last two years?

A. Six—in a town of 100,000.

Q. Are there other stores nearby that have night clerks?

A. The nearest is two miles away.

Q. You have told me that your store is closed from 10 P. M. to 7:30 A. M., a period of nine and one-half hours out of the twenty-four, and that for a period of two years you have had but six emergency calls, with no other druggist nearby having a night clerk. How do you account for that?

A. We do not advertise that we have a night clerk. The people do not know they would get in. Necessity being the mother of invention they get along with what they have in the house and, if necessary, they summon the doctor, and what they usually need him for is not medicine, but advice. The doctor usually carries his hypodermics, etc., with him and these he uses if necessary. Again, the people are becoming more and more educated. Medicine cabinets are more general in the homes and ignorance of emergency remedies is no longer excusable. So long as the drug store is open the people will come; but when it is closed they wait until it reopens.

Q. If the drug store is closed nine and one-half hours out of every twenty-four, do you not think it a practical plan to close the major part of Sunday and perhaps, ultimately, the entire day?

A. Emphatically so.

Q. You have said that the Sunday drug business varies but little from the week-day business. I ask you now why should not the druggists be as observant of the Sunday selling law as other merchants? Ought they not, as professional men, to consider it a matter of pride to set the example for civic righteousness?

A. In answer to the first part of your question I should say that there is no excuse for the retail druggist not being as observant of the law as any other merchant. To the second, that they ought to consider it a matter of pride from the professional standpoint to set an example for civic righteousness. The fact that, thoughtlessly perhaps, the church people form the bulk of the Sunday trade in toilet accessories, etc., is no excuse for the druggist to sell them.

Q. What benefits do you think would accrue to the retail druggists by the adoption of the Sunday-closing plan? But first tell us what the Sunday-closing plan is.

A. The Sunday-closing plan calls for a closed store on Sunday with the exception of about four hours, when the doors will open for the filling of necessary prescriptions and the sale of sick-room necessities. The benefits will be these, it is confidently expected. (1) An immediate raising of the status of the pharmacists and the pharmaceutical business. (2) An accession to the business of good men who will be drawn to it by love of professional work and because of a scientific bent of mind, but who before kept out because of the Sunday work. (3) The clerks will become better workers and with the accession of good material the wages will rise. (4) The week day business will increase because the people will be more careful to see that they do not "run out" of their drug store needs. (5) The adoption of shorter hours on Sunday will ultimately mean the adoption of shorter hours on week days. (6) The value of shorter hours to the worker is just beginning to be realized. Men who toil unceasingly miss much of the joy of life; their minds become stupid and they live in a rut. The druggists who brag that they

have not had a Sunday "off" in twenty years are an example in point. The druggists are denied the home life—the life most worth while. The benefits that they would gain from this one thing alone are immeasurable. The druggist who has been compelled to leave his wife at home alone, night after night and every other Sunday, with only her thoughts and her work to help her while away the long tedious hours, can understand what it means to have shorter hours and Sunday rest. The long hours and the Sunday work are a curse to the retail drug store of to-day.

Q. Let me ask you a final question: How would you go about putting your plan for Sunday closing into practice if you had a store of your own?

A. I should follow in general the plan adopted by many druggists throughout the United States. I should first inform the people of my plan some time ahead. This I should do by means of circulars enclosed with other advertising matter and mailed in company with bills, or distributed in the store. On that circular I should state just why I believed in Sunday closing and what I proposed to do. I should also inform the physicians, and advertise the fact in the daily papers. I should put cards in my store windows stating the hours my business would be open, and I should respectfully ask the co-operation of my patrons. Having thus put my shoulder to the wheel I should go ahead.

Q. A thought has here suggested itself to me: Suppose there were no financial profit in keeping open on Sunday—that every Sunday that the store was open meant a loss in dollars and cents to the proprietors—do you think there would be much trouble in having all the stores closed on Sunday?

A. I believe there are many sincere and good men doing business on Sunday who believe business could not be conducted in any other way. Many of them have families dependent upon them and of two evils they think it would be worse to let their families want than to close Sundays. They would like to close and would if all the rest could be persuaded to. If the big stores, who can well afford to, will take the initiative, the little stores will be only too glad to fall into line. Every druggist who really believes in the proposition ought to help and encourage those who are working so hard for their interests. "No success is gained without great labor." It is a tremendously big task to win over 50,000 retail druggists to a proposition contrary to the general customs of the drug business. The difficulty of its accomplishment makes the plan all the more worth fighting for. If the conservative, old-school druggists who believe in letting what they call "well enough" alone, will just not antagonize and really make an effort to see the benefits they would receive, it would help a great deal. The long hours and Sunday work of the drug business are not at all in harmony with the twentieth century, and until we modernize our business we cannot have a healthy growth.

[That a goodly proportion of the 50,000 retail druggists do not keep open all day Sunday may be learned by those who will refer to that portion of the report of the recent meeting of the American Pharmaceutical Association appearing in last month's CIRCULAR, page 504.—Editor THE DRUGGISTS CIRCULAR.]

Resting on the Seventh Day.

Scranton, Pa., September 19th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

On my return from the N. A. R. D. convention at Niagara Falls, where the excellent and encouraging report of the committee on fraternal relations regarding the Sunday rest movement of the druggists by the druggists, for the druggists, was so enthusiastically received, I was glad to read in THE DRUGGISTS CIRCULAR for September (page 486) the good and timely letter from the New Jersey pharmacist signed "Sunday Rest," on this important subject. The question is so clearly and convincingly presented therein that I wish every druggist would read it.

The rapid growth of the Sunday rest and shorter hours movement since the St. Louis convention of

1904, when the resolution "fraternally requesting druggists to limit their Sunday business to work of necessity and mercy," was first adopted, is certainly very gratifying, and I am sure with the great assistance promised by the ladies of the W. O. N. A. R. D., through Mrs. President Storer, of Chicago, and Mrs. Secretary Lee, of Philadelphia, the outlook for better Sunday conditions will rapidly grow stronger and stronger for the benefit alike of all concerned—both proprietors and clerks.

JULIUS G. BONE.

"Gettery" and "Forgettery" of College Students.

Pittsburgh, Pa., September 6th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I have read in the CIRCULAR for August, page 425, what Prof. Remington has to say about one's "forgettery." There are some things which we must prevent from falling into that fatal receptacle. For example, a competent pharmacist must not forget that 25° C. and 25° F. are not synonymous. He may forget the rules by which the degrees are transposed, but the fundamental principle that there is a substantial difference must be remembered.

And I want to say that when a graduate in pharmacy has a prescription for zinc sulphate and lead acetate, of each, three grains, water two ounces, and he triturates the chemicals in a mortar, adding the water, and then filters the mixture, I am induced to observe that his "gettery" has not been properly stocked up.

And if he tells me that if one grain of a potent drug is triturated with twelve grains of milk sugar, one grain of the mixture will contain one-twelfth of a grain of the potent drug, then I will say that such graduate has an improper control of his "thinkery," and that he is not a proper person to be placed in a position which entitles him to guide the coming generation of pharmacists, for I am a lover of pharmaceutical progress and college education. I maintain that this class of graduates should remain on the waiting list until their "gettery" is properly stocked, and the storage battery of their "thinkery" is properly charged, and the wires from their "thinkery" to their "gettery" are properly insulated.

I am told that some colleges know very well when they graduate "lame ducks," and that they pass them along with the observation that the responsibility will rest on the pharmacy boards. Now pharmacy boards can afford to take the responsibility, but such colleges should not complain if the boards fail to place their stamp of approval on these weak brethren.

At the present time we need first-class pharmacists or none. Second-class ones, it is claimed, are good enough for rural districts. This I deny, humanity living in rural districts being entitled to as competent service as is that living in urban districts.

Some schools of pharmacy have four grades of graduates, meritorious, very satisfactory, satisfactory, and sufficient. The latter two give pharmacy boards much trouble, and a chronicle of their work makes unpleasant reading for their teachers. They should not be graduated at all by colleges which desire to remain in the "reputable" class, and if pharmacy is to maintain a proper recognition of competency.

LOUIS EMANUEL.

Dispensing Physicians.

Jersey City, N. J., September 12th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Kindly allow me to say a few words in regard to Dr. Hommell's article in your September issue, page 489.

We all agree that higher education and a longer course in the colleges would be a great blessing to the profession, especially in the State of New Jersey, where not even a two years' college course is required for the board examinations. A higher education would elevate our profession, it would bring us closer to the physicians, and consequently we would gain a great deal scientifically and financially. But still, in all, that does not justify the attitude of some doctors, who under false pretenses of incompetency and ignorance of the pharmacists are doing the dispensing work themselves and rob the druggist of his share of profit.

The average reputable and honest druggist of today, licensed or pharmacy graduate, can be intrusted with the filling of a prescription. Those doctors do not dispense for safety's sake, anyway; they simply consider it as a "side line" to help pay their rent.

Suggestions and criticisms are always welcomed by the druggist, but not from those who ignore him.

S. TAUBE.

Saving Time at Druggists' Meetings.

Chicago, Ill., September 16th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Patrick recommended to do away with the front and rear cars on trains to avoid wrecks, as most wrecks are either front or rear collisions.

I notice you are looking for a remedy to float the time schedule of A. Ph. A. meetings. Do away with the first meeting (welcome) and the last (installation), most of which is time-killing and not productive of anything except hot air, and you would cut out a big piece of bunk and poppycock and gain time for session work.

WILHELM BODEMANN.

Persionin, not Pershionin.

Brooklyn, N. Y., September 14th, 1910.

To the Editor of the THE DRUGGISTS CIRCULAR:

In your excellent report of the Boston A. Ph. A. convention, the best and most complete which I have read so far, you call, on page 515, the coloring principle of cudbear *pershionin*. This, of course, should be corrected to *persionin*, from *persio*, the Latin for cudbear. Just as indigo is so named on account of coming from India, so very likely the name *persio* was given to the red dyestuff because it came from Persia, which country used to be the center of exchange between the Orient and the Occident.

Mr. Alexander Gardner, a retail pharmacist of Brooklyn, deserves special credit for commencing these experiments after my talk on N. F. preparations before the Brooklyn Pharmaceutical Association, in which I mentioned the difference of color in different samples of tincture of cudbear, and consequently in the preparations colored with them.

In our preliminary report at Boston we explained that the cudbear is extracted with acetone (Gardner) or alcohol (Raubenheimer), and the resulting tincture dried to an extract or reduced to a powder.

Which of the two solvents is the better, or which of the two products, extract or powder, is the more soluble, remains to be seen. The object is, not to produce a show-globe color, as your readers may think, but to obtain a uniform cudbear extract, which will tint the preparations uniformly.

I trust some of your subscribers will give this process a trial, as it is especially intended for the use of the retail pharmacists. OTTO RAUBENHEIMER.

Federal Positions Open.

October 25th, the United States civil service commission will examine applicants for vacancies in the position of *assistant chemist* in the bureau of chemistry, department of agriculture. These positions are salaried at \$1,200 to \$1,600 a year and are open to men or women more than twenty years old. Applicants must have had an educational training equivalent to the degree of bachelor of science. The examination will consist of tests in theoretical and applied chemistry (organic, physical, and analytical), and translation from French or German. Education, training, experience and fitness will count to 40 per cent. of the rating.

An examination is announced for October 25th and 26th for the position of *junior chemist qualified in explosives*, in the bureau of mines, at a salary of from \$1,020 to \$1,200 a year. The position is open to men only, who are not yet forty years old, and who have had an educational training equivalent to a four-years' technical course, and also had some experience in the analysis or manufacture of explosives. Applicants will be examined in mineralogy, general physics and chemistry, chemistry of explosives, and translation from technical French or German. Each will be required to submit a thesis on a subject relating to explosives.

Also on October 25th and 26th, the commission will examine applicants for vacancies in the position of *laboratory assistant in chemistry* in the bureau of standards, department of commerce and labor. The salary attached to this position ranges from \$900 to \$1,200 a year. Applicants are required to be between the ages of twenty and thirty-five years, and to pass an examination in general physics and chemistry. They must have had an educational training equivalent to graduation from a college or technical school.

Application form 1312 is to be used for any of the foregoing examinations.

What Is "Insect Powder"?

In insecticide decision No. 1, issued August 26th, under the federal insecticide law, the term "insect powder," when used without qualification is defined as "an insecticide made from the powdered flower heads of the following species of chrysanthemum: *Chrysanthemum (pyrethrum) cinerariæfolium* (Trev.); *chrysanthemum (pyrethrum) roseum* (Web. and Mohr); *chrysanthemum marshallii* (Aschers) (*pyrethrum carneum* [M. B.]). Mixtures of powdered flowers and stems of *pyrethrum* may be called "insect powders" if the label bears also a definite statement of the nature of the mixture.

The terms "pyrethrum" and "pyrethrum powder" are held to be synonymous with "insect powder."

Work Against Soothing Syrups.

The Milk and Baby Hygiene Association of Boston is endeavoring to educate mothers to an understanding of the pernicious nature and dangerous possibilities of so-called soothing syrups. To this end it has prepared, from a recent report by Dr. L. F. Kebler, chief of the division of drugs of the federal bureau of chemistry, a poster explaining these dangers and enumerating the commonest mixtures of this sort upon the market.

Dr. James H. Beal, of Scio, Ohio, on September 23d, celebrated the completion of his first half-century on this sphere. The post office at his town was almost "swamped" by the congratulatory messages sent him on that occasion by his friends in all parts of the country. Dr. Beal has been president of the American Pharmaceutical Association and is now its secretary.

President Taft's Decision in the Wiley-Rusby Case.

On September 15th, 1911, the following letter from President Taft, at Beverly, to Secretary of Agriculture Wilson, at Washington, was made public:

I return herewith the papers which you have submitted to me in the matter of the report of the committee on personnel of the department of agriculture, in which, after summarizing the evidence adduced before them, they recommend that Dr. H. H. Rusby, pharmacognocist in the bureau of chemistry, be dismissed from the service; that Dr. L. F. Kebler, chief of the drug laboratory in the bureau of chemistry, be reduced from his present position and that Dr. H. W. Wiley, chief of the bureau of chemistry, and Dr. W. D. Bigelow, assistant chief of the bureau, be given an opportunity to resign from the positions which they now hold in the bureau of chemistry, on account of irregularities in the appointment of Dr. H. H. Rusby.

The facts shown by the papers stated shortly are as follows:

Dr. Rusby lived in New York and was employed as a scientific expert in the bureau of chemistry to examine importations of drugs, under an agreement by which he received \$20 a day for laboratory work and \$50 a day for attendance in court. On May 24th, 1909, the attorney-general advised the secretary of agriculture that, under the act of March 4th, 1907 (34 Stat. 1280), no classified scientific investigator should receive a salary to exceed \$9 a day. On May 29th, 1909, an order was issued putting him on the roll at a salary of \$9 a day when actually employed. Dr. Rusby objected to this and applied to Dr. Kebler, chief of the drug laboratory, to secure a different arrangement. The matter seems to have been held in abeyance for some time.

Finally, as a result of the conference between Dr. Kebler, Dr. Bigelow and Dr. Wiley, with respect to the request of Dr. Rusby for an increased compensation, Dr. Wiley said he would submit to you, for your approval, an appointment of Dr. Rusby at a salary at the rate of \$2,000 per annum on the miscellaneous roll. Dr. Bigelow then wrote to Dr. Rusby under date of January 21st, 1910, as follows:

"Kebler and I took the matter up with Dr. Wiley to-day and he said he would approve it if we had on record an understanding with you so that we could not be held responsible for your receiving an annual salary and not devoting your whole time to the bureau. I told him that if you were given an appointment at the rate of \$170 a month you would agree not to receive more than \$20 a day for time actually employed. By that I mean the usual official day of seven and one-half hours. This would be equivalent to eight and one-half days a month on the average. I told him that if it happened that your work for the department amounted on the average to less time than that you would ask for leave of absence for sufficient time to bring it to that basis."

Dr. Rusby answered this letter and questioned what was meant by it. He said he did not understand Bigelow's letter clearly and supposed that if he did not earn the entire salary he would not expect to receive any more than was earned.

Meantime, on May 6th, Dr. Wiley submitted to you an appointment of Dr. Rusby at a salary at the rate of \$1,600 per annum on the miscellaneous roll. He made the reduction after examining the records and finding the amount of work done by Dr. Rusby during the preceding two years. You approved this appointment.

After the appointment, Dr. Bigelow wrote Dr. Rusby that he thought the present arrangement was better than the former arrangement, when he was receiving \$20 a day for laboratory work and \$50 a day for court work, because, he said, "You are now assured of getting a certain amount each month, irrespective of the time spent, and you can still so plan your work as to interfere with your regular duties to a minimum extent."

This did not satisfy Dr. Rusby, and he sought further information in a letter dated March 3rd, 1911, as follows:

"Kindly recall that on my side the basis of compensation is not less than \$20 per day. At that rate only eighty days' work per year are provided for, and that is not time enough to satisfactorily perform more than the current port work here, leaving no time for examination of interstate samples, especially microscopical examinations or for attendance at court. For every day at court, on the average, one day of preparation is required. The above facts lead to the inquiry, Would not the salary named compel me to either do very much more than eighty days' work per year, or otherwise fail to do the necessary amount of work in a satisfactory manner?"

On March 4th Dr. Kebler wrote to Dr. Rusby, stating among other things the following: "Personally I am of the opinion that your new appointment is much better than the old. Under this appointment you can do as little as one day's work a month and you get your salary. On the other hand, if you work five or ten days your salary would be the same per month. It seems to me that you have the matter largely in your own hands. I am satisfied that if you do not accept the new appointment nothing more can be done, and your services so far as our work is concerned can no longer be utilized materially in the future."

The nub of the charge by the personnel board was that Dr. Wiley, Dr. Kebler, Dr. Bigelow and Dr. Rusby in effect conspired to put on the record a contract for a general employment of Dr. Rusby's services for \$1,600 a year, but actually and secretly made a contract with him, by which he was only to do enough work during the year for the \$1,600 to secure to him a compensation of \$20 a day, and that this was done in deliberate and defiant violation of the law as interpreted by the attorney-general in the opinion already referred to in which he held that congress had limited the compensation of experts to \$9 a day. After you submitted to me the report of the personnel board, I asked the attorney-general to examine it and give me his opinion in respect to the matter, because it concerned the violation of the law as interpreted by him in one of his opinions. He did so and advised me that the rec-

commendations of the personnel board ought to be carried out. In connection with his recommendation he invited attention to a clause in the act of congress approved March 15th, 1898 (30 State L., 316), still in force, that enjoins upon the head of each department the duty of exacting from the employees in that department who are under an annual salary, labor amounting to seven hours a day every day but holidays.

An examination of the records satisfied me that the questions had not been presented to the persons involved in such a way as to enable them to make full defence. They had only been called as witnesses and cross-examined, without a full understanding that they were under trial which might involve their dismissal. Accordingly, I directed you to submit the whole record, together with the opinion of the attorney-general to each one of the persons charged, and invite from him an answer. These answers were filed in due course and are quite full in detail. The answer of Dr. Wiley specifically denies that he ever saw the correspondence between Dr. Kebler and Dr. Rusby, or that he ever consciously entered into an arrangement by which Dr. Rusby was in effect to receive compensation at a rate in excess of that prescribed by the statute as interpreted by the attorney-general. The truth is, it appears from the answers of Dr. Wiley, Dr. Kebler and Dr. Bigelow, that there had been a good many precedents in the department which seemed to justify the employment of Dr. Rusby at an annual salary when it was not expected that his entire time would be taken up.

This was the case with respect to the employment of what was known as the Remsen board. That board was created by order of President Roosevelt for the very important purpose of enabling the secretary of agriculture to have reviewed the decisions of the bureau of chemistry in cases where those decisions involved disputed technical questions and would, if sustained, destroy valuable and profitable business theretofore regarded as lawful. In such cases it was deemed wise not to allow the destruction of what would be otherwise lawful property and business on the decision of only one expert or the head of a bureau. Accordingly, the Remsen board was created of a number of experts, all of whom were known to be engaged in other professional work than that of the reviewing board. Dr. Remsen, the head of the board, occupies an important position in Johns Hopkins University, and that is his principal occupation. Another member, Dr. Russell Chittenden of the Sheffield Scientific School, is dean of that school, and that is his chief vocation. Hence the employment of the Remsen board, at the rate of \$2,000 a year for each member necessarily involved the proposition that such an annual salary might lawfully be paid without requiring labor of seven hours a day from each person so employed. This, the attorney-general in his opinion intimates, is contrary to the statute; but in the agricultural department it was not thought to be the case. Solicitor McCabe, to whom I referred the question of precedents made in the answers, replied that in the practice of the department, the clause in the appropriation act of March 15th, 1898, had been held to have no application to the employment of experts outside of Washington.

It is necessary fully to understand this difference between the attitude of the department toward an employment at an annual salary of this kind and the opinion of the attorney-general in this matter, because if Dr. Wiley and his associates had understood that the \$1,600 annual salary required them to exact from Dr. Rusby seven hours a day for all the work days of the year, then, of course, his employment must have been known by them to be illegal, and under the circumstances to be only a cover for a different contract of employment; but if they understood, as seems to have been the case generally in the agricultural department, that such an employment at an annual salary might be entered into with experts of this kind, and only subject the experts to an obligation to work for the department whenever called upon, with the understanding that they had some other vocation to which their chief attention was given, it clearly reconciles the action of Dr. Wiley with a desire to comply with the law. The recommendation of the attorney-general given to me was upon only part of the evidence, and hence his judgment was different doubtless from what it would have been if he had had the whole record before him, as I have now. It seems fairly clear that Dr. Wiley, after an examination of the records, concluded that the employment of Dr. Rusby at \$9 a day for laboratory work and \$50 a day for court work would amount to \$9,600 a year if the department called on him whenever they needed him, and that it was this arrangement to which you consented.

In Dr. Kebler's anxiety to induce Dr. Rusby to accept the new terms of employment he certainly betrayed a willingness to construe the contract of employment of Dr. Rusby at \$1,600 a year in one way to reconcile it with the law, and in another way to satisfy Dr. Rusby in his wish to secure \$20 a day and I think he ought to be reprimanded for his disingenuous conduct in writing such letters as he did. He said that he did not intend to violate the statute as interpreted by the attorney-general, and indeed that he did not know exactly what the ruling was; but whether he did or not, the language of his letters do not have a commendable tone and suggest a willingness to resort to evasion that calls for official reproof.

In respect to Dr. Rusby, I do not find that he was advised at all as to the legal difficulty, and that he was only seeking for additional compensation which he thought to be adequate. The truth is, the limitations upon bureau chiefs and heads of departments to exact per diem compensation for the employment of experts in such cases as this is a doubtful legislative policy. Here is the pure food act which it is of the highest importance to enforce, and in respect to which the interests opposed to its enforcement are likely to have all the money at their command needed to secure the most effective expert evidence.

The government ought not to be at a disadvantage in this regard, and one can not withhold one's sympathy with an earnest effort by Dr. Wiley to pay proper compensation and secure expert assistance in the enforcement of so important a statute, certainly in the beginning when the questions arising under it are of capital importance to the public. If this were a knowing, wilful, deliberate effort to evade the statute as

construed by the attorney-general, accompanied by a scheme to conceal the evasion and violation, I should think the punishment recommended by the personnel board, and concurred in by the attorney-general, was none too great; but an examination of the whole case satisfies me that a different construction ought to be put upon what was done; that the evidence does not show that Dr. Wiley was a party to the correspondence or the letters upon which the chief charge is founded, and that his action in the matter was only in accord with previous precedents in the department which justified him in doing what he did.

With respect to the other persons charged, I find an overzeal in Dr. Kebler and Dr. Bigelow, which prompted a disingenuous method of squaring Dr. Rusby's desire for what he thought was adequate compensation with the contract which he and Dr. Wiley were willing to make with him, and that for this Dr. Kebler and Dr. Bigelow should be reprimanded by you. So far as Dr. Rusby is concerned with respect to this particular contract, I do not find him at fault. For purposes of punishment or dismissal, I can not charge him with knowledge of the legal difficulties involved in his employment.

I examined the record in this case a number of weeks ago and reached the conclusion which I have stated here; but meantime, a committee of the house of representatives deemed it proper to institute an investigation into the department of agriculture, and especially into the bureau of chemistry and its relation to the department generally. It seemed to me under these conditions that perhaps it was wiser for me to delay until the investigation was completed and the report of the committee made. The committee has not made a report, although I believe the evidence has been substantially closed, and will not do so until the next session of congress. Further consideration satisfies me that there are very much broader questions involved in the investigation and the evidence there brought out than in the present charge which is narrow and definite and can now be properly disposed of. The broader issues raised by the investigation, which have a much weightier relation than this one to the general efficiency of the department, may require much more radical action than the question I have here considered and decided.

There is another charge against Dr. Rusby for securing the appointment, on the common laborers' roll, of a physician and expert whom he could use to do his work at a very small stipend when he himself was called away in other employment. I regret to say that the arrangement which Dr. Rusby thus made is not especially creditable to him, and shakes in some degree one's confidence in his avowed wish to make personal pecuniary sacrifice in the public interest for the enforcement of the pure food law. But Dr. Rusby's position as an expert of high skill and standing is such that I do not think that any more than this expression of opinion should be imposed as penalty. My information is that the government needs his services and that he has already rendered valuable aid. The error referred to, committed by him, should not call for further action or remark.

You will communicate the result to the personnel board and also to the persons charged.

Sincerely yours,
William H. Taft.

Comments on the president's decision and opinions are made in our editorial pages.

Substitution.

By C. W. S., in the New York World.

In poker and in trade,
When a sly move is made
Of course they must sweeten the pot.
They drop in glucose
With a spirit jocose
And observe like as not:

If you object to our superior article of glucose, which is a most excellent product, try some of our benzocate of soda water, good for rheumatism, locomotor ataxia and aneurism of the aorta.

By the right use of checks
Fine syrupus simplex
Is form'd from plain saccharin boil'd,
For sugar at best
Is only a test,
But explain if you're foiled:

Beets when properly macerated and pulverized and mixed with rutabaga turnips may by proper acidulation become a wholesome substitute for molasses, thus reducing household expenses nearly 3 per cent.

But don't forget that Wiley
Is recommended highly
As a substitute for fraud.

F. C. Ewing, of Glenwood Springs, Col., has retired after operating a store there for twenty-four years. He was a member of the Colorado Board of Pharmacy from 1901 to 1903, and sometime its president.

The health inspector of Warsaw, Russia, has ruled that there must be no smoking by proprietor, employee, or customer in any place where medicines are prepared.

Connecticut has a brand new law placing most stringent restrictions round the sale of liquors by druggists.

National Association of Retail Druggists.

Thirteenth Annual Convention, at Niagara Falls, N. Y., September 11th to 15th, 1911.

Everybody knows that Niagara Falls has long ago qualified as a convention site par excellence, and 'twas so that it appeared to the seven-hundred-odd persons officially registered at the meeting of the National Association of Retail Druggists, during the week of September 10th, and the several hundred other visitors to the convention. But somehow the accommodations for a large meeting are not in keeping with the national adaptness of the place, and there was considerable time lost in transferring the delegates from the lobby of the International Hotel to the meeting room in the Cataract House. This however was greatly compensated by the alacrity which President H. B. Guilford instilled into the transactions. Viewed from all sides, the meeting was rather uneventful. No momentous tasks were undertaken because none offered; and no marked changes in policy were entered upon although several plans for making the association of more direct and tangible usefulness to the retail drug trade were taken under consideration. Each of the 223 delegates—a rather small attendance, by the way—was imbued with a healthy interest in the proceedings, and there was always a goodly number before the president.

Cedar Point, Ohio, extended a formal invitation for the 1912 meeting; and it was rumored that Denver, Chicago, Detroit, and New York were seeking the same pleasure.

THE NEW OFFICERS.

By unanimous vote the convention entrusted the supervision of the affairs of the association during the ensuing year to the following officers: President, H. C. Shuptrine, of Savannah, Ga.; vice-presidents, T. B. Cartmell, of Wilmington, Del.; E. A. Bernius, of St. Louis, Mo.; and S. A. Eckstein, of Milwaukee, Wis.; secretary, T. H. Potts, of "the United States at large"; treasurer, H. I. Leith, of Providence, R. I.; and members of the executive committee, C. H. Huhn, of Minneapolis, Minn., chairman; H. W. Merritt, of Plains, Pa.; H. B. Guilford, of Rochester, N. Y.; A. E. Zuber, of Chicago, Ill.; E. H. Thiesing, of Cincinnati, Ohio; and J. A. Bean, of Boston, Mass.

FIRST SITTING.

Monday Evening.

Not even was standing room available in the convention hall of the Cataract House when the visitors assembled for the first sitting of the convention, which opened at the fall of the gavel in the hands of President H. B. Guilford, of Rochester, N. Y., at 9:10 p. m.

A fantasia by the orchestra, a brief invocation of divine guidance by Rev. J. E. Vassar, and the thirteenth annual convention was launched. President Guilford spoke briefly, welcoming the assemblage. He outlined the preparatory work for the success of the meeting and stated that the efforts of the local committee would contribute about \$3,500 to the treasury of the association. The president referred with feeling to the absence of the association's general counsel, Judge J. W. Errant, who had been stricken by apoplexy and was in a precarious condition.

At the introduction of the president Mayor P. J. Keller read a short speech of welcome to his bailiwick. The response to this was one of the treats of the convention, H. C. Shuptrine, of Savannah, Ga., who replied, proving beyond a doubt that oratory is not lost. So thrilling, so remarkable was his description of the grandeur of Niagara that the official welcomer of the city, Maj. O. W. Cutler, was tongue-tied when his time came to speak. Mr. Shuptrine referred also to the progress and the hopes of the association.

Druggist C. E. Zawadski and Maj. O. W. Cutler spoke a few words of welcome on behalf of the local drug trade, to which H. W. Merritt, of Plains, Pa., responded ably.

Next came the reception of delegates from other organizations, the first to be received being Prof. J. H. Beal, who extended the greetings of the American Pharmaceutical Association. Prof. Beal's address was listened to with marked attention. He spoke in disapproval of the matter of the consolidation of the two organizations, but recognized their community of interests and favored a working agreement in matters of policy and aims.

Mrs. W. E. Lee, of Philadelphia, Pa., brought greetings from the Woman's Organization of the National Association of Retail Druggists. She had praise for the accom-

plishments of the N. A. R. D. and called it to the support of the efforts for better food and drugs and cleaner advertising and store displays.

No delegates responded for the National Wholesale Druggists' Association and the Proprietary Association of America.

Announcement was made by the secretary that the president had selected Walter Rothwell, of Pennsylvania, and G. W. Stevens, of Michigan, to act as assistant secretaries during the convention.

The following were named as the committee on credentials: T. S. Armstrong, of New Jersey; J. F. Finneran, of Massachusetts; C. A. Storer, of Illinois; H. C. Frech, of Georgia; and J. J. Chilson, of New York.

The first sitting was then adjourned, at 10:40 o'clock.

HERMAN C. SHUPTRINE.
President National Association of Retail Druggists.

SECOND SITTING.

Tuesday Forenoon.

At 10.05 o'clock, Tuesday morning, the convention assembled for its second sitting. The assistant secretary read a message of regards from the National Association of Pharmacologists, and several messages from absent members.

Vice-President C. P. Gladding, of Hartford, Conn., assumed the chairman's gavel, and President Guilford read his annual message, as follows:

PRESIDENT'S ADDRESS.

In presenting to you my annual report it will be my endeavor to give you in as brief and concise a manner as possible a summary of the work of your national association, and to make such recommendations as I think best with the ultimate object of bettering our conditions.

When I accepted the honor of the presidency of the National Association of Retail Druggists for the year 1911, it was with grave doubts as to my ability to properly manage the affairs of your association. If I have only partially succeeded in maintaining the high standard set by my predecessors I am amply repaid for the efforts I have made.

Thirteen years have passed since the national association saw the light of day; thirteen years of progress and advancement. No one can honestly dispute the fact that we stand to-day the largest organization of retail merchants in the world. We have had our troubles, it is true; but at no time in our history have we been stronger financially or in membership than at the present. We are to-day an association of retail druggists, offset by retail druggists in the interests of retail druggists. Outside influence with us is a specter of the past. We are free from entanglements. The past year has been one of prosperity. Harmony, in all the word implies, has been our watchword. May all the years to come be better than the one just passed.

IMPROVED COMMERCIAL CONDITIONS.

It is a generally accepted fact that commercial conditions in the retail drug trade have been continually improving during the past twelve years. I believe this improvement is due largely to the activities of the N. A. R. D. Possibly we have been chasing some "rainbows" during the past twelve years, but who is there that can honestly say we have not accomplished much—that our "rainbow" chasing has been in vain?

Price protection has been our war cry during the years past, and it must be pleasing to all interested that at last we are assured a plan that guarantees a living profit to the retail druggist. Let me urge upon all loyal members of our association the necessity of doing anything and everything in their power to assist those who father the price-protection plan, and let me suggest that when a contract is submitted to you for signature you sign it at once and thus do your share in welding this endless chain of price protection.

NATIONAL LEGISLATION.

To my mind this is the most important subject for the consideration of our national association. In the past we have been continually on the defensive in legislative matters. It seems to me that the time has arrived for more aggressiveness. Let us frame legislation that we know will benefit the people. Let us again enlarge our legal department and increase the powers of our legislative committee and let us propose legislation that will redound to the everlasting glory of the National Association of Retail Druggists.

Bills are now before congress that if passed will result in great hardship to us, and only by great watchfulness on the part of our legal department, our legislative committee and the co-operation of our members can this unjust legislation be prevented. I would urge that all members of the legislative committee be kept in constant touch with national legislation by reports and that each member of our legislative committee be furnished with a copy of each bill introduced in congress, and that before the chairman of our legislative committee approve or disapprove any particular bill, he first consult with his legislative committee and our legal department. I would further suggest that in an emergency the chairman of the legislative committee be authorized to summon the legislative committee to Washington to appear at hearings on proposed legislation.

INTERSTATE NARCOTIC LEGISLATION.

It is astounding the little interest taken by the retail drug trade in the Foster or Cullom bill introduced into congress some time ago, which provides for the regulation of the sale of habit-forming drugs. The little interest that was manifested was by the retailers of Greater New York, who appeared before the ways and means committee in opposition to this measure as a whole. Representatives of the N. A. R. D. also appeared at this hearing and their position and views clearly indicated that they were not sufficiently alive to the importance and far-reaching influence this bill would have upon the retail drug trade.

The Foster bill makes every handler of the drugs specified in it pay an internal revenue tax. Every package must bear a revenue stamp. The retailer must keep a record of every transaction, every sale of any article containing any quantity, even the most minute, of any of the specified narcotics. He must give such bonds as the commissioner of internal revenue shall prescribe. The commissioner of internal revenue shall frame such regulations as he may see fit for the administration of the law. For any infraction of the law the retailer is liable to a minimum fine of \$500, or a minimum imprisonment of one year, or both.

The immense task laid upon the shoulders of the retail druggist by this bill is obvious. To stamp and record the sale of each of the thousands of articles affected by this bill is beyond the physical power of any ordinary druggist. Then, too, the expense to him for license and bond and necessary clerk hire would be enormous. Prescriptions would have to be suitably recorded, and, in fact, physicians could not dispense unless they were regularly licensed under the act, although hospitals and scientific institutions were exempted. I believe we should make a serious mistake to encourage or endorse a bill of this description.

THE SHERLEY STAMP TAX BILL.

Another bill has been introduced in the lower house of congress by Representative Sherley, of Kentucky, providing for a revival of the stamp tax on patents and proprietaries.

The excuse for this bill is that it is needed to make up for any deficiency in the government's revenues due to the proposed reduction of tariff duties. While it is well for our organization to be on the alert in opposing all such class legislation as the Sherley bill, my opinion is that there is little danger of this bill being seriously considered by congress.

The ways and means committee has given no consideration to the measure, and its author states that he is not urging its passage, and he had no idea that it will be considered at this session. If it should ever be considered a full hearing will be given to all opposed to the bill. It has no active supporters in congress, but many outspoken opponents. There is little likelihood that any general tariff reduction will be made by this congress and therefore there will be no necessity for the enactment of this war revenue measure.

However, eternal vigilance is always the best part of wisdom, and the legislative committee of our organization will be quick to act if there should come any real danger of the Sherley bill becoming a law.

AMENDMENTS TO PURE DRUGS ACT.

The United States supreme court, having decided in the Dr. Johnson "Cancer Cure" case that the pure food and drug act does not give the government any authority to prohibit the printing on labels of claims as to the curative value of any proprietary medicine, President Taft has called upon congress in a special message to amend the law so as to overcome the defect pointed out by the supreme court. In

the lower house a bill for that purpose has been introduced by Representative Sherley and another by Representative Richardson. In the senate a similar bill has been introduced by Senator McCumber. As the highest court declared that the therapeutic effects of a medicinal preparation were largely a matter of opinion and prophecy, great care must be exercised in order to draft a measure that will be sustained by the courts. The law should not be so drastic as to prohibit the sale of all household remedies and thus force everybody to consult a physician for even the slightest ailments. And this organization should not be too hasty in endorsing any of the bills before congress until it is clear that it does not interfere unfairly with the legitimate business of the retail druggist.

Our organization stands for pure drugs and safe medicines at all times, but should not stand for an oppressive monopoly in the sale and dispensing of medicines.

TELEPHONE CONDITIONS.

I wish to congratulate the telephone committee on the splendid success they have achieved in the matter of adjusting telephone difficulties between the retail drug trade and the telephone companies throughout the United States.

The usual commission allowed retail druggists on their telephone calls is 40 per cent. on city messages and 10 per cent. on outside tolls. This I consider a fair compensation to the retail druggist considering the fact that he furnishes rent, heat, light and clerk hire for the maintenance of said telephones.

The American Telephone Company are using their utmost endeavors to reduce this commission, making a flat commission of 10 per cent. on all messages. I consider this reduction unfair and unjust and recommend that our association demand a commission of not less than 40 per cent. and urge our telephone committee to use every honorable means to accomplish this end.

CORDIAL RELATIONS WITH PHYSICIANS.

At the recent meeting of the American Medical Association at Los Angeles, the section of pharmacology and therapeutics made the following recommendation to the main body, which I understand was approved:

"That physicians shall as far as possible relegate to pharmacists the dispensing, and limit to themselves the prescribing of medicines. The proper selection, preservation, preparation, compounding and dispensing of medicines require proper education and training, not included in the course of instruction given in medical schools, but comprised in the courses furnished by the schools of pharmacy."

This is a broad and liberal doctrine, which every N. A. R. D. member can heartily endorse. Our convention should reaffirm its position on this question and at the same time express its emphatic disapproval of counter-prescribing by pharmacists.

The A. M. A. has shown a most commendable spirit of fair play in adopting this recommendation. It will be a powerful factor in strengthening the bonds of friendship and co-operation between physicians and pharmacists. It will do much toward making the "get-together" movement a reality.

U. S. P. AND N. F. PROPAGANDA MOVEMENT.

The report of our propaganda committee will show you that substantial results are being accomplished along this line. The number of physicians prescribing U. S. P. and N. F. preparations is constantly increasing, and the propaganda meetings held in hundreds of cities have done wonders in establishing friendly relations between physicians and pharmacists, to the business and social advantage of both professions. The movement tends to restore pharmacy to its proper rank as a profession, and to increase the confidence of the public in the knowledge and skill of its devotees.

CO-OPERATION.

It must be through genuine co-operation and mutual good will that the greatest usefulness and highest efficiency of our association will be attained. "All for one and one for all" should become a living reality in all our relations with one another and in our loyalty to our common cause. This is the fundamental principle of our organization, and our safety lies in faithful adherence to it in spirit and in truth. It is the sacred ark of our covenant and so long as we hold to it, protect and defend it, so long will we prosper.

With us, co-operation means more than empty theory. It means more than glittering generalities. It means dollars and cents earned for the retail druggist.

When we were organized there was in existence a highly ethical and eminently scientific professional organization of pharmacists, manufacturing proprietors and physicians known as the American Pharmaceutical Association. This body is serving its purpose well in conserving and advancing the professional side of pharmacy. It has taken a conspicuous part in the various revisions of the United States Pharmacopoeia. It is prominent in other scientific works and today is a most important factor in its field. Its record is one which every pharmacist may well be proud of.

Until recently the A. Ph. A. did not much concern itself with the commercial side of pharmacy. Most of its members did not regard the discussion of business questions relating to greater profits for the pharmacists as worthy of a place on the programmes of their conventions. The druggist was not supposed to give much thought to what he should eat or wherewithal he should be clothed. The N. A. R. D. was organized years ago for the particular purpose of regulating, conserving and advancing the commercial side of our profession. At the Louisville convention we endorsed commercial co-operation. We encouraged the formation of buying clubs and manufacturing co-operative associations of retail druggists as the most effective means of protecting these interests. This endorsement was renewed at the Pittsburgh convention and I have no doubt will again be endorsed by this convention. It appears to me that in taking this stand our association acted wisely. Most assuredly co-operation can do the retailer

much good and absolutely no harm. We have the testimony of thousands of retail druggists who have received substantial benefits from participation in co-operative enterprises. Personally I have experienced these advantages and I know whereof I speak, and I dare say the majority here present can give evidence to the same effect.

I am frank to say that I am a firm believer in buying clubs and the more extensive buying and manufacturing enterprises, and I cannot see why any retail druggist or friend of the retail druggist should oppose such enterprises in the face of the overwhelming proof that they increase the legitimate profits of the retailer and place our profession on a more independent foundation.

Whatever we do, let us not take a step backward on the question of co-operation, for I believe in it lies our salvation as independent drug merchants. May we continue to encourage all movements that have for their purpose the improvement of our business and professional conditions.

HONORABLE BUSINESS METHODS.

We have already done much for the education of our members along these lines, but I believe the work should be widened and that everything possible should be done to help our members make more money by all honest means and methods. We should be proud that our association has taken such a strong stand against dishonorable methods of making money in the drug business. We stand firmly against the sale of habit-forming drugs except under proper restrictions, and it has been largely through our efforts that most of the States have regulated such sales.

Our organization has also declared itself against the illegitimate sale of intoxicating liquors in drug stores. In States having the most stringent prohibition laws men have been driven out of the saloon business and have opened drug stores as a blind for the sale of intoxicating liquors, employing a registered pharmacist and continuing their nefarious business under the guise of legitimate pharmacy. Such disreputable stores have been condemned by honorable druggists who have aided the authorities in suppressing them.

NATIONAL EXECUTIVE COMMITTEE.

When I was first introduced to your national executive committee through the office I now occupy, I was surprised and pleased with the way the business of our association was transacted by our executive officers. As a practical business man I wish to say that in my opinion you cannot improve your method of business except possibly in small details.

I believe your executive committee should meet quarterly, January, April, July and September. This would add greatly to the efficiency of your committee. I believe also the office of treasurer should be combined with that of the secretary, which would effect a material saving and facilitate the work of your national headquarters.

N. A. R. D. NOTES.

We have in our publication, Notes, the actual life of our association, and I believe it is due to this splendid publication that our organization is in the good financial condition you find it to-day. I am pleased to congratulate you upon having such a valuable asset. May it continue to grow and improve in the next thirteen years as it has in the past, and may we always find it fighting on the side of right, justice and a square deal for the retail druggist.

PROCTER MEMORIAL.

Let us continue the work of assisting in the erecting of the memorial to William Procter, the father of pharmacy in America. We surely owe a debt of gratitude to the men who have been instrumental in promoting this memorial for their unselfish and untiring efforts.

I recommend that our association appropriate from its treasury \$100 for this memorial rather than resort to the collection which has always been in vogue. This will be a more dignified procedure and all members of our association will then be contributors.

There was collected at the Louisville and Pittsburgh meetings by Dr. Muir, chairman of this committee, the sum of \$269.50, which was remitted to Dr. Whelpley, the treasurer of the A. Ph. A.

N. A. R. D. RELIEF FUND.

This fund has grown until it is now approximately \$5,300. Five thousand dollars of this fund is invested in first mortgage appraised Chicago real estate at 5½ per cent., an absolutely secure investment. I believe that we should yearly add to this fund and when it has reached an amount equal to \$25,000 or more invest this fund in a building of our own, in which we could have our national headquarters, and possibly hold our annual conventions with the annual drug show combined, from which revenue could be derived sufficient for the maintenance of said building.

I look forward with confidence to the realization of this ideal. Our association is founded on a permanent basis; let us have a permanent home for it, a monument to its solidity and at the same time a self-supporting enterprise that may reflect the practical character of our membership.

This year we will derive a considerable profit from our exhibits after all expenses are paid. Let us add this sum to the N. A. R. D. relief fund and thus begin our savings for our permanent home.

NINTH REVISION OF THE U. S. P.

The committee on revision of the U. S. P. has issued its report on admissions and deletions. I strongly recommend that the N. A. R. D. continue to give to the ninth revision every assistance possible in order that the book may be as complete and perfect as it can be made. The U. S. P. is of untold benefit to us all and we should all give our support to the committee of revision regardless of any mistakes in the past.

CONCLUSION.

My friends, let me conclude with these few words. We

should all be optimists to-day. Never in its history has our organization been more united, harmonious and prosperous. Its prestige and influence were never before so great. Its high ideals, righteous policies and substantial achievements have won for it the confidence and respect of the American people. It is universally regarded as one of the most worthy professional organizations.

All dissension in and defection from our ranks have happily been healed, and to-day we stand shoulder to shoulder with hearts beating in unison, with high hopes for a still greater progress and growth. Allow me to congratulate you, fellow members, and you may well felicitate yourselves on the splendid condition of your association and its most encouraging outlook for the future.

Let us guard what we have gained with care. Let us profit by our past mistakes and seek in every honorable way to avoid strife and dissension. Let us always put principle above petty partisanship and the good of pharmacy above the gratification of personal ambition.

I have enjoyed the work of the past year. I prize highly the friends I have made, and appreciate greatly the courteous treatment I have received from the executive committee and our national headquarters, and I trust the section you made for president one year ago has not been a disappointment to you. I have given you the best I could command. I thank you again, gentlemen, for this great honor.

In the customary method of procedure this address was referred to the consideration of the committee on resolutions.

Thomas Stoddart, of New York, made a brief reference to the matter of legislation and telephones touched upon by the president.

Mr. Guilford, having resumed the chair, called for the report of the executive committee, which was presented by the chairman of the committee, C. F. Mann, of Detroit, Mich., and was as follows:

REPORT OF THE EXECUTIVE COMMITTEE.

The work of the executive committee during the year just closing has been more free of complex situations than any since the beginning of the association. The turbulent features of former years and the tantalizing bickering of foreign forces have been almost, if not quite, entirely lacking. This leads us to believe that the policies, positions and work of the association have become so stable as to permanently outweigh the efforts of its critics, and that the N. A. R. D. is more firmly entrenched than ever before to fulfill its mission of protecting, uplifting and promoting the interests of the retail drug trade.

DECISION OF UNITED STATES SUPREME COURT ON DIRECT-CONTRACT-AND-SERIAL-NUMBER PLAN.

Perhaps the question of paramount interest of the year to our members, because of its close relationship to one of the fundamental issues of the association, was the final decision in the case of the Miles Medical Company against John D. Park & Sons. The history of this celebrated case, carried through the various courts, is more or less familiar to all of us, and we will make no attempt to go into its details at this time. (Reference will no doubt be made to it in the report of the legal department as well as in the general discussion of this convention.)

Contrary to the expectation of some, this decision has not been so great a "body blow" to price protection as was anticipated.

The progressiveness shown by the Miles Medical Company in cancelling its old contracts in one breath and putting a new one in force in the next, is powerful evidence that price protection is still a very live issue and one that will not be downed, but one that eventually must endure.

The history of the Miles Medical Company's fight for price protection on the direct agency contract and serial number plan, unequivocally elevates them to the highest pinnacle in loyalty to the retail drug trade, and this convention should manifest its appreciation in such a vigorous and wholehearted manner as to serve as a business object lesson to every other manufacturer marketing his products through the retail drug channels.

PRICE PROTECTION.

Price protection was the issue that had more to do with the inception of the N. A. R. D. than any other question. Through the years of the N. A. R. D. work it has stood out as the great issue. Its success has been attempted in various ways. The legal standing of the various plans proposed for its maintenance have been attacked from all quarters until finally, with the full texts of both the majority and dissenting opinions of the court of last resort, we are just beginning to find the right course to pursue in attaining a living profit for the retailer on proprietaries.

It is confidently expected that the modified Miles contract which follows somewhat the lines of the Freeman contract and which is still in force will stand the test of the courts. The committee is firm in the belief that the demand for price protection should be one of the prominent issues of the N. A. R. D., and that with united effort progress can be made in enlisting the efforts of manufacturers. Most of our failures are due to lack of united and constant effort. It takes perseverance and energy to get anything worth having.

RELATIONS WITH WHOLESALE AND MANUFACTURER.

Time was when the N. A. R. D. laid much stress on its relations with the wholesale and manufacturing trade. The Indianapolis injunction has apparently put almost a complete quietus on the interchange of ideas and the discussion of business relations between the three branches of trade. While your committee has no desire to urge the N. A. R. D. to attempt to unwarrantably circumvent the restraining influence of the Indianapolis injunction, it does believe that

closer relations should be courted than exist at present in merely receiving the delegates of the allied branches of trade and listening to laudatory addresses. There should be some scheme of bringing to the attention of the conventions of the three branches of trade matters of common interest for discussion. This is notably true of legislative matters, for no legislation along drug lines can be intelligently enacted that does not amply consider the manufacturers as well as the various distributors of drugs and medicines. Close relations between the attorneys and legislative committees of the various drug and medical associations should be courted.

CHARLES H. HUHN.

Chairman of the Executive Member of the Executive Committee.

H. B. GUILFORD.

Member of the Executive Committee.

THE SECRETARY'S OFFICE.

The executive committee, through the secretary, is kept in close and constant touch with all the work of the association, receiving at regular intervals reports of the treasurer, the heads of the different departments and those of the standing committees that are doing active work during the year.

The work of the secretary's office has been dispatched with the usual business-like precision, and thorough examination of the office by the executive committee during its mid-year meeting was highly satisfactory to the committee.

The secretary, as has been his custom in former years, has again visited a number of affiliated State associations during their annual meetings. Your committee is convinced that this practice is of inestimable value to the N. A. R. D., bringing, as it does, so many of our affiliated members into direct contact with the active working officer of the association, thereby giving them the intelligence of our work at first hand.

The committee recommends that this practice be extended as far as possible in the future.

PUBLICITY DEPARTMENT.

There is no branch of our work that is watched more carefully by the committee than the development of N. A. R. D. Notes, and we believe the membership at large will agree with the committee in the belief that good progress is being

HENRY W. MERRITT.

Member of the Executive Committee.

E. H. THIESING.

Member of the Executive Committee.

made by this department. Notes is improving yearly in usefulness to our members. Matters of vital importance to the drug trade are dealt with in an impartial way, and the attempt is being made to put matters of general interest to the drug trade before our readers in a way that appeals to the masses rather than the classes.

New departments are being added and the size of the publication is being increased as fast as good business dictates.

The expense of development is being kept in harmony with the increase of revenue from the advertising pages.

The committee aims at all times to co-operate with the director and editor in advancing new features that tend to increase the value and usefulness of the publication to our members.

The advertising pages have been kept quite free from objectionable matter and have increased in keeping with the general enlargement of Notes.

Aside from serving as the great expounder of N. A. R. D. doctrines, Notes continues to aid most materially in keeping the finances of the association in a healthy condition, as will be attested by the treasurer's report.

The committee has no particular recommendation to make other than to impress upon the association the great necessity for the hearty support of the membership in elevating and improving Notes, because of the very important part it plays in the life of the association. The members should be free with impartial criticism as well as with contributions of matters of education and general interest to the trade.

ORGANIZATION DEPARTMENT.

Time continues to demonstrate that the organization department is absolutely essential in keeping and increasing the membership. Various schemes have been tried to curtail the number of field men, but the stubborn fact remains that personal contact with the organizers does more to maintain and increase membership than any other agency yet found.

For the past several years the field men have covered large territories; this has resulted in sending the men into new fields, where the lack of previous acquaintance has been some handicap. Your committee, after careful canvass of the results of the work of the organizers, believe it most essential that more field men be employed and that so far as possible the men be left in the same territory as long as possible. It has been demonstrated that the membership in those States where the same organizers have worked from year to year has been held more intact than where new men were being sent and at irregular intervals.

At the midyear meeting of the committee an advertising scheme for stimulating interest in the association and increasing the membership was favorably acted upon. There

A. E. ZUBER.

J. ARTHUR BEAN.

Member of the Executive Committee.

has hardly enough time elapsed to definitely determine the value of the scheme. The report of the organization department will no doubt touch upon this matter of stimulating interest, and future use of such schemes should be determined by the results that will shortly be manifest.

The work of the department for the year has been very satisfactory and results creditable to the men engaged in this work.

COLLECTION DEPARTMENT.

The results of the simple and inexpensive scheme for collection of bad or dead accounts for our members that was inaugurated last year, have far exceeded expectations. Reports will show the number of accounts collected and the aggregate of money saved for our members through this agency.

Your committee urges the membership to make more general use of this department. This one item in itself can be made to compensate all our members having doubtful accounts on their books, for the payment of dues many times over, if no other benefit were to accrue therefrom.

PROPAGANDA DEPARTMENT.

The propaganda for more ethical and better pharmacy and prescribing has been conducted long enough to convince us of the immense amount of work necessary to bring about great reforms. While comparatively few of our members have lent the co-operation necessary to attain most satisfactory results, those who have are being amply repaid. The efforts of the propaganda committee and propaganda department cannot accomplish the best results without full co-operation of our members, and we again urge our members to embrace the opportunity that the association is giving so much attention in exploiting.

The campaign thus far has followed the original lines started and the committee suggests that the propaganda committee and propaganda department try to originate new and original ideas for the future work of the department. The character of the literature used, while quite satisfactory,

should have frequent changes to renew the interest of the physicians. The same methods will not keep up constant interest.

The results attained are quite satisfactory, considering the many obstacles that must be overcome in this work, and it is the opinion of the committee that propaganda work should continue to occupy a prominent place in our efforts.

LEGAL DEPARTMENT.

Acting on the advice of the Pittsburgh convention, your committee at its midyear meeting weighed very carefully the advisability of extending into larger fields the work of the legal department. While the convention in a broad way passed resolutions for the extension of this feature of our work, many questions entered into the fulfillment of the resolutions. The item of expense is naturally of greatest importance in considering the feasibility of giving greater legal service to our members. And again the lines to follow that will prove of greatest service to the members.

It is fair to assume that the N. A. R. D. occupies the strongest position, because of its system of membership, for the furthering of reforms in the retail drug trade, and we believe the extension of the legal work conducted along careful and well advised lines will prove of greater worth to the association, not alone in aiding to increase membership, but in doing a work for the members that is quite impossible if attempted locally.

The plans outlined for the greater legal department are to furnish as much advice as possible to individual dues-paid members, to aid State associations in State legislation, to originate both State and national laws when deemed advisable, to codify the laws of the various States with the aim of bringing about more uniform legislation, and to extend the legal department of N. A. R. D. Notes in furnishing more legal news and general information to guide our members in the observance of existing laws.

The lateness of the midyear meeting of the committee authorizing the extension of the legal work, made it quite impossible to put into full operation some of the plans suggested, but the general attorney made several trips to State legislatures, aiding the State legislative committees on pending bills as well as furnishing much general information by correspondence. A general outline for future work as well as the work of the year will be made in the report of this department.

The committee has been in full accord with the expansion of this feature of our work, but foresees the danger of entailment of too great expense if the work is extended too rapidly and entirely at N. A. R. D. expense. The expense entailed in time and travel by the general attorney if called upon too frequently by State associations in legislative work may prove a great burden to the association. We believe in this class of work. Arrangements should be made whereby a division of expenses with the State associations will be effected.

[At this juncture Mr. Mann voiced the regret of the committee that illness had prevented the presence of the general counsel, Judge Errant.]

SEATING OF DELEGATES IN CONVENTION.

There has been considerable criticism in the past in the matter of seating ineligible delegates in the conventions. Article III, section 2, of the constitution reads in part as follows: "All delegates shall be actively engaged in the retail drug business." Your committee believes that a strict observance of the constitution by the credentials committee will obviate further criticism and recommends that this course be followed.

STATE OF MEMBERSHIP.

There are annually brought to the attention of the committee a number of instances of impending secessions of affiliated associations. These instances are usually a result of misconception of the work and usefulness of the N. A. R. D., and we are glad to state that such occurrences during the year have been dispelled in most instances by the combined efforts of the secretary's office and stalwart N. A. R. D. members of the association in question.

Reports of the secretary's office will reveal a healthy state of membership and prove that our forces are remaining quite intact. In this connection your committee rejoices with the association in the reaffiliation of the Philadelphia Association of Retail Druggists.

AVOIDANCE OF ENTANGLEMENTS.
